Labor was as completely organized as capital.[107] In fact the passion of the Romans for association shows itself even more clearly here, and it would be possible to write their industrial history from a study of their trades-unions. The story of Rome carries the founding of these guilds back to the early days of the regal period. From the investigations of Waltzing, Liebenam, and others their history can be made out in considerable detail. Roman tradition was delightfully systematic in assigning the founding of one set of institutions to one king and of another group to another king. Romulus, for instance, is the war king, and concerns himself with military and political institutions. The second king, Numa, is a man of peace, and is occupied throughout his reign with the social and religious organization of his people. It was Numa who established guilds of carpenters, dyers, shoemakers, tanners, workers in copper and gold, fluteplayers, and potters. The critical historian looks with a sceptical eye on the story of the kings, and yet this list of trades is just what we should expect to find in primitive Rome. There are no bakers or weavers, for instance, in the list. We know that in our own colonial days the baking, spinning, and weaving were done at home, as they would naturally have been when Rome was a community of shepherds and farmers. As Roman civilization became more complex, industrial specialization developed, and the number of guilds grew, but during the Republic we cannot trace their growth very successfully for lack of information about them. Corporations, as we have seen, played an important part in politics, and their doings are chronicled in the literature, like oratory and history, which deals with public questions, but the trades-guilds had little share in politics; they were made up of the obscure and weak, and consequently are rarely mentioned in the writings of a Cicero or a Livy.

It is only when the general passion for setting down records of all sorts of enterprises and incidents on imperishable materials came in with the Empire that the story of the Roman trades-union can be clearly followed. It is a fortunate thing for us that this mania swept through the Roman Empire, because it has given us some twenty-five hundred inscriptions dealing with these organizations of workmen. These inscriptions disclose the fact that there were more than eighty different trades organized into guilds in the city of Rome alone. They included skilled and unskilled laborers, from the porters, or _saccarii_, to the goldsmiths, or _aurifices_. The

names of some of them, like the _pastillarii_, or guild of pastile-makers, and the _scabillarii_, or castanet-players, indicate a high degree of industrial specialization. From one man's tombstone even the conclusion seems to follow that he belonged to a union of what we may perhaps call checker-board makers. The merchants formed trade associations freely. Dealers in oil, in wine, in fish, and in grain are found organized all over the Empire. Even the perfumers, hay-dealers, and ragmen had their societies. No line of distinction seems to be drawn between the artist and the artisan. The mason and the sculptor were classed in the same category by Roman writers, so that we are not surprised to find unions of men in both occupations. A curious distinction between the professions is also brought out by these guild inscriptions. There are unions made up of physicians, but none of lawyers, for the lawyer in early times was supposed to receive no remuneration for his services. In point of fact the physician was on a lower social plane in Rome than he was even among our ancestors. The profession was followed almost exclusively by Greek freedmen, as we can see from the records on their tombstones, and was highly specialized, if we may judge from the epitaphs of eye and ear doctors, surgeons, dentists, and veterinarians. To the same category with the physician and sculptor belong the architect, the teacher, and the chemist. Men of these professions pursued the _artes liberales_, as the Romans put it, and constituted an aristocracy among those engaged in the trades or lower professions. Below them in the hierarchy came those who gained a livelihood by the _artes ludicræ_, like the actor, professional dancer, juggler, or gladiator, and in the lowest caste were the carpenters, weavers, and other artisans whose occupations were _artes vulgares et sordidæ_.

In the early part of this chapter the tendency of the Romans to form voluntary associations was noted as a national characteristic. This fact comes out very clearly if we compare the number of trades-unions in the Western world with those in Greece and the Orient. Our conclusions must be drawn of course from the extant inscriptions which refer to guilds, and time may have dealt more harshly with the stones in one place than in another, or the Roman government may have given its consent to the establishment of such organizations with more reluctance in one province than another; but, taking into account the fact that we have guild inscriptions from four hundred and seventy-five towns and villages in the Empire, these elements of uncertainty in our conclusions are practically eliminated, and a fair comparison may be drawn between conditions in the East and the West. If we pick out some of the more important towns in the Greek part of the Roman world, we find five guilds reported from Tralles in Caria, six from Smyrna, one from Alexandria, and eleven from Hierapolis in Phrygia. On the other hand, in the city of Rome there were more than one hundred, in Brixia (modern Brescia) seventeen or more, in Lugudunum (Lyons) twenty at least, and in Canabæ, in the province of Dacia, five. These figures, taken at random for some of the larger towns in different parts of the Empire, bring out the fact very clearly that the western and northern provinces readily accepted Roman ideas and showed the Roman spirit, as illustrated in their ability and willingness to co-operate for a common purpose, but that the Greek East was never Romanized. Even in the settlements in Dacia, which continued under Roman rule only from 107 to 270 A.D., we find as many trades-unions as existed in Greek towns which were held by the Romans for three or four centuries. The comparative number of guilds and of guild inscriptions would, in fact, furnish us with a rough test of the extent to which Rome impressed her civilization on different parts of the Empire, even if we had no other criteria. We should know, for instance, that less progress had been made in Britain than in Southern Gaul, that Salona in Dalmatia, Lugudunum in Gaul, and Mogontiacum (Mainz) in Germany were important centres of Roman civilization. It is, of course, possible from a study of these inscriptions to make out the most flourishing industries in the several towns, but with that we are not concerned here.

These guilds which we have been considering were trades-unions in the sense that they were organizations made up of men working in the same trade, but they differed from modern unions, and also from mediaeval guilds, in the objects for which they were formed. They made no attempt to raise wages, to improve working conditions, to limit the number of apprentices, to develop skill and artistic taste in the craft, or to better the social or political position of the laborer. It was the need which their members felt for companionship, sympathy, and help in the emergencies of life, and the desire to give more meaning to their lives, that drew them together. These motives explain the provisions made for social gatherings, and for the burial of members, which were the characteristic features of most of the organizations. It is the social side, for instance, which is indicated on a tombstone, found in a little town of central Italy. After giving the name of the deceased, it reads: "He bequeathed to his guild, the rag-dealers, a thousand sesterces, from the income of which each year, on the festival of the Parentalia, not less than twelve men shall dine at his tomb."[108] Another in northern Italy reads: "To Publius Etereius Quadratus, the son of Publius, of the _Tribus Quirina_, Etereia Aristolais, his mother, has set up a statue, at whose dedication she gave the customary banquet to the union of rag-dealers, and also a sum of money, from the income of which annually, from this time forth, on the birthday of Quadratus, April 9, where his remains have been laid, they should make a sacrifice, and should hold the customary banquet in the temple, and should bring roses in their season and cover and crown the statue; which thing they have undertaken to do."[109] The menu of one of these dinners given in Dacia[110] has come down to us. It includes lamb and pork, bread, salad, onions, and two kinds of wine. The cost

of the entertainment amounted to one hundred and sixty-nine _denarii_, or about twenty-seven dollars, a sum which would probably have a purchasing value to-day of from three to four times that amount.

The "temple" or chapel referred to in these inscriptions was usually semicircular, and may have served as a model for the Christian oratories. The building usually stood in a little grove, and, with its accommodations for official meetings and dinners, served the same purpose as a modern club-house. Besides the special gatherings for which some deceased member or some rich patron provided, the guild met at fixed times during the year to dine or for other social purposes. The income of the society, which was made up of the initiation fees and monthly dues of the members, and of donations, was supplemented now and then by a system of fines. At least, in an African inscription we read: "In the Curia of Jove. Done November 27, in the consulship of Maternus and Atticus.... If any one shall wish to be a flamen, he shall give three amphorae of wine, besides bread and salt and provisions. If any one shall wish to be a magister, he shall give two amphorae of wine.... If any one shall have spoken disrespectfully to a flamen, or laid hands upon him, he shall pay two denarii.... If any one shall have gone to fetch wine, and shall have made away with it, he shall give double the amount."[111]

The provision which burial societies made for their members is illustrated by the following epitaph:

"To the shade of Gaius Julius Filetio, born in Africa, a physician, who lived thirty-five years. Gaius Julius Filetus and Julia Euthenia, his parents, have erected it to their very dear son. Also to Julius Athenodorus, his brother, who lived thirty-five years. Euthenia set it up. He has been placed here, to whose burial the guild of rag-dealers has contributed three hundred denarii."[112] People of all ages have craved a respectable burial, and the pathetic picture which Horace gives us in one of his Satires of the fate which befell the poor and friendless at the end of life, may well have led men of that class to make provisions which would protect them from such an experience, and it was not an unnatural thing for these organizations to be made up of men working in the same trade. The statutes of several guilds have come down to us. One found at Lanuvium has articles dealing particularly with burial regulations. They read in part:[113]

"It has pleased the members, that whoever shall wish to join this guild shall pay an initiation fee of one hundred sesterces, and an amphora of good wine, as well as five _asses_ a month. Voted likewise, that if any man shall not have paid his dues for six consecutive months, and if the lot common to all men has befallen him, his claim to a burial shall not be considered, even if he shall have so stipulated in his will. Voted likewise, that if any man from this body of ours, having paid his dues, shall depart, there shall come to him from the treasury three hundred sesterces, from which sum fifty sesterces, which shall be divided at the funeral pyre, shall go for the funeral rites. Furthermore, the obsequies shall be performed on foot."

Besides the need of comradeship, and the desire to provide for a respectable burial, we can see another motive which brought the weak and lowly together in these associations. They were oppressed by the sense of their own insignificance in society, and by the pitifully small part which they played in the affairs of the world. But if they could establish a society of their own, with concerns peculiar to itself which they would administer, and if they could create positions of honor and importance in this organization, even the lowliest man in Rome would have a chance to satisfy that craving to exercise power over others which all of us feel, to hold titles and distinctions, and to wear the insignia of office and rank. This motive worked itself out in the establishment of a complete hierarchy of offices, as we saw in part in an African inscription given above. The Roman state was reproduced in miniature in these societies, with their popular assemblies, and their officials, who bore the honorable titles of quæstor, curator, prætor, ædile, and so forth.

To read these twenty-five hundred or more inscriptions from all parts of the Empire brings us close to the heart of the common people. We see their little ambitions, their jealousies, their fears, their gratitude for kindness, their own kindliness, and their loyalty to their fellows. All of them are anxious to be remembered after death, and provide, when they can do so, for the celebration of their birthdays by members of the association. A guild inscription in Latium, for instance, reads:[114] "Jan. 6, birthday of Publius Claudius Veratius Abascantianus, [who has contributed] 6,000 sesterces, [paying an annual interest of] 180 denarii." "Jan. 25, birthday of Gargilius Felix, [who has contributed] 2,000 sesterces, [paying an annual interest of] 60 denarii," and so on through the twelve months of the year.

It is not entirely clear why the guilds never tried to bring pressure to bear on their employers to raise wages, or to improve their position by means of the strike, or by other methods with which we are familiar to-day. Perhaps the difference between the ancient and modern methods of manufacture helps us to understand this fact. In modern times most articles can be made much more cheaply by machinery than by hand, and the use of water-power, of steam, and of electricity, and the invention of elaborate

machines, has led us to bring together a great many workmen under one roof or in one factory. The men who are thus employed in a single establishment work under common conditions, suffer the same disadvantages, and are brought into such close relations with one another that common action to improve their lot is natural. In ancient times, as may be seen in the chapter on Diocletian's edict, machinery was almost unknown, and artisans worked singly in their own homes or in the houses of their employers, so that joint action to improve their condition would hardly be expected.

Another factor which should probably be taken into account is the influence of slavery. This institution did not play the important rôle under the Empire in depressing the free laborer which it is often supposed to have played, because it was steadily dying out; but an employer could always have recourse to slave labor to a limited extent, and the struggling freedmen who had just come up from slavery were not likely to urge very strongly their claims for consideration.

In this connection it is interesting to recall the fact that before slavery got a foothold in Rome, the masses in their struggle with the classes used what we think of to-day as the most modern weapon employed in industrial warfare. We can all remember the intense interest with which we watched the novel experience which St. Petersburg underwent some six years ago, when the general strike was instituted. And yet, if we accept tradition, that method of bringing the government and society to terms was used twice by the Roman proletariat over two thousand years ago. The plebeians, so the story goes, unable to get their economic and political rights, stopped work and withdrew from the city to the Sacred Mount. Their abstention from labor did not mean the going out of street lamps, the suspension of street-car traffic, and the closing of factories and shops, but, besides the loss of fighting men, it meant that no more shoes could be had, no more carpentry work done, and no more wine-jars made until concessions should be granted. But, having slaves to compete with it, and with conditions which made organization difficult, free labor could not hope to rise, and the unions could take no serious step toward the improvement of the condition of their members. The feeling of security on this score which society had, warranted the government in allowing even its own employees to organize, and we find unions of government clerks, messengers, and others. The Roman government was, therefore, never called upon to solve the grave political and economic questions which France and Italy have had to face in late years in the threatened strikes of the state railway and postal employees.

We have just been noticing how the ancient differed from the modern trades-union in the objects which it sought to obtain. The religious character which it took seems equally strange to us at first sight. Every guild put itself under the protection of some deity and was closely associated with a cult. Silvanus, the god of the woods, was a natural favorite with the carpenters, Father Bacchus with the innkeepers, Vesta with the bakers, and Diana with those who hunted wild animals for the circus. The reason for the choice of certain other divine patrons is not so clear. Why the cabmen of Tibur, for instance, picked out Hercules as their tutelary deity, unless, like Horace in his Satires, the ancient cabman thought of him as the god of treasure-trove, and, therefore, likely to inspire the giving of generous tips, we cannot guess. The religious side of Roman trade associations will not surprise us when we recall the strong religious bent of the Roman character, and when we remember that no body of Romans would have thought of forming any kind of an organization without securing the sanction and protection of the gods. The family, the clan, the state all had their protecting deities, to whom appropriate rites were paid on stated occasions. Speaking of the religious side of these trade organizations naturally reminds one of the religious associations which sprang up in such large numbers toward the end of the republican period and under the Empire. They lie outside the scope of this chapter, but, in the light of the issue which has arisen in recent years between religious associations and the governments of Italy, France, Spain, and Portugal, it is interesting to notice in passing that the Roman state strove to hold in check many of the ancient religious associations, but not always with much success. As we have noticed, its attitude toward the trade-guilds was not unfriendly. In the last days of the Republic, however, they began to enter politics, and were used very effectively in the elections by political leaders in both parties.[115] In fact the fortunes of the city seemed likely to be controlled by political clubs, until severe legislation and the transfer of the elections in the early Empire from the popular assemblies to the senate put an end to the use of trade associations for political purposes. It was in the light of this development that the government henceforth required all newly formed trades-unions to secure official authorization.

The change in the attitude of the state toward these organizations, as time went on, has been traced by Liebenam in his study of Roman associations. The story of this change furnishes an interesting episode in the history of special privilege, and may not be without profit to us. The Roman government started with the assumption that the operation of these voluntary associations was a matter of public as well as of private concern, and could serve public interests. Therefore their members were to be exempted from some of the burdens which the ordinary citizen bore. It was this reasoning, for instance, which led Trajan to set the bakers free from certain charges, and which influenced Hadrian to grant the same favors to those associations of skippers which supplied Rome with food. In the light of our present-day discussion it is interesting also to find that Marcus Aurelius granted them the right to manumit

slaves and receive legacies--that is, he made them juridical persons. But if these associations were to be fostered by law, in proportion as they promoted the public welfare, it also followed logically that the state could put a restraining hand upon them when their development failed to serve public interests in the highest degree. Following this logical sequence, the Emperor Claudius, in his efforts to promote a more wholesome home life, or for some other reason not known to us, forbade the eating-houses or the delicatessen shops to sell cooked meats or warm water. Antoninus Pius, in his paternal care for the unions, prescribed an age test and a physical test for those who wished to become members. Later, under the law a man was allowed to join one guild only. Such a legal provision as this was a natural concomitant of the concession of privileges to the unions. If the members of these organizations were to receive special favors from the state, the state must see to it that the rolls were not padded. It must, in fact, have the right of final supervision of the list of members. So long as industry flourished, and so long as the population increased, or at least remained stationary, this oversight by the government brought no appreciable ill results. But when financial conditions grew steadily worse, when large tracts of land passed out of cultivation and the population rapidly dwindled, the numbers in the trades-unions began to decline. The public services, constantly growing heavier, which the state required of the guilds in return for their privileges made the loss of members still greater. This movement threatened the industrial interests of the Empire and must be checked at all hazards. Consequently, taking another logical step in the way of government regulation in the interests of the public, the state forbade men to withdraw from the unions, and made membership in a union hereditary. Henceforth the carpenter must always remain a carpenter, the weaver a weaver, and the sons and grandsons of the carpenter and the weaver must take up the occupation of their fathers, and a man is bound forever to his trade as the serf is to the soil.

A Roman Politician

(Gaius Scribonius Curio)

The life of Gaius Scribonius Curio has so many points of interest for the student of Roman politics and society, that one is bewildered by the variety of situations and experiences which it covers. His private character is made up of a _mélange_ of contradictory qualities, of generosity, and profligacy, of sincerity and unscrupulousness. In his public life there is the same facile change of guiding principles. He is alternately a follower of Cicero and a supporter of his bitterest enemy, a Tory and a Democrat, a recognized opponent of Cæsar and his trusted agent and adviser. His dramatic career stirs Lucan to one of his finest passages, gives a touch of vigor to the prosaic narrative of Velleius, and even leads the sedate Pliny to drop into satire.[116] Friend and foe have helped to paint the picture. Cicero, the counsellor of his youth, writes of him and to him; Cælius, his bosom friend, analyzes his character; Cæsar leaves us a record of his military campaigns and death, while Velleius and Appian recount his public and private sins. His story has this peculiar charm, that many of the incidents which make it up are related from day to day, as they occurred, by his contemporaries, Cicero and Cælius, in the confidential letters which they wrote to their intimate friends. With all the strange elements which entered into it, however, his career is not an unusual one for the time in which he lived. Indeed it is almost typical for the class to which he belonged, and in studying it we shall come to know something more of that group of brilliant young men, made up of Cælius, Antony, Dolabella, and others, who were drawn to Cæsar's cause and played so large a part in bringing him success. The life of Curio not only illuminates social conditions in the first century before our era, but it epitomizes and personifies the political history of his time and the last struggles of the Republic. It brings within its compass the Catilinarian conspiracy, the agitation of Clodius, the formation of the first triumvirate, the rivalry of Cæsar and Pompey, and the civil war, for in all these episodes Curio took an active part.

Students of history have called attention to the striking way in which the members of certain distinguished Roman families from generation to generation kept up the political traditions of the family. The Claudian family is a striking case in point. Recognition of this fact helps us to understand Curio. His grandfather and his father were both prominent orators and politicians, as Cicero tells us in his Brutus.[117] The grandfather reached the praetorship in the year in which Gaius Gracchus was done to death by his political opponents, while Curio pater was consul, in 76 B.C., when the confusion which followed the breaking up of the constitution and of the party of Sulla was at its height. Cicero tells us that the second Curio had "absolutely no knowledge of letters," but that he was one of the successful public speakers of his day, thanks to the training which he had received at home. The third Curio, with whom we are concerned here, was prepared for public life as his father had been, for Cicero remarks of him that "although he had not been sufficiently trained by teachers, he had a rare gift for oratory."[118]

On this point Cicero could speak with authority, because Curio had very possibly been one of his pupils in oratory and law. At least the very intimate acquaintance which he has with Curio's character and the incidents of his life, the fatherly tone of Cicero's letters to him, and the fact that Curio's nearest friends were among his disciples make this a natural inference. How intimate this relation

was, one can see from the charming picture which Cicero draws, in the introductory chapters of his Essay on Friendship, of his own intercourse as a young man with the learned Augur Scævola. Roman youth attended their counsellor and friend when he went to the forum to take part in public business, or sat with him at home discussing matters of public and private interest, as Cicero and his companions sat on the bench in the garden with the pontiff Scævola, when he set forth the discourse of Lælius on friendship, and thus, out of his experience, the old man talked to the young men about him upon the conduct of life as well as upon the technical points of law and oratory. So many of the brilliant young politicians of this period had been brought into close relations with Cicero in this way, that when he found himself forced out of politics by the Cæsarians, he whimsically writes to his friend Pætus that he is inclined to give up public life and open a school, and not more than a year before his death he pathetically complains that he has not leisure even to take the waters at the spa, because of the demands which are made upon him for lessons in oratory.

If it did not take us too far from our chosen subject, it would be interesting to stop and consider at length what effect Cicero's intimate relations with these young men had upon his character, his political views, his personal fortunes, and the course of politics. That they kept him young in his interests and sympathies, that they kept his mind alert and receptive, comes out clearly in his letters to them, which are full of jest and raillery and enthusiasm. That he never developed into a Tory, as Catulus did, or became indifferent to political conditions, as Lucullus did, may have been due in part to his intimate association with this group of enthusiastic young politicians. So far as his personal fortunes were concerned, when the struggle between Cæsar and Pompey came, these former pupils of Cicero had an opportunity to show their attachment and their gratitude to him. _They_ were followers of Cæsar, and _he_ cast in his lot with Pompey. But this made no difference in their relations. To the contrary, they gave him advice and help; in their most hurried journeys they found time to visit him, and they interceded with Cæsar in his behalf. To determine whether he influenced the fortunes of the state through the effect which his teachings had upon these young men would require a paper by itself. Perhaps no man has ever had a better opportunity than Cicero had in their cases to leave a lasting impression on the political leaders of the coming generation. Curio, Cælius, Trebatius, Dolabella, Hirtius, and Pansa, who were Cæsar's lieutenants, in the years when their characters were forming and their political tendencies were being determined, were moulded by Cicero. They were warmly attached to him as their guide, philosopher, and friend, and they admired him as a writer, an orator, and an accomplished man of the world. Later they attached themselves to Cæsar, and while they were still under his spell, Cicero's influence over their political course does not seem to count for so much, but after Cæsar's death, the latent effect of Cicero's friendship and teaching makes itself clearly felt in the heroic service which such men as Hirtius and Pansa rendered to the cause of the dying Republic. Possibly even Curio, had he been living, might have been found, after the Ides of March, fighting by the side of Cicero.

Perhaps there is no better way of bringing out the intimate relations which Curio and the other young men of this group bore to the orator than by translating one of Cicero's early letters to him. It was written in 53 B.C., when the young man was in Asia, just beginning his political career as quæstor, or treasurer, on the staff of the governor of that province, and reads:[119]

"Although I grieve to have been suspected of neglect by you, still it has not been so annoying to me that my failure in duty is complained of by you as pleasant that it has been noticed, especially since, in so far as I am accused, I am free from fault. But in so far as you intimate that you long for a letter from me, you disclose that which I know well, it is true, but that which is sweet and cherished--your love, I mean. In point of fact, I never let any one pass, who I think will go to you, without giving him a letter. For who is so indefatigable in writing as I am? From you, on the other hand, twice or thrice at most have I received a letter, and then a very short one. Therefore, if you are an unjust judge toward me, I shall condemn you on the same charge, but if you shall be unwilling to have me do that, you must show yourself just to me.

"But enough about letters; I have no fear of not satisfying you by writing, especially if in that kind of activity you will not scorn my efforts. I _did_ grieve that you were away from us so long, inasmuch as I was deprived of the enjoyment of most delightful companionship, but now I rejoice because, in your absence, you have attained all your ends without sacrificing your dignity in the slightest degree, and because in all your undertakings the outcome has corresponded to my desires. What my boundless affection for you forces me to urge upon you is briefly put. So great a hope is based, shall I say, on your spirit or on your abilities, that I do not hesitate to beseech and implore you to come back to us with a character so moulded that you may be able to preserve and maintain this confidence in you which you have aroused. And since forgetfulness shall never blot out my remembrance of your services to me, I beg you to remember that whatever improvements may come in your fortune, or in your station in life, you would not have been able to secure them, if you had not as a boy in the old days followed my most loyal and loving counsels. Wherefore you ought to have such a feeling toward us, that we, who are now growing heavy with years, may find rest in your love and your youth."

In a most unexpected place, in one of Cicero's fiery invectives against Antony,[120] we come upon an episode illustrating his affectionate care of Curio during Curio's youth. The elder Curio lies upon a couch, prostrate with grief at the wreck which his son has brought on the house by his dissolute life and his extravagance. The younger Curio throws himself at Cicero's feet in tears. Like a foster-father, Cicero induces the young man to break off his evil habits, and persuades the father to forgive him and pay his debts. This scene which he describes here, reminds us of Curio's first appearance in Cicero's correspondence, where, with Curio's wild life in mind, he is spoken of as _filiola Curionis_.[121]

It is an appropriate thing that a man destined to lead so stormy a life as Curio did, should come on the stage as a leader in the wild turmoil of the Clodian affair. What brought the two Curios to the front in this matter as champions of Cicero's future enemy Clodius, it is not easy to say. It is interesting to notice in passing, however, that our Curio enters politics as a Democrat. He was the leader, in fact, of the younger element in that party, of the "Catilinarian crowd," as Cicero styles them, and arrayed himself against Lucullus, Hortensius, Messala, and other prominent Conservatives. What the methods were which Curio and his followers adopted, Cicero graphically describes.[122] They blocked up the entrances to the polling places with professional rowdies, and allowed only one kind of ballots to be distributed to the voters. This was in 61 B.C., when Curio can scarcely have been more than twenty-three years old.

In the following year Cæsar was back in Rome from his successful proprætorship in Spain, and found little difficulty in persuading Pompey and Crassus to join him in forming that political compact which controlled the fortunes of Rome for the next ten years. As a part of the agreement, Cæsar was made consul in 59 B.C., and forced his radical legislation through the popular assembly in spite of the violent opposition of the Conservatives. This is the year, too, of the candidacy of Clodius for the tribunate. Toward both these movements the attitude of Curio is puzzling. He reports to Cicero[123] that Clodius's main object in running for the tribunate is to repeal the legislation of Cæsar. It is strange that a man who had been in the counsels of Clodius, and was so shrewd on other occasions in interpreting political motives, can have been so deceived. We can hardly believe that he was double-faced toward Cicero. We must conclude, I think, that his strong dislike for Cæsar's policy and political methods colored his view of the situation. His fierce opposition to Cæsar is the other strange incident in this period of his life. Most of the young men of the time, even those of good family, were enthusiastic supporters of Cæsar. Curio, however, is bitterly opposed to him.[124] Perhaps he resented Cæsar's repression of freedom of speech, for he tells Cicero that the young men of Rome will not submit to the high-handed methods of the triumvirs, or perhaps he imbibed his early dislike for Cæsar from his father, whose sentiments are made clear enough by a savage epigram at Cæsar's expense, which Suetonius quotes from a speech of the elder Curio.[125] At all events he is the only man who dares speak out. He is the idol of the Conservatives, and is surrounded by enthusiastic crowds whenever he appears in the forum. He is now the recognized leader of the opposition to Cæsar, and a significant proof of this fact is furnished at the great games given in honor of Apollo in the summer of 59. When Cæsar entered the theatre there was faint applause; when Curio entered the crowd rose and cheered him, "as they used to cheer Pompey when the commonwealth was safe."[126] Perhaps the mysterious Vettius episode, an ancient Titus Oates affair, which belongs to this year, reflects the desire of the triumvirs to get rid of Curio, and shows also their fear of his opposition. This unscrupulous informer is said to have privately told Curio of a plot against the life of Pompey, in the hope of involving him in the meshes of the plot. Curio denounced him to Pompey, and Vettius was thrown into prison, where he was afterward found dead, before the truth of the matter could be brought out. Of course Curio's opposition to Cæsar effected little, except, perhaps, in drawing Cæsar's attention to him as a clever politician.

To Curio's quæstorship in Asia reference has already been made. It fell in 53 B.C., and from his incumbency of this office we can make an approximate estimate of his date of birth. Thirty or thirty-one was probably the minimum age for holding the quæstorship at this time, so that Curio must have been born about 84 B.C. From Cicero's letter to him, which has been given above, it would seem to follow that he had performed his duties in his province with eminent success. During his absence from Rome his father died, and with his father's death one stimulating cause of his dislike for Cæsar may have disappeared. To Curio's absence in his province we owe six of the charming letters which Cicero wrote to him. In one of his letters of this year he writes:[127] "There are many kinds of letters, as you well know, but one sort, for the sake of which letter-writing was invented, is best recognized: I mean letters written for the purpose of informing those who are not with us of whatever it may be to our advantage or to theirs that they should know. Surely you are not looking for a letter of this kind from me, for you have correspondents and messengers from home who report to you about your household. Moreover, so far as my concerns go, there is absolutely nothing new. There are two kinds of letters left which please me very much: one, of the informal and jesting sort; the other, serious and weighty. I do not feel that it is unbecoming to adopt either of these styles. Am I to jest with you by letter? On my word I do not think that there is a citizen who can laugh in these days. Or shall I write something of a more serious character? What subject is there on which Cicero can write seriously to Curio, unless it be concerning the commonwealth? And on this matter this is my situation: that I neither dare to set

down in writing that which I think, nor wish to write what I do not think."

The Romans felt the same indifference toward affairs in the provinces that we show in this country, unless their investments were in danger. They were wrapped up in their own concerns, and politics in Rome were so absorbing in 53 B.C. that people in the city probably paid little attention to the doings of a quæstor in the far-away province of Asia. But, as the time for Curio's return approached, men recalled the striking rôle which he played in politics in earlier days, and wondered what course he would take when he came back. Events were moving rapidly toward a crisis. Julia, Cæsar's daughter, whom Pompey had married, died in the summer of 54 B.C., and Crassus was defeated and murdered by the Parthians in 53 B.C. The death of Crassus brought Cæsar and Pompey face to face, and Julia's death broke one of the strongest bonds which had held these two rivals together. Cæsar's position, too, was rendered precarious by the desperate struggle against the Belgæ, in which he was involved in 53 B.C. In Rome the political pot was boiling furiously. The city was in the grip of the bands of desperadoes hired by Milo and Clodius, who broke up the elections during 53 B.C., so that the first of January, 52, arrived with no chief magistrates in the city. To a man of Curio's daring and versatility this situation offered almost unlimited possibilities, and recognizing this fact, Cicero writes earnestly to him,[128] on the eve of his return, to enlist him in support of Milo's candidacy for the consulship. Curio may have just arrived in the city when matters reached a climax, for on January 18, 52 B.C., Clodius was killed in a street brawl by the followers of Milo, and Pompey was soon after elected sole consul, to bring order out of the chaos, if possible.

Curio was not called upon to support Milo for the consulship, because Milo's share in the murder of Clodius and the elevation of Pompey to his extra-constitutional magistracy put an end to Milo's candidacy. What part he took in supporting or in opposing Pompey's reform legislation of 52 B.C., and what share he had in the preliminary skirmishes between Cæsar and the senate during the early part of 51, we have no means of knowing. As the situation became more acute, however, toward the end of the year, we hear of him again as an active political leader. Cicero's absence from Rome from May, 51 to January, 49 B.C., is a fortunate thing for us, for to it we owe the clever and gossipy political letters which his friend Cælius sent him from the capital. In one of these letters, written August 1, 51 B.C., we learn that Curio is a candidate for the tribunate for the following year, and in it we find a keen analysis of the situation, and an interesting, though tantaizingly brief, estimate of his character. Coming from an intimate friend of Curio, it is especially valuable to us. Cælius writes:[129] "He inspires with great alarm many people who do not know him and do not know how easily he can be influenced, but judging from my hopes and wishes, and from his present behavior, he will prefer to support the Conservatives and the senate. In his present frame of mind he is simply bubbling over with this feeling. The source and reason of this attitude of his lies in the fact that Cæsar, who is in the habit of winning the friendship of men of the worst sort at any cost whatsoever, has shown a great contempt for him. And of the whole affair it seems to me a most delightful outcome, and the view has been taken by the rest, too, to such a degree that Curio, who does nothing after deliberation, seems to have followed a definite policy and definite plans in avoiding the traps of those who had made ready to oppose his election to the tribunate--I mean the Lælii, Antonii, and powerful people of that sort." Without strong convictions or a settled policy, unscrupulous, impetuous, radical, and changeable, these are the qualities which Cælius finds in Curio, and what we have seen of his career leads us to accept the correctness of this estimate. In 61 he had been the champion of Clodius, and the leader of the young Democrats, while two years later we found him the opponent of Cæsar, and an ultra-Conservative. It is in the light of his knowledge of Curio's character, and after receiving this letter from Cælius, that Cicero writes in December, 51 B.C., to congratulate him upon his election to the tribunate. He begs him "to govern and direct his course in all matters in accordance with his own judgment, and not to be carried away by the advice of other people." "I do not fear," he says, "that you may do anything in a fainthearted or stupid way, if you defend those policies which you yourself shall believe to be right.... Commune with yourself, take yourself into counsel, hearken to yourself, determine your own policy."

The other point in the letter of Cælius, his analysis of the political situation, so far as Curio is concerned, is not so easy to follow. Cælius evidently believes that Curio had coquetted with Cæsar and had been snubbed by him, that his intrigues with Cæsar had at first led the aristocracy to oppose his candidacy, but that Cæsar's contemptuous treatment of his advances had driven him into the arms of the senatorial party. It is quite possible, however, that an understanding may have been reached between Cæsar and Curio even at this early date, and that Cæsar's coldness and Curio's conservatism may both have been assumed. This would enable Curio to pose as an independent leader, free from all obligations to Cæsar, Pompey, or the Conservatives, and anxious to see fair play and safeguard the interests of the whole people, an independent leader who was driven over in the end to Cæsar's side by the selfish and factious opposition of the senatorial party to his measures of reform and his advocacy of even-handed justice for both Cæsar and Pompey.[130]

Whether Curio came to an understanding with Cæsar before he entered on his tribunate or not, his policy from the outset was well calculated to make the transfer of his allegiance seem forced upon him, and to help him carry over to Cæsar the support of those who were not blinded by partisan feelings. Before he had been in office a fortnight he brought in a bill which would have annulled the law, passed by Cæsar in his consulship, assigning land in Campania to Pompey's veterans.[131] The repeal of this law had always been a favorite project with the Conservatives, and Curio's proposal seemed to be directed equally against Cæsar and Pompey. In February of 50 B.C. he brought in two bills whose reception facilitated his passage to the Cæsarian party. One of them provided for the repair of the roads, and, as Appian tells us,[132] although "he knew that he could not carry any such measure, he hoped that Pompey's friends would oppose him so that he might have that as an excuse for opposing Pompey." The second measure was to insert an intercalary month. It will be remembered that before Cæsar reformed the calendar, it was necessary to insert an extra month in alternate years, and 50 B.C. was a year in which intercalation was required. Curio's proposal was, therefore, a very proper one. It would recommend itself also on the score of fairness. March 1 had been set as the day on which the senate should take up the question of Cæsar's provinces, and after that date there would be little opportunity to consider other business. Now the intercalated month would have been inserted, in accordance with the regular practice, after February 23, and by its insertion time would have been given for the proper discussion of the measures which Curio had proposed. Incidentally, and probably this was in Curio's mind, the date when Cæsar might be called upon to surrender his provinces would be postponed. The proposal to insert the extra month was defeated, and Curio, blocked in every move by the partisan and unreasonable opposition of Pompey and the Conservatives, found the pretext for which lie had been working, and came out openly for Cæsar.[133] Those who knew him well were not surprised at the transfer of his allegiance. It was probably in fear of such a move that Cicero had urged him not to yield to the influence of others, and when Cicero in Cilicia hears the news, he writes to his friend Cælius: "Is it possible? Curio is now defending Cæsar! Who would have expected it?--except myself, for, as surely as I hope to live, _I_ expected it. Heavens! how I miss the laugh we might have had over it." Looking back, as we can now, on the political rôle which Curio played during the next twelve months, it seems strange that two of his intimate friends, who were such far-sighted politicians as Cicero and Cælius were, should have underestimated his political ability so completely. It shows Cæsar's superior political sagacity that he clearly saw his qualities as a leader and tactician. What terms Cæsar was forced to make to secure his support we do not know. Gossip said that the price was sixty million sesterces,[134] or more than two and a half million dollars. He was undoubtedly in great straits. The immense sums which he had spent in celebrating funeral games in honor of his father had probably left him a bankrupt, and large amounts of money were paid for political services during the last years of the republic. Naturally proof of the transaction cannot be had, and even Velleius Paterculus, in his savage arraignment of Curio,[135] does not feel convinced of the truth of the story, but the tale is probable.

It was high time for Cæsar to provide himself with an agent in Rome. The month of March was near at hand, when the long-awaited discussion of his provinces would come up in the senate. His political future, and his rights as a citizen, depended upon his success in blocking the efforts of the senate to take his provinces from him before the end of the year, when he could step from the proconsulship to the consulship. An interval of even a month in private life between the two offices would be all that his enemies would need for bringing political charges against him that would effect his ruin. His displacement before the end of the year must be prevented, therefore, at all hazards. To this task Curio addressed himself, and with surpassing adroitness. He did not come out at once as Cæsar's champion. His function was to hold the scales true between Cæsar and Pompey, to protect the Commonwealth against the overweening ambition and threatening policy of both men. He supported the proposal that Cæsar should be called upon to surrender his army, but coupled with it the demand that Pompey also should be required to give up his troops and his proconsulship. The fairness of his plan appealed to the masses, who would not tolerate a favor to Pompey at Cæsar's expense. It won over even a majority of the senate. The cleverness of his policy was clearly shown at a critical meeting of the senate in December of the year 50 B.C. Appian tells us the story:[136] "In the senate the opinion of each member was asked, and Claudius craftily divided the question and took the votes separately, thus: 'Shall Pompey be deprived of his command?' The majority voted against the latter proposition, and it was decreed that successors to Cæsar should be sent. Then Curio put the question whether both should lay down their commands, and twenty-two voted in the negative, while three hundred and seventy went back to the opinion of Curio in order to avoid civil discord. Then Claudius dismissed the senate, exclaiming: 'Enjoy your victory and have Cæsar for a master!'" The senate's action was vetoed, and therefore had no legal value, but it put Cæsar and Curio in the right and Pompey' s partisans in the wrong.

As a part of his policy of defending Cæsar by calling attention to the exceptional position and the extra-constitutional course of Pompey, Curio offset the Conservative attacks on Cæsar by public speeches fiercely arraigning Pompey for what he had done during his consulship, five years before. When we recall Curio's biting wit and sarcasm, and the unpopularity of Pompey's

high-handed methods of that year, we shall appreciate the effectiveness of this flank attack.

Another weapon which he used freely was his unlimited right of veto as tribune. As early as April Cælius appreciated how successful these tactics would be, and he saw the dilemma in which they would put the Conservatives, for he writes to Cicero: "This is what I have to tell you: if they put pressure at every point on Curio, Cæsar will defend his right to exercise the veto; if, as seems likely, they shrink [from overruling him], Cæsar will stay [in his province] as long as he likes." The veto power was the weapon which he used against the senate at the meeting of that body on the first of December, to which reference has already been made. The elections in July had gone against Cæsar. Two Conservatives had been returned as consuls. In the autumn the senate had found legal means of depriving Cæsar of two of his legions. Talk of a compromise was dying down. Pompey, who had been desperately ill in the spring, had regained his strength. He had been exasperated by the savage attacks of Curio. Sensational stories of the movements of Cæsar's troops in the North were whispered in the forum, and increased the tension. In the autumn, for instance, Cæsar had occasion to pay a visit to the towns in northern Italy to thank them for their support of Mark Antony, his candidate for the tribunate, and the wild rumor flew to Rome that he had advanced four legions to Placentia,[137] that his march on the city had begun, and tumult and confusion followed. It was in these circumstances that the consul Marcellus moved in the senate that successors be sent to take over Cæsar's provinces, but the motion was blocked by the veto of Curio, whereupon the consul cried out: "If I am prevented by the vote of the senate from taking steps for the public safety, I will take such steps on my own responsibility as consul." After saying this he darted out of the senate and proceeded to the suburbs with his colleague, where he presented a sword to Pompey, and said: "My colleague and I command you to march against Cæsar in behalf of your country, and we give you for this purpose the army now at Capua, or in any other part of Italy, and whatever additional forces you choose to levy."[138] Curio had accomplished his purpose. He had shown that Pompey as well as Cæsar was a menace to the state; he had prevented Cæsar's recall; he had shown Antony, who was to succeed him in the tribunate, how to exasperate the senate into using coercive measures against his sacrosanct person as tribune and thus justify Cæsar's course in the war, and he had goaded the Conservatives into taking the first overt step in the war by commissioning Pompey to begin a campaign against Cæsar without any authorization from the senate or the people.

The news of the unconstitutional step taken by Marcellus and Pompey reached Rome December 19 or 20. Curio's work as tribune was done, and on the twenty-first of the month he set out for the North to join his leader. The senate would be called together by the new consuls on January 1, and since, before the reform in the calendar, December had only twenty-nine days, there were left only eight days for Curio to reach Cæsar's head-quarters, lay the situation before him, and return to the city with his reply. Ravenna, where Cæsar had his head-quarters, was two hundred and forty miles from Rome. He covered the distance, apparently, in three days, spent perhaps two days with Cæsar, and was back in Rome again for the meeting of the senate on the morning of January 1. Consequently, he travelled at the rate of seventy-five or eighty miles a day, twice the rate of the ordinary Roman courier.

We cannot regret too keenly the fact that we have no account of Curio's meeting with Cæsar, and his recital to Cæsar of the course of events in Rome. In drawing up the document which was prepared at this conference, Cæsar must have been largely influenced by the intimate knowledge which Curio had of conditions in the capital, and of the temper of the senate. It was an ultimatum, and, when Curio presented it to the senate, that body accepted the challenge, and called upon Cæsar to lay down his command on a specified date or be declared a public enemy. Cæsar replied by crossing the border of his province and occupying one town after another in northern Italy in rapid succession. All this had been agreed upon in the meeting between Curio and Cæsar, and Velleius Paterculus[139] is probably right in putting the responsibility for the war largely on the shoulders of Curio, who, as he says, brought to naught the fair terms of peace which Cæsar was ready to propose and Pompey to accept. The whole situation points to the conclusion that Cæsar did not desire war, and was not prepared for it. Had he anticipated its immediate outbreak, he would scarcely have let it arise when he had only one legion with him on the border, while his other ten legions were a long distance away.

From the outset Curio took an active part in the war which he had done so much to bring about, and it was an appropriate thing that the closing events in his life should have been recorded for us by his great patron, Cæsar, in his narrative of the Civil War. On the 18th or 19th of January, within ten days of the crossing of the Rubicon, we hear of his being sent with a body of troops to occupy Iguvium,[140] and a month later he is in charge of one of the investing camps before the stronghold of Corfinium.[141] With the fall of Corfinium, on the 21st of February, Cæsar's rapid march southward began, which swept the Pompeians out of Italy within a month and gave Cæsar complete control of the peninsula. In that brilliant campaign Curio undoubtedly took an active part, for at the close of it Cæsar gave him an independent commission for the occupation of Sicily and northern Africa. No more important command could have been given him, for Sicily and Africa were the granaries of Rome, and if the Pompeians continued to hold

them, the Cæsarians in Italy might be starved into submission. To this ill-fated campaign Cæsar devotes the latter half of the second book of his Civil War. In the beginning of his account of it he remarks: "Showing at the outset a total contempt for the military strength of his opponent, Publius Attius Varus, Curio crossed over from Sicily, accompanied by only two of the four legions originally given him by Cæsar, and by only five hundred cavalry."[142] The estimate which Cælius had made of him was true, after all, at least in military affairs. He was bold and impetuous, and lacked a settled policy. Where daring and rapidity of movement could accomplish his purpose, he succeeded, but he lacked patience in finding out the size and disposition of the enemy's forces and calmness of judgment in comparing his own strength with that of his foe. It was this weakness in his character as a military leader which led him to join battle with Varus and Juba's lieutenant, Saburra, without learning beforehand, as he might have done, that Juba, with a large army, was encamped not six miles in the rear of Saburra. Curio's men were surrounded by the enemy and cut down as they stood. His staff begged him to seek safety in flight, but, as Cæsar writes,[143] "He answered without hesitation that, having lost the army which Cæsar had entrusted to his charge, he would never return to look him in the face, and with that answer he died fighting."

Three years later the fortunes of war brought Cæsar to northern Africa, and he traversed a part of the region where Curio's luckless campaign had been carried on. With the stern eye of the trained soldier, he marked the fatal blunders which Curio had made, but he recalled also the charm of his personal qualities, and the defeat before Utica was forgotten in his remembrance of the great victory which Curio had won for him, single-handed, in Rome. Even Lucan, a partisan of the senate which Curio had flouted, cannot withhold his admiration for Curio's brilliant career, and his pity for Curio's tragic end. As he stands in imagination before the fallen Roman leader, he exclaims:[144] "Happy wouldst thou be, O Rome, and destined to bless thy people, had it pleased the gods above to guard thy liberty as it pleased them to avenge its loss. Lo! the noble body of Curio, covered by no tomb, feeds the birds of Libya. But to thee, since it profiteth not to pass in silence those deeds of thine which their own glory defends forever 'gainst the decay of time, such tribute now we pay, O youth, as thy life has well deserved. No other citizen of such talent has Rome brought forth, nor one to whom the law would be indebted more, if he the path of right had followed out. As it was, the corruption of the age ruined the city when desire for office, pomp, and the power which wealth gives, ever to be dreaded, had swept away his wavering mind with sidelong flood, and the change of Curio, snared by the spoils of Gaul and the gold of Cæsar, was that which turned the tide of history. Although mighty Sulla, fierce Marius, the blood-bespattered Cinna, and all the line of Cæsar's house have held our throats at their mercy with the sword, to whom was e'er such power vouchsafed? All others bought, _he_ sold the state."

Gaius Matius, a Friend of Cæsar

"_Non enim Cæsarem ... sum secutus, sed amicum_."

Gaius Matius, the subject of this sketch, was neither a great warrior, nor statesman, nor writer. If his claim to remembrance rested on what he did in the one or the other of these rôles, he would long ago have been forgotten. It is his genius for friendship which has kept his memory green, and that is what he himself would have wished. Of his early life we know little, but it does not matter much, because the interest which he has for us centres about his relations to Cæsar in early manhood. Being of good birth, and a man of studious tastes, he probably attended the University at Athens, and heard lectures there as young Cicero and Messala did at a later period. He must have been a man of fine tastes and cultivation, for Cicero, in writing to a friend, bestows on Matius the title "doctissimus," the highest literary compliment which one Roman could pay another, and Apollodorus of Pergamum dedicated to him his treatise on rhetoric. Since he was born about 84 B.C., he returned from his years of study at Athens about the time when Cæsar was setting out on his brilliant campaign in Gaul. Matius joined him, attracted perhaps by the personal charms of the young proconsul, perhaps by the love of adventure, perhaps, like his friend Trebatius, by the hope of making a reputation.

At all events he was already with Cæsar somewhere in Gaul in 53 B.C., and it is hard to think of an experience better suited to lay bare the good and the bad qualities in Cæsar's character than the years of camp life which Matius spent with him in the wilds of Gaul and Britain. As aide-de-camp, or orderly, for such a position he probably held, his place was by Cæsar's side. They forded the rivers together, walked or rode through woodland or open side by side, shared the same meagre rations, and lay in the same tent at the end of the day's march, ready to spring from the ground at a moment's warning to defend each other against attack from the savage foe. Cæsar's narrative of his campaigns in Gaul is a soldier's story of military movements, and perhaps from our school-boy remembrance of it we may have as little a liking for it as Horace had for the poem of Livius Andronicus, which he studied under "Orbilius of the rods," but even the obscurities of the Latin subjunctive and ablative cannot have blinded us entirely to the romance of the desperate siege of Alesia and the final struggle which the Gauls made to drive back the invader. Matius shared with Cæsar all the hardships and perils of that campaign, and with Cæsar he witnessed the final scene of the tragedy when Vercingetorix, the

heroic Gallic chieftain, gave up his sword, and the conquest of Gaul was finished. It is little wonder that Matius and the other young men who followed Cæsar were filled with admiration of the man who had brought all this to pass.

It was a notable group, including Trebatius, Hirtius, Pansa, Oppius, and Matius in its number. All of them were of the new Rome. Perhaps they were dimly conscious that the mantle of Tiberius Gracchus had fallen upon their leader, that the great political struggle which had been going on for nearly a century was nearing its end, and that they were on the eve of a greater victory than that at Alesia. It would seem that only two of them, Matius and Trebatius, lived to see the dawning of the new day. But it was not simply nor mainly the brilliancy of Cæsar as a leader in war or in politics which attracted Matius to him. As he himself puts it in his letter to Cicero: "I did not follow a Cæsar, but a friend." Lucullus and Pompey had made as distinguished a record in the East as Cæsar had in the West, but we hear of no such group of able young men following their fortunes as attached themselves to Cæsar. We must find a reason for the difference in the personal qualities of Cæsar, and there is nothing that more clearly proves the charm of his character than the devotion to him of this group of men. In the group Matius is the best representative of the man and the friend. When Cæsar came into his own, Matius neither asked for nor accepted the political offices which Cæsar would gladly have given him. One needs only to recall the names of Antony, Labienus, or Decimus Brutus to realize the fact that Cæsar remembered and rewarded the faithful services of his followers. But Matius was Cæsar's friend and nothing more, not his master of the horse, as Antony was, nor his political and financial heir, as Octavius was. In his loyalty to Cæsar he sought for no other reward than Cæsar's friendship, and his services to him brought with them their own return. Indeed, through his friend he suffered loss, for one of Cæsar's laws robbed him of a part of his estate, as he tells us, but this experience did not lessen his affection. How different his attitude was from that of others who professed a friendship for Cæsar! Some of them turned upon their leader and plotted against his life, when disappointed in the favors which they had received at his hands, and others, when he was murdered, used his name and his friendship for them to advance their own ambitious designs. Antony and Octavius struggle with each other to catch the reins of power which have fallen from his hands; Dolabella, who seems to regard himself as an understudy of Cæsar, plays a serio-comic part in Rome in his efforts to fill the place of the dead dictator; while Decimus Brutus hurries to the North to make sure of the province which Cæsar had given him.

From these men, animated by selfishness, by jealousy, by greed for gain, by sentimentalism, or by hypocritical patriotism, Matius stands aloof, and stands perhaps alone. For him the death of Cæsar means the loss of a friend, of a man in whom he believed. He can find no common point of sympathy either with those who rejoice in the death of the tyrant, as Cicero does, for he had not thought Cæsar a tyrant, nor with those who use the name of Cæsar to conjure with. We have said that he accepted no political office. He did accept an office, that of procurator, or superintendent, of the public games which Cæsar had vowed on the field of Pharsalus, but which death had stepped in to prevent him from giving, and it was in the pious fulfilment of this duty which he took upon himself that he brought upon his head the anger of the "auctores libertatis," as he ironically calls them. He had grieved, too, at the death of Cæsar, although "a man ought to rate the fatherland above a friend," as the liberators said. Matius took little heed of this talk. He had known of it from the outset, but it had not troubled him. Yet when it came to his ears that his friend Cicero, to whom he had been attached from boyhood, to whom he had proved his fidelity at critical moments, was among his accusers, he could not but complain bitterly of the injustice. Through a common friend, Trebatius, whose acquaintance he had made in Gaul, he expresses to Cicero the sorrow which he feels at his unkindness. What Cicero has to say in explanation of his position and in defence of himself, we can do no better than to give in his own words:

"_Cicero to Matins, greeting:_[145]

"I am not yet quite clear in my own mind whether our friend Trebatius, who is as loyal as he is devoted to both of us, has brought me more sorrow or pleasure: for I reached my Tusculan villa in the evening, and the next day, early in the morning, he came to see me, though he had not yet recovered his strength. When I reproved him for giving too little heed to his health, he said that nothing was nearer his heart than seeing me. 'There's nothing new,' say I? He told me of your grievance against me, yet before I make any reply in regard to it, let me state a few facts.

"As far back as I can recall the past I have no friend of longer standing than you are; but long duration is a thing characteristic of many friendships, while love is not. I loved you on the day I met you, and I believed myself loved by you. Your subsequent departure, and that too for a long time, my electoral canvass, and our different modes of life did not allow our inclination toward one another to be strengthened by intimacy; still I saw your feeling toward me many years before the Civil War, while Cæsar was in Gaul; for the result which you thought would be of great advantage to me and not of disadvantage to Cæsar himself you accomplished: I mean in bringing him to love me, to honor me, to regard me as one of his friends. Of the many confidential

communications which passed between us in those days, by word of mouth, by letter, by message, I say nothing, for sterner times followed. At the breaking out of the Civil War, when you were on your way toward Brundisium to join Cæsar, you came to me to my Formian villa. In the first place, how much did that very fact mean, especially at those times! Furthermore, do you think I have forgotten your counsel, your words, the kindness you showed? I remember that Trebatius was there. Nor indeed have I forgotten the letter which you sent to me after meeting Cæsar, in the district near Trebula, as I remember it. Next came that ill-fated moment when either my regard for public opinion, or my sense of duty, or chance, call it what you will, compelled me to go to Pompey. What act of kindness or thoughtfulness either toward me in my absence or toward my dear ones in Rome did you neglect? In fact, whom have all my friends thought more devoted to me and to themselves than you are? I came to Brundisium. Do you think I have forgotten in what haste, as soon as you heard of it, you came hurrying to me from Tarentum? How much your presence meant to me, your words of cheer to a courage broken by the fear of universal disaster! Finally, our life at Rome began. What element did our friendship lack? In most important matters I followed your advice with reference to my relations toward Cæsar; in other matters I followed my own sense of duty. With whom but myself, if Cæsar be excepted, have you gone so far as to visit his house again and again, and to spend there many hours, oftentimes in the most delightful discourse? It was then too, if you remember, that you persuaded me to write those philosophical essays of mine. After his return, what purpose was more in your thoughts than to have me as good a friend of Cæsar as possible? This you accomplished at once.

"What is the point, then, of this discourse, which is longer than I had intended it should be? This is the point, that I have been surprised that you, who ought to see these things, have believed that I have taken any step which is out of harmony with our friendly relations, for beside these facts which I have mentioned, which are undisputed and self-evident facts, there are many more intimate ties of friendship which I can scarcely put in words. Everything about you charms me, but most of all, on the one hand, your perfect loyalty in matters of friendship, your wisdom, dignity, steadfastness; on the other hand, your wit, refinement, and literary tastes.

"Wherefore--now I come back to the grievance--in the first place, I did not think that you had voted for that law; in the second place, if I had thought so, I should never have thought that you had done it without some sufficient reason. Your position makes whatever you do noticeable; furthermore, envy puts some of your acts in a worse light than the facts warrant. If you do not hear these rumors I do not know what to say. So far as I am concerned, if I ever hear them I defend you as I know that _I_ am always defended by _you_ against _my_ detractors. And my defence follows two lines: there are some things which I always deny _in toto_, as, for instance, the statement in regard to that very vote; there are other acts of yours which I maintain were dictated by considerations of affection and kindness, as, for instance, your action with reference to the management of the games. But it does not escape you, with all your wisdom, that, if Cæsar was a king--which seems to me at any rate to have been the case--with respect of your duty two positions may be maintained, either the one which I am in the habit of taking, that your loyalty and friendship to Cæsar are to be praised, or the one which some people take, that the freedom of one's fatherland is to be esteemed more than the life of one's friend. I wish that my discussions springing out of these conversations had been repeated to you.

"Indeed, who mentions either more gladly or more frequently than I the two following facts, which are especially to your honor? The fact that you were the most influential opponent of the Civil War, and that you were the most earnest advocate of temperance in the moment of victory, and in this matter I have found no one to disagree with me. Wherefore I am grateful to our friend Trebatius for giving me an opportunity to write this letter, and if you are not convinced by it, you will think me destitute of all sense of duty and kindness; and nothing more serious to me than that or more foreign to your own nature can happen."

In all the correspondence of Cicero there is not a letter written with more force and delicacy of feeling, none better suited to accomplish its purpose than this letter to Matius. It is a work of art; but in that fact lies its defect, and in that respect it is in contrast to the answer which it called forth from Matius, The reply of Matius stands on a level with another better-known non-Ciceronian epistle, the famous letter of condolence which Servius wrote to Cicero after the death of Cicero's daughter, Tullia; but it is finer, for, while Servius is stilted and full of philosophical platitudes, Matius, like Shakespeare's Antony, "only speaks right on," in telling Cicero of his grief at Cæsar's death, of his indignation at the intolerant attitude of the assassins, and his determination to treasure the memory of Cæsar at any cost. This is his letter:

"_Matius to Cicero, greeting_[146]

"I derived great pleasure from your letter, because I saw that you held such an opinion about me as I had hoped you would hold, and wished you to hold; and although, in regard to that opinion, I had no misgivings, still, inasmuch as I considered it a matter of the greatest importance, I was anxious that it should continue unchanged. And then I was conscious of having done nothing to offend

any good citizen; therefore I was the less inclined to believe that you, endowed as you are with so many excellent qualities, could be influenced by any idle rumors, especially as my friendship toward you had been and was sincere and unbroken. Since I know that matters stand in this respect as I have wished them to stand, I will reply to the charges, which you have often refuted in my behalf in such a way as one would expect from that kindness of heart characteristic of you and from our friendship. It is true that what men said against me after the death of Cæsar was known to me. They call it a sin of mine that I sorrow over the death of a man dear to me, and because I grieve that he whom I loved is no more, for they say that 'fatherland should be above friendship,' just as if they had proved already that his death has been of service to the state. But I will make no subtle plea. I confess that I have not attained to your high philosophic planes; for, on the one hand, in the Civil War I did not follow a Cæsar, but a friend, and although I was grieved at the state of things, still I did not desert him; nor, on the other hand, did I at any time approve of the Civil War, nor even of the reason for strife, which I most earnestly sought to extinguish when it was kindling. Therefore, in the moment of victory for one bound to me by the closest ties, I was not captivated by the charm either of public office or of gold, while his other friends, although they had less influence with him than I, misused these rewards in no small degree. Nay, even my own property was impaired by a law of Cæsar's, thanks to which very law many who rejoice at the death of Cæsar have remained at Rome. I have worked as for my own welfare that conquered citizens might be spared.

"Then may not I, who have desired the welfare of all, be indignant that he, from whom this favor came, is dead? especially since the very men who were forgiven have brought him both unpopularity and death. You shall be punished, then, they say, 'since you dare to disapprove of our deed.' Unheard of arrogance, that some men glory in their crime, that others may not even sorrow over it without punishment! But it has always been the unquestioned right, even of slaves, to fear, to rejoice, to grieve according to the dictates of their own feelings rather than at the bidding of another man; of these rights, as things stand now, to judge from what these champions of freedom keep saying, they are trying to deprive us by intimidation; but their efforts are useless. I shall never be driven by the terrors of any danger from the path of duty or from the claims of friendship, for I have never thought that a man should shrink from an honorable death; nay, I have often thought that he should seek it. But why are they angry at me, if I wish them to repent of their deed? for I desire to have Cæsar's death a bitter thing to all men.

"'But I ought as a citizen to desire the welfare of the state.' Unless my life in the past and my hope for the future, without words from me, prove that I desire that very end, I do not seek to establish the fact by words. Wherefore I beg you the more earnestly to consider deeds more than words, and to believe, if you feel that it is well for the right to prevail, that I can have no intercourse with dishonorable men. For am I now, in my declining years, to change that course of action which I maintained in my youth, when I might even have gone astray with hope of indulgence, and am I to undo my life's work? I will not do so. Yet I shall take no step which may be displeasing to any man, except to grieve at the cruel fate of one most closely bound to me, of one who was a most illustrious man. But if I were otherwise minded, I would never deny what I was doing lest I should be regarded as shameless in doing wrong, a coward and a hypocrite in concealing it.

"'Yet the games which the young Cæsar gave in memory of Cæsar's victory I superintended.' But that has to do with my private obligation and not with the condition of the state; a duty, however, which I owed to the memory and the distinguished position of a dear friend even though he was dead, a duty which I could not decline when asked by a young man of most excellent promise and most worthy of Cæsar. 'I even went frequently to the house of the consul Antony to pay my respects!' to whom you will find that those who think that I am lacking in devotion to my country kept coming in throngs to ask some favor forsooth or secure some reward. But what arrogance this is that, while Cæsar never interfered with my cultivating the friendship of men whom I pleased, even when he himself did not like them, these men who have taken my friend from me should try to prevent me by their slander from loving those whom I will.

"But I am not afraid lest the moderation of my life may prove too weak to withstand false reports, or that even those who do not love me because of my loyalty to Cæsar may not prefer to have friends like me rather than like themselves. So far as I myself am concerned, if what I prefer shall be my lot, the life which is left me I shall spend in retirement at Rhodes; but if some untoward circumstance shall prevent it, I shall live at Rome in such a wise as to desire always that right be done. Our friend Trebatius I thank heartily in that he has disclosed your sincere and friendly feeling toward me, and has shown me that him whom I have always loved of my own free will I ought with the more reason to esteem and honor. Bene vale et me dilige."

With these words our knowledge of Matius comes almost to an end. His life was prolonged into the imperial period, and, strangely enough, in one of the few references to him which we find at a later date, he is characterized as "the friend of Augustus" (divi Augusti amicus). It would seem that the affection which he felt for Cæsar he transferred to Cæsar's heir and successor. He still holds no office or title. In this connection it is interesting to recall the fact that we owe the best of Cicero's philosophical work to him,

the "Academics," the "De Finibus," and the "Tusculan Questions," for Cicero tells us in his letter that he was induced to write his treatises on philosophy by Matius. It is a pleasant thing to think that to him we may also be indebted for Cicero's charming essay "On Friendship." The later life of Matius, then, we may think was spent in retirement, in the study of philosophy, and in the pursuit of literature. His literary pursuits give a homely and not unpleasant touch to his character. They were concerned with gastronomy, for Columella, in the first century of our era, tells us[147] that Matius composed three books, bearing the titles of "The Cook," "The Butler," and "The Picklemaker," and his name was transmitted to a later generation in a dish known as "mincemeat à la Matius" (_minutal Matianum_).[148] He passes out of the pages of history in the writings of Pliny the Elder as the man who "invented the practice of clipping shrubbery."[149] To him, then, we perhaps owe the geometrical figures, and the forms of birds and beasts which shrubs take in the modern English garden. His memory is thus ever kept green, whether in a way that redounds to his credit or not is left for the reader to decide.

Index

Acta Diurna. Anoyran monument. Anglo-Saxons, compared with Romans, in government; in private affairs. Arval Hymn, the. Ascoli's theory of the differentiation of the Romance languages. Augustus, "Res Gestæ"; his benefactions.

Batha, a municipal expense. Benefactions, private, co-operation with the government; _objects_; comparison of ancient and modern objects; of Æmilius; of Pompey; of Augustus; motives; expected of prominent men; attempts at regulation; a recognized responsibility; a legal obligation on municipal officials; offices thereby limited to the rich; of rich private citizens; effect on municipal life and character; on private citizens; charity. Burial societies.

Cælius, estimate of Curio. Cæsar, expenditures as sedile; and Curio; secures Curio as agent in Rome; unprepared for civil war; _et passim_ in chapters on Curio and Matius. Cato the elder, his diction. Charity. Church, the Christian, influence on the spread of Latin. Cicero, quotation from a letter in colloquial style; his "corrupt practices act,"; and Scaptius; and Curio; _correspondence_ with Matius. Civic pride of Romans. Civil war, outbreak of. Combinations in restraint of trade; government intervention. Common people, their language logical; progressive and conservative elements. Common people of Rome, their language (see _Latin, colloquial_); their religious beliefs; philosophy of life; belief in future life. Controversiae of the schools of rhetoric. Corporations; aid the government; collect taxes; in politics; many small stockholders. Cromer, Lord, "Ancient and Modern Imperialism,". Curio, funeral games in his father's honor; character; family; relations with Cicero; beginning of public life; relations with Cæsar; openly espouses Cæsar's cause; popularity; as quæstor; in the Clodian affair; Cælius's opinion of him; as tribune; relations with Pompey; forces conservatives to open hostilities; his part in the civil war; death.

Dacia, Latin in. Dialects in Italy, their disappearance. Diez, the Romance philologist. Diocletian's policy; his edict to regulate prices; content; discovery of document; amount extant; date; style; provisions of the edict; extracts; discussion; made prices uniform; its prices are retail; interesting deductions; effect; repeal.

English language in India. Epitaphs, deal with the common people; length of Roman epitaphs; along Appian Way; sentiments expressed; show religious beliefs; gods rarely named; Mother Earth. Epitaphs, metrical, praises of women predominate; literary merit; art. Étienne, Henri, first scholar to notice colloquial Latin.

Food, cost of, comparison with to-day; free distribution of.

Gracchi, the. Greek language, in Italy; not conquered by Latin; influence on Latin. Gröber's theory of the differentiation of the Romance languages; criticism of. Guilds; were non-political; inscriptional evidence; comparison of conditions in East and West; objects; dinners; temples; rules; no attempts to raise wages; religious character; began to enter politics; attitude of government toward; decline.

Hempl's theory of language rivalry. Horace, his "curiosa felicitas,".

Inscription from Pompeii, in colloquial Latin.

Julia, death of. Julian's edict to regulate the price of grain.

Labor-unions. (See _Guilds_.) Lactantius, "On the Deaths of Those Who Persecuted (the Christians),". Languages spoken in Italy in the early period; influence of other languages on Latin, 22. (See also _Greek_.) Latin language, extent; unifying influences; uniformity; evidence of inscriptions; causes of its spread; colonies; roads; merchants; soldiers; government officials; the church; its

superiority not a factor; sentiment a cause; "peaceful invasion,". Latin, colloquial, its study neglected till recently; first noticed in modern times by Henri Étienne; its forms, how determined; ancient authority for its existence; evidence of the Romance languages; aid derived from a knowledge of spoken English; analytical formation of tenses; slang; extant specimens; causes of variation; external influences on; influence of culture; definition of colloquial Latin; relation to literary Latin; careless pronunciation; accent different from literary Latin; confusion of genders; monotonous style; tendencies in vocabulary, 64-7: in syntax; effect of loss of final letters; reunion with literary Latin; still exists in the Romance languages; date when it became the separate Romance language; specimens quoted. Latin, literary, modelled on Greek; relation to colloquial Latin; standardized by grammarians; style unnatural; reunion with colloquial Latin; disappearance. Latin, preliterary. Laws of the Twelve Tables; excerpt from. Living, cost of, comparison with to-day. Livius Andronicus. Lucan's account of the death of Curio.

Matius, Gaius, early life and character; with Cæsar in Gaul; friendship with Cæsar, _passim_; accepted no office; devotion to Cæsar; unpopularity due to it; correspondence with Cicero; defence of his devotion to Cæsar; prompted Cicero's best philosophical works; later life; literary works. Menippean satire. Milesian tales. Money, unit of.

Nævius. Ninus romance; and Petronius.

Organization, of capitalists (see _Corporations_); of labor (see _Guilds_). Oscan.

Paternalism, beginnings of, in Rome; effect on people. Patron, office of; benefactions of. Pervigilium Veneris. Petronius, Satiræ; excerpt from; original size; motif; Trimalchio's Dinner; satirical spirit; literary criticism; Horatian humor; cynical attitude; realism; prose-poetic form; origin of this genre of literature; the Satiræ and the epic; and the heroic romance; and the Menippean satire; and the Milesian tale; and the prologue of comedy; and the mime; the Satiræ perhaps a mixture of many types; originated with Petronius. Plautus. Poetry of the common people, dedicatory; ephemeral; graffiti; borrowed from the Augustan poets; folk poetry; children's jingles. Pompey, his benefactions; ordered to march against Cæsar; _et passim_ in chapter on Curio. Prices, controlled by corporations; attempts at government regulation. Probus, the "Appendix" of. Prose-poetic form.

Ritschl, the Plautine scholar. Romance, the realistic, origin obscure. (See _Petronius, Satiræ_.) Romance languages, causes of their differentiation, Gröber's theory; Ascoli's theory; date of their beginning; descended from colloquial Latin; reasons of their agreement; common source. Romances, the Greek, theory of origin.

Salaries of municipal officers. (See also _Wages_.) Scaptius and Cicero. Seneca the elder, "Controversiæ,". Strasburg oath. Strikes.

Theatres a municipal expense. Trimalchio's Dinner.

Umbrian. Urso, constitution of.

Wages in Roman times; compared with to-day; and guilds; and slavery. (See also _Salaries_.)

Footnotes

[2] The relation between Latin and the Italic dialects may be illustrated by an extract or two from them with a Latin translation. An Umbrian specimen may be taken from one of the bronze tablets found at Iguvium, which reads in Umbrian: Di Grabouie, saluo seritu ocrem Fisim, saluam seritu totam Iiouinam (_Iguvinian Tables_ VI, a. 51), and in Latin: Deus Grabovi, salvam servato arcem Fisiam, salvam servato civitatem Iguvinam. A bit of Oscan from the Tabula Bantina (Tab. Bant. 2, 11) reads: suaepis contrud exeic fefacust auti comono hipust, molto etanto estud, and in Latin: siquis contra hoc fecerit aut comitia habuerit, multa tanta esto.

[86] _Cf._ Rosenbluth, _Beiträge zur Quellenkunde von Petrons Satiren_. Berlin, 1909.

[87] This theory in the main is suggested by Rohde, _Der griechische Roman_, 2d ed., 267 (Leipzig, 1900), and by Ribbeck, _Geschichte d. röm. Dichtung_, 2d ed., III, 150.

[88] _Corpus Inscriptionum Latinarum_, vol. III, pp. 1926-1953. Mommsen's text with a commentary has been published by H. Blümner, in _Der Maximaltarif des Diocletian_, Berlin, 1893. A brief description of the edict may be found in the Pauly-Wissowa _Real-Encyclopadie der classischen Altertumswissenschaft_, under "Edictum Diocletiani," and K. Bücher has discussed some points in it in the _Zeitschrift für die gesamte Staatswissenschaft_, vol. L (1894), pp. 189-219 and 672-717.

[89] The method of arrangement may be illustrated by an extract from the first table, which deals with grain and vegetables.

[90] The present-day prices which are given in the third column of these two tables are taken from Bulletin No. 77 of the Bureau of Labor, and from the majority and minority reports of the Select Committee of the U.S. Senate on "Wages and Prices of Commodities" (Report, No. 912, Documents, Nos. 421 and 477). In setting down a number to represent the current price of an article naturally a rough average had to be struck of the rates charged in different parts of the country. Bulletin No. 77, for instance, gives the retail price charged for butter at 226 places in 68 different cities, situated in 39 different States. At one point in Illinois the price quoted in 1906 was 22 cents, while at a point in Pennsylvania 36 cents was reported, but the prevailing price throughout the country ranged from 26 to 32, so that these figures were set down in the table. A similar method has been adopted for the other items. A special difficulty arises in the case of beef, where the price varies according to the cut. The price of wheat is not given in

the extant fragment of the edict, but has been calculated by Blümner from statements in ancient writers. So far as the wages of the ancient and modern workman are concerned we must remember that the Roman laborer in many cases received "keep" from his employer. Probably from one-third to three-sevenths should be added to his daily wage to cover this item. Statistics published by the Department of Agriculture show that the average wage of American farm laborers per month during 1910 was $27.50 without board and $19.21 with board. The item of board, therefore, is three-sevenths of the money paid to the laborer when he keeps himself. One other point of difference between ancient and modern working conditions must be borne in mind in attempting a comparison. We have no means of knowing the length of the Roman working day. However, it was probably much longer than our modern working day, which, for convenience' sake, is estimated at eight hours.

[91] Wholesale price in 1909.

[92] Receives "keep" also.

[93] Eight-hour day assumed.

[94] _Cf._ Report of the Commissioner of Labor, pp. 622-625. In England between one-third and one-fourth; _cf._ Bulletin, No. 77, p. 345.

PREFACE

THE frequent references made in the present work, on my own authority, to customs and ideas prevalent among the natives of Morocco, require a word of explanation. Seeing the close connection between moral opinions and magic and religious beliefs, I thought it might be useful for me to acquire first-hand knowledge of the folk-lore of some non-European people, and for various reasons I chose Morocco as my field of research. During the four years I spent there, largely among its country population, I have not only collected anthropological data, but tried to make myself familiar with the native way of thinking; and I venture to believe that this has helped me to understand various customs occurring at a stage of civilisation different from our own. I purpose before long to publish the detailed results of my studies in a special monograph on the popular religion and magics of the Moors.

For these researches I have derived much material support from the University of Helsingfors. I am also indebted to the Russian Minister at Tangier, M. B. de Bacheracht, for his kindness in helping me on several occasions when I was dependent on the Sultan's Government. All the time I have had the valuable assistance of my Moorish friend Shereef [(]Abd-es-Salâm el-Ba[k.][k.]âli, to whom credit {vi} is due for the kind reception I invariably received from peasants and mountaineers, not generally noted for friendliness towards Europeans.

I beg to express my best thanks to Mr. Stephen Gwynn for revising the first thirteen chapters, and to Mr. H. C. Minchin for revising the remaining portion of the book. To their suggestions I am indebted for the improvement of many phrases and expressions. I have likewise to thank my friend Mr. Alex. F. Shand for kindly reading the proofs of the earlier chapters and giving me the benefit of his opinion.

Throughout the work the reader will easily find how much I owe to British science and thought--a debt which is greater than I can ever express.

London,

July, 1912.

CONTENTS

INTRODUCTORY

The origin of the present investigation, p. 1.--Its subject-matter, p. 1 _sq._--Its practical usefulness, p. 2 _sq._

CHAPTER I

THE EMOTIONAL ORIGIN OF MORAL JUDGMENTS

The moral concepts essentially generalisations of tendencies in certain phenomena to call forth moral emotions, pp. 4-6.--The assumed universality or "objectivity" of moral judgments, p. 6 _sq._--Theories according to which the moral predicates derive all their import from reason, "theoretical" or "practical," p. 7 _sq._--Our tendency to objectivise moral judgments, no sufficient ground for referring them to the province of reason, p. 8 _sq._--This tendency partly due to the comparatively uniform nature of the moral consciousness, p. 9.--Differences of moral estimates resulting from circumstances of a purely intellectual character, pp. 9-11.--Differences of an emotional origin, pp. 11-13.--Quantitative, as well as qualitative, differences, p. 13.--The tendency to objectivise moral judgments partly due to the authority ascribed to moral rules, p. 14.--The origin and nature of this authority, pp. 14-17.--General moral truths non-existent, p. 17 _sq._--The object of scientific ethics not to fix rules for human conduct, but to study

the moral consciousness as a fact, p. 18.--The supposed dangers of ethical subjectivism, pp. 18-20.

CHAPTER II

THE NATURE OF THE MORAL EMOTIONS

The moral emotions of two kinds: disapproval, or indignation, and approval, p. 21.--The moral emotions retributive emotions, disapproval forming a sub-species of resentment, and approval a sub-species of retributive kindly emotion, _ibid._--Resentment an aggressive attitude of mind toward a cause of pain, p. 22 _sq._--Dr. Steinmetz's suggestion that revenge is essentially rooted in the feeling of power and superiority, and originally "undirected," pp. 23-27.--The true import of the facts adduced as evidence for this hypothesis, pp. 27-30.--The collective responsibility usually involved in the institution of the blood-feud, pp. 30-32.--Explanation of it, pp. 32-35.-- {viii} The strong tendency to discrimination which characterises resentment not wholly lost even behind the veil of common responsibility, p. 35 _sq._--Revenge among the lower animals, p. 37 _sq._--Violation of the "self-feeling" a common incentive to resentment, p. 38 _sq._--But the reaction of the wounded "self-feeling" not necessarily, in the first place, concerned with the infliction of pain, p. 39 _sq._--Revenge only a link in a chain of emotional phenomena for which "non-moral resentment" may be used as a common name, p. 40.--The origin of these phenomena, pp. 40-42.--Moral indignation closely connected with anger, p. 42 _sq._--Moral indignation, like non-moral resentment, a reactionary attitude of mind directed towards the cause of inflicted pain, though the reaction sometimes turns against innocent persons, pp. 43-48.--In their administration of justice gods still more indiscriminate than men, pp. 48-51.--Reasons for this, p. 51 _sq._--Sin looked upon in the light of a contagious matter, charged with injurious energy, pp. 52-57.--The curse looked upon as a baneful substance injuring or destroying anybody to whom it cleaves, p. 57 _sq._--The tendency of curses to spread, pp. 58-60.--Their tendency to contaminate those who derive their origin from the infected individual, p. 60 _sq._--The vicarious suffering involved in sin-transference not to be confounded with vicarious expiatory sacrifice, p. 61.--Why scapegoats are sometimes killed, pp. 61-64.--Why sacrificial victims are sometimes used as scapegoats, p. 64 _sq._--Vicarious expiatory sacrifices, pp. 65-67.--The victim accepted as a substitute on the principle of social solidarity, p. 67 _sq._--Expiatory sacrifices offered as ransoms, p. 68 _sq._--Protests of the moral consciousness against the infliction of penal suffering upon the guiltless, pp. 70-72.

CHAPTER III

THE NATURE OF THE MORAL EMOTIONS (_continued_)

Whilst, in the course of mental evolution, the true direction of the hostile reaction involved in moral disapproval has become more apparent, its aggressive character has become more disguised, p. 73.--Kindness to enemies not a rule in early ethics, p. 73 _sq._--At the higher stages of moral development retaliation condemned and forgiveness of enemies laid down as a duty, pp. 74-77.--The rule of retaliation and the rule of forgiveness not radically opposed to each other, p. 77 _sq._--Why enlightened and sympathetic minds disapprove of resentment and retaliation springing from personal motives, p. 78 _sq._--The aggressive character of moral disapproval has also become more disguised by the different way in which the aggressiveness displays itself, p. 79.--Retributive punishment condemned, and the end of punishment considered to be either to deter from crime, or to reform the criminal, or to repress crime by eliminating or secluding him, pp. 79-81.--Objections to these theories, p. 82 _sq._--Facts which, to some extent, fill up the gap between the theory of retribution and the utilitarian theories of punishment, pp. 84-91.--The aggressive element in moral disapproval has undergone a change which tends to conceal its true nature by narrowing the channel in which it discharges itself, deliberate and discriminating resentment being apt to turn against the will rather than against the willer, p. 91 _sq._--Yet it is the instinctive desire to inflict counter-pain that gives to moral indignation its most important characteristic, p. 92 _sq._--Retributive kindly emotion a friendly attitude of mind towards a cause of pleasure, p. 93 _sq._--Retributive kindly emotion among the lower animals, p. 94.--Its intrinsic object, p. 94 _sq._--The want of discrimination which is sometimes found in retributive kindness, p. 95.--Moral approval a kind of retributive kindly emotion, _ibid._--Moral approval sometimes bestows its favours upon undeserving individuals for the merits of others, pp. 95-97.--Explanation of this, p. 97 _sq._--Protests against the notion of vicarious merit, p. 98 _sq._

{ix} CHAPTER IV

THE NATURE OF THE MORAL EMOTIONS (_concluded_)

Refutation of the opinion that moral emotions only arise in consequence of moral judgments, p. 100 _sq._--However, moral judgments, being definite expressions of moral emotions, help us to discover the true nature of these emotions, p.

101.--Disinterestedness and apparent impartiality characteristics by which moral indignation and approval are distinguished from other, non-moral, kinds of resentment or retributive kindly emotion, pp. 101-104.--Besides, a moral emotion has a certain flavour of generality, p. 104 _sq._--The analysis of the moral emotions which has been attempted in this and the two preceding chapters holds true not only of such emotions as we feel on account of the conduct of others, but of such emotions as we feel on account of our own conduct as well, pp. 105-107.

CHAPTER V

THE ORIGIN OF THE MORAL EMOTIONS

We may feel disinterested resentment, or disinterested retributive kindly emotion, on account of an injury inflicted, or a benefit conferred, upon another person with whose pain, or pleasure, we sympathise, and in whose welfare we take a kindly interest, p. 108.--Sympathetic feelings based on association, p. 109 _sq._--Only when aided by the altruistic sentiment sympathy induces us to take a kindly interest in the feelings of our neighbours, and tends to produce disinterested retributive emotions, p. 110 _sq._--Sympathetic resentment to be found in all animal species which possess altruistic sentiments, p. 111 _sq._--Sympathetic resentment among savages, p. 113 _sq._--Sympathetic resentment may not only be a reaction against sympathetic pain, but may be directly produced by the cognition of the signs of anger (punishment, language, &c.), pp. 114-116.--Disinterested antipathies, p. 116 _sq._--Sympathy springing from an altruistic sentiment may also produce disinterested kindly emotion, p. 117.--Disinterested likings, _ibid._--Why disinterestedness, apparent impartiality, and the flavour of generality have become characteristics by which so-called moral emotions are distinguished from other retributive emotions, p. 117 _sq._--Custom not only a public habit, but a rule of conduct, p. 118.--Custom conceived of as a moral rule, p. 118 _sq._--In early society customs the only moral rules ever thought of, p. 119.--The characteristics of moral indignation to be sought for in its connection with custom, p. 120.--Custom characterised by generality, disinterestedness, and apparent impartiality, p. 120 _sq._--Public indignation lies at the bottom of custom as a moral rule, p. 121 _sq._--As public indignation is the prototype of moral disapproval, so public approval is the prototype of moral approval, p. 122.--Moral disapproval and approval have not always remained inseparably connected with the feelings of any special society, p. 122 _sq._--Yet they remain to the last public emotions if not in reality, then as an ideal, p. 123.--Refutation of the opinion that the original form of the moral consciousness has been the individual's own conscience, p. 123 _sq._--The antiquity of moral resentment, p. 124.--The supposition that remorse is unknown among the lower races contradicted by facts, p. 124 _sq._--Criticism of Lord Avebury's statement that modern savages seem to be almost entirely wanting in moral feeling, pp. 125-129.--The antiquity of moral approval, p. 129 _sq._

{x} CHAPTER VI

ANALYSIS OF THE PRINCIPAL MORAL CONCEPTS

Our analysis to be concerned with moral concepts formed by the civilised mind, p. 131.--Moral concepts among the lower races, pp. 131-133.--Language a rough generaliser, p. 133.--Analysis of the concepts _bad_, _vice_, and _wrong_, p. 134.--Of _ought_ and _duty_, pp. 134-137.--Of _right_, as an adjective, pp. 137-139.--Of _right_, as a substantive, p. 139 _sq._--Of the relations between _rights_ and _duties_, p. 140 _sq._--Of _injustice_ and _justice_, pp. 141-145.--Of _good_, pp. 145-147.--Of _virtue_, pp. 147-149.--Of the relation between _virtue_ and _duty_, p. 149 _sq._--Of _merit_, p. 150 _sq._--Of the relation between _merit_ and _duty_, p. 151 _sq._--The question of the _super-obligatory_, pp. 152-154.--The question of the morally _indifferent_, pp. 154-157.

CHAPTER VII

CUSTOMS AND LAWS AS EXPRESSIONS OF MORAL IDEAS

How we can get an insight into the moral ideas of mankind at large, p. 158.--The close connection between the habitualness and the obligatoriness of custom, p. 159.--Though every public habit is not a custom, involving an obligation, men's standard of morality is not independent of their practice, p. 159 _sq._--The study of moral ideas to a large extent a study of customs, p. 160.--But custom never covers the whole field of morality, and the uncovered space grows larger in proportion as the moral consciousness develops, p. 160 _sq._--At the lower stages of civilisation custom the sole rule for conduct, p. 161.--Even kings described as autocrats tied by custom, p. 162.--In competition with law custom frequently carries the day, p. 163 _sq._--Custom stronger than law and religion combined, p. 164.--The laws themselves command obedience more as customs than as laws, _ibid._--Many laws were customs before they became laws, p. 165.--The transformation of customs into laws, p. 165 _sq._--Laws as expressions of moral ideas, pp. 166-168.--Punishment and indemnification, p. 168 _sq._--Definition of punishment, p. 169 _sq._--Savage

punishments inflicted upon the culprit by the community at large, pp. 170-173.--By some person or persons invested with judicial authority, pp. 173-175.--The development of judicial organisation out of a previous system of lynch-law, p. 175.--Out of a previous system of private revenge, p. 176.--Public indignation displays itself not only in punishment, but to a certain extent in the custom of revenge, p. 176 _sq._--The social origin of the _lex talionis_, pp. 177-180.--The transition from revenge to punishment, and the establishment of a central judicial and executive authority, pp. 180-183.--The jurisdiction of chiefs, p. 183 _sq._--The injured party or the accuser acting as executioner, but not as judge, p. 184_sq._--The existence of punishment and judicial organisation among a certain people no exact index to its general state of culture, p. 185.--The supposition that punishment has been intended to act as a deterrent, p. 185 _sq._--Among various semi-civilised and civilised peoples the criminal law has assumed a severity which far surpasses the rigour of the _lex talionis_, pp. 186-183.--Wanton cruelty not a general characteristic of the public justice of savages, pp. 188-190. Legislators referring to the deterrent effects of punishment, p. 190 _sq._--The practice of punishing criminals in public, p. 191 _sq._--The punishment actually inflicted on the criminal in many cases much less severe than the punishment with which the law threatens him, p. 192 _sq._--The detection of criminals was in earlier times much rarer and more uncertain than it is now, p. 193.--The chief explanation of the great severity of certain {xi} criminal codes lies in their connection with despotism or religion or both, pp. 193-198.--Punishment may also be applied as a means of deterring from crime, p. 198 _sq._--But the scope which justice leaves for determent pure and simple is not wide, p. 199.--The criminal law of a community on the whole a faithful exponent of moral sentiments prevalent in that community at large, pp. 199-201.

CHAPTER VIII

THE GENERAL NATURE OF THE SUBJECTS OF ENLIGHTENED MORAL JUDGMENTS

Definitions of the term "conduct," p. 202 _sq._--The meaning of the word "act," p. 203 _sq._--The meaning of the word "intention," p. 204.--There can be only one intention in one act, p. 204 _sq._ The moral judgments which we pass on acts do not really relate to the event, but to the intention, p. 205 _sq._--A person morally accountable also for his deliberate wishes, p. 206.--A deliberate wish is a volition, p. 206 _sq._--The meaning of the word "motive," p. 207.--Motives which are volitions fall within the sphere of moral valuation, _ibid._--The motive of an act may be an intention, but an intention belonging to another act, _ibid._--Even motives which consist of non-volitional conations may indirectly exercise much influence on moral judgments, p. 207 _sq._--Refutation of Mill's statement that "the motive has nothing to do with the morality of the action," p. 208 _sq._--Moral judgments really passed upon men as acting or willing, not upon acts or volitions in the abstract, p. 209. --Forbearances morally equivalent to acts, p. 209 _sq._--Distinction between forbearances and omissions, p. 210.--Moral judgments refer not only to willing, but to not-willing as well, not only to acts and forbearances, but to omissions, p. 210 _sq._--Negligence, heedlessness, and rashness, p. 211.--Moral judgments of blame concerned with not-willing only in so far as this not-willing is attributed to a defect of the "will," p. 211 _sq._--Distinction between conscious omissions and forbearances, and between not-willing to refrain from doing and willing to do, p. 212.--The "known concomitants of acts," p. 213.--Absence of volitions also gives rise to moral praise, p. 213 _sq._--The meaning of the term "conduct," p. 214.--The subject of a moral judgment is, strictly speaking, a person's will, or character, conceived as the cause either of volitions or of the absence of volitions, p. 214 _sq._--Moral judgments that are passed on emotions or opinions really refer to the will, p. 215 _sq._

CHAPTER IX

THE WILL AS THE SUBJECT OF MORAL JUDGMENT AND THE INFLUENCE OF EXTERNAL EVENTS

Cases in which no distinction is made between intentional and accidental injuries, pp. 217-219.--Yet even in the system of self-redress intentional or foreseen injuries often distinguished from unintentional and unforeseen injuries, pp. 219-221.--A similar distinction made in the punishments inflicted by many savages, p. 221 _sq._--Uncivilised peoples who entirely excuse, or do not punish, persons for injuries which they have inflicted by mere accident, p. 222 _sq._--Peoples of a higher culture who punish persons for bringing about events without any fault of theirs, pp. 223-226.--At the earlier stages of civilisation gods, in particular, attach undue importance to the outward aspect of conduct, pp. 226-231.--Explanation of all these facts, pp. 231-237.--The great influence which the outward event exercises upon moral estimates even among ourselves, pp. 238-240. --Carelessness generally not punished if no injurious result follows, p. 241.--An unsuccessful attempt to commit a criminal act, if punished at all, as a rule punished much less {xii} severely than the accomplished act, p. 241 _sq._--Exceptions to this rule, p. 242.--The question, which attempts should be punished, p. 243.--The stage at which an attempt begins to be criminal, and the distinction between attempts and acts of preparation, p. 243 _sq._--The rule that an outward event is requisite for the infliction of punishment, p. 244 _sq._--Exceptions to this rule, p. 245.--Explanation of laws referring to unsuccessful attempts, pp. 245-247.--Moral approval

influenced by external events, p. 247.--Owing to its very nature, the moral consciousness, when sufficiently influenced by thought, regards the will as the only proper object of moral disapproval or praise, p. 247 _sq._

CHAPTER X

AGENTS UNDER INTELLECTUAL DISABILITY

An agent not responsible for anything which he could not be aware of, p. 249.--The irresponsibility of animals, pp. 249-251.--Resentment towards an animal which has caused some injury, p. 251.--At the lower stages of civilisation animals deliberately treated as responsible beings, _ibid._--The custom of blood-revenge extended to the animal world, pp. 251-253.--Animals exposed to regular punishment, pp. 253-255. --The origin of the mediæval practice of punishing animals, p. 255 _sq._ --Explanation of the practice of retaliating upon animals, pp. 256-260. --At the earlier stages of civilisation even inanimate things treated as if they were responsible agents, pp. 260-262.--Explanation of this, pp. 262-264.--The total or partial irresponsibility of childhood and early youth, pp. 264-267.--According to early custom, children sometimes subject to the rule of retaliation, p. 267. --Parents responsible for the deeds of their children, p. 267 _sq._--In Europe there has been a tendency to raise the age at which full legal responsibility commences, p. 268 _sq._--The irresponsibility of idiots and madmen, p. 269 _sq._--Idiots and insane persons objects of religious reverence, p. 270 _sq._--Lunatics treated with great severity or punished for their deeds, pp. 271-274.--Explanation of this, p. 274 _sq._--The ignorance of which lunatics have been victims in the hands of lawyers, pp. 275-277.--The total or partial irresponsibility of intoxicated persons, p. 277 _sq._--Drunkenness recognised as a ground of extenuation, pp. 278-280.--Not recognised as a ground of extenuation, p. 280 _sq._--Explanation of these facts, p. 281 _sq._

CHAPTER XI

MOTIVES

Motives considered only in proportion as the moral judgment is influenced by reflection, p. 283.--Little consideration for the sense of duty as a motive, _ibid._--Somewhat greater discrimination shown in regard to motives consisting of powerful non-volitional conations, p. 283 _sq._--Compulsion as a ground of extenuation, p. 284 _sq._--"Compulsion by necessity," pp. 285-287.--Self-defence, pp. 288-290.--Self-redress in the case of adultery, and other survivals of the old system of self-redress, pp. 290-294.--The moral distinction made between an injury which a person inflicts deliberately, in cold blood, and one which he inflicts in the heat of the moment, on provocation, pp. 294-297.--Explanation of this distinction, p. 297 _sq._--The pressure of a non-volitional motive on the will as a ground of extenuation, p. 298 _sq._--That moral judgments are generally passed, in the first instance, with reference to acts immediately intended, and consider motives only in proportion as the judgment is influenced by reflection, holds good not only of moral blame, but of moral praise, pp. 299-302.

{xiii} CHAPTER XII

FORBEARANCES AND CARELESSNESS--CHARACTER

Why in early moral codes the so-called negative commandments are much more prominent than the positive commandments, p. 303.--The little cognisance which the criminal laws of civilised nations take of forbearances and omissions, p. 303 _sq._--The more scrutinising the moral consciousness, the greater the importance which it attaches to positive commandments, p. 304 _sq._--Yet the customs of all nations contain not only prohibitions, but positive injunctions as well, p. 305.--The unreflecting mind apt to exaggerate the guilt of a person who out of heedlessness or rashness causes harm by a positive act, _ibid._--Early custom and law may be anxious enough to trace an event to its source, pp. 305-307.--But they easily fail to discover where there is guilt or not, and, in case of carelessness, to determine the magnitude of the offender's guilt, p. 307 _sq._--The opinion that a person is answerable for all the damage which directly ensues from an act of his, even though no foresight could have reasonably been expected to look out for it, p. 308 _sq._--On the other hand, little or no censure passed on him whose want of foresight or want of self-restraint is productive of suffering, if only the effect is sufficiently remote, p. 309 _sq._--The moral emotions may as naturally give rise to judgments on human character as to judgments on human conduct, p. 310.--Even when a moral judgment immediately refers to a distinct act, it takes notice of the agent's will as a whole, p. 310 _sq._--The practice of punishing a second or third offence more severely than the first, p. 311 _sq._--The more a moral judgment is influenced by reflection, the more it scrutinises the character which manifests itself in that individual piece of conduct by which the judgment is occasioned, p. 312 _sq._--But however superficial it be, it always refers to a will conceived of as a continuous entity, p. 313.

CHAPTER XIII

WHY MORAL JUDGMENTS ARE PASSED ON CONDUCT AND CHARACTER--MORAL VALUATION AND FREE-WILL

Explanation of the fact that moral judgments are passed on conduct and character, p. 314.--The correctness of this explanation proved by the circumstance that not only moral emotions, but non-moral retributive emotions as well, are felt with reference to phenomena exactly similar in nature to those on which moral judgments are passed, pp. 314-319.--Whether moral or non-moral, a retributive emotion is essentially directed towards a sensitive and volitional entity, or self, conceived of as the cause of pleasure or the cause of pain, p. 319.--The futility of other attempts to solve the problem, p. 319 _sq._--The nature of the moral emotions also gives us the key to the problem of the co-existence of moral responsibility with the general law of cause and effect, p. 320.--The theory according to which responsibility, in the ordinary sense of the term, and moral judgments generally, are inconsistent with the notion that the human will is determined by causes, p. 320 _sq._--Yet, as a matter of fact, moral indignation and moral approval are felt by determinists and libertarians alike, p. 321 _sq._--Explanation of the fallacy which lies at the bottom of the conception that moral valuation is inconsistent with determinism, p. 322.--Causation confounded with compulsion, pp. 322-324.--The difference between fatalism and determinism, pp. 324-326.--The moral emotions not concerned with the origin of the innate character, p. 326.

{xiv} CHAPTER XIV

PRELIMINARY REMARKS--HOMICIDE IN GENERAL

Necessity of restricting the investigation to the more important modes of conduct with which the moral consciousness is concerned, p. 327 _sq._--The six groups into which these modes of conduct may be divided, p. 328.--The most sacred duty which we owe to our fellow-creatures generally considered to be regard for their lives, _ibid._--Among various uncivilised peoples human life said to be held very cheap, p. 328 _sq._--Among others homicide or murder said to be hardly known, p. 329 _sq._--In other instances homicide expressly said to be regarded as wrong, p. 330 _sq._--In every society custom prohibits homicide within a certain circle of men, p. 331.--Savages distinguish between an act of homicide committed within their own community and one where the victim is a stranger, pp. 331-333.--In various instances, however, the rule, "Thou shalt not kill," applies even to foreigners, p. 333 _sq._--Some uncivilised peoples said to have no wars, p. 334.--Savages' recognition of intertribal rights in times of peace obvious from certain customs connected with their wars, p. 334 _sq._--Savage custom does not always allow indiscriminate slaughter even in warfare, p. 335 _sq._--The readiness with which savages engage in war, p. 337.--The old distinction between injuries committed against compatriots and harm done to foreigners remains among peoples more advanced in culture, p. 337 _sq._--The readiness with which such peoples wage war on foreign nations, and the estimation in which the successful warrior is held, pp. 338-340.--The life of a guest sacred, p. 340.--The commencement of international hostilities preceded by special ceremonies, _ibid._--Warfare in some cases condemned, or a distinction made between just and unjust war, pp. 340-342.--Even in war the killing of an enemy under certain circumstances prohibited, either by custom or by enlightened moral opinion, pp. 342-344.

CHAPTER XV

HOMICIDE IN GENERAL (_continued_)

Homicide of any kind condemned by the early Christians, p. 345.--Their total condemnation of warfare, p. 345 _sq._--This attitude towards war was soon given up, pp. 346-348.--The feeling that a soldier scarcely could make a good Christian, p. 348.--Penance prescribed for those who had shed blood in war, p. 348 _sq._--Wars forbidden by popes, p. 349. --The military Christianity of the Crusades, pp. 348-352.--Chivalry, pp. 352-354.--The intimate connection between chivalry and religion displayed in tournaments, p. 354 _sq._--The practice of private war, p. 355 _sq._--The attitude of the Church towards private war, p. 356.--The Truce of God, p. 357.--The main cause of the abolition of private war was the increase of the authority of emperors or kings, p. 357 _sq._--War looked upon as a judgment of God, p. 358.--The attitude adopted by the great Christian congregations towards war one of sympathetic approval, pp. 359-362.--Religious protests against war, pp. 362-365.--Freethinkers' opposition to war, pp. 365-367.--The idea of a perpetual peace, p. 367.--The awakening spirit of nationalism, and the glorification of war, p. 367 _sq._--Arguments against arbitration, p. 368.--The opposition against war rapidly increasing, p. 368 _sq._--The prohibition of needless destruction in war, p. 369 _sq._--The survival, in modern civilisation, of the old feeling that the life of a foreigner is not equally sacred with that of a countryman, p. 370.--The behaviour of European colonists towards coloured races, p. 370 _sq._

{xv} CHAPTER XVI

HOMICIDE IN GENERAL (_concluded_)

Sympathetic resentment felt on account of the injury suffered by the victim a potent cause of the condemnation of homicide, p. 372 _sq._--No such resentment felt if the victim is a member of another group, p. 373.--Why extra-tribal homicide is approved of, _ibid._--Superstition an encouragement to extra-tribal homicide, _ibid._--The expansion of the altruistic sentiment largely explains why the prohibition of homicide has come to embrace more and more comprehensive circles of men, _ibid._--Homicide viewed as an injury inflicted upon the survivors, p. 373 _sq._--Conceived as a breach of the "King's peace," p. 374.--Stigmatised as a disturbance of public tranquillity and an outrage on public safety, _ibid._--Homicide disapproved of because the manslayer gives trouble to his own people, p. 374 _sq._--The idea that a manslayer is unclean, pp. 375-377.--The influence which this idea has exercised on the moral judgment of homicide, p. 377.--The disapproval of the deed easily enhanced by the spiritual danger attending on it, as also by the inconvenient restrictions laid on the tabooed manslayer and the ceremonies of purification to which he is subject, p. 377 _sq._--The notion of a persecuting ghost may be replaced by the notion of an avenging god, pp. 378-380.--The defilement resulting from homicide particularly shunned by gods, p. 380 _sq._--Priests forbidden to shed human blood, p. 381 _sq._--Reasons for Christianity's high regard for human life, p. 382.

CHAPTER XVII

THE KILLING OF PARENTS, SICK PERSONS, CHILDREN-FETICIDE

Parricide the most aggravated form of murder, pp. 383-386.--The custom of abandoning or killing parents who are worn out with age or disease, p. 386 _sq._--Its causes, pp. 387-390.--The custom of abandoning or killing persons suffering from some illness, p. 391 _sq._--Its causes, p. 392 _sq._--The father's power of life and death over his children, p. 393 _sq._--Infanticide among many savage races permitted or even enjoined by custom, pp. 394-398.--The causes of infanticide, and how it has grown into a regular custom, pp. 398-402.--Among many savages infanticide said to be unheard of or almost so, p. 402 _sq._--The custom of infanticide not a survival of earliest savagery, but seems to have grown up under specific conditions in later stages of development, p. 403.--Savages who disapprove of infanticide, p. 403 _sq._--The custom of infanticide in most cases requires that the child should be killed immediately or soon after its birth, p. 404 _sq._--Infanticide among semi-civilised or civilised races, pp. 405-411.--The practice of exposing new-born infants vehemently denounced by the early Fathers of the Church, p. 411.--Christian horror of infanticide, p. 411 _sq._--The punishment of infanticide in Christian countries, p. 412 _sq._--Feticide among savages, p. 413 _sq._--Among more civilised nations, p. 414 _sq._--According to Christian views, a form of murder, p. 415 _sq._--Distinctions between an _embryo informatus_ and an _embryo formatus_, p. 416 _sq._--Modern legislation and opinion concerning feticide, p. 417.

CHAPTER XVIII

THE KILLING OF WOMEN, AND OF SLAVES--THE CRIMINALITY OF HOMICIDE INFLUENCED BY DISTINCTIONS OF CLASS

The husband's power of life and death over his wife among many of the lower races, p. 418 _sq._--The right of punishing his wife capitally not universally {xvi} granted to the husband in uncivilised communities, p. 419.--The husband's power of life and death among peoples of a higher type, _ibid._--Uxoricide punished less severely than matricide, p. 419 _sq._--The estimate of a woman's life sometimes lower than that of a man's, sometimes equal to it, sometimes higher, p. 420 _sq._--The master's power of life and death over his slave, p. 421 _sq._--The right, among many savages, of killing his slave at his own discretion expressly denied to the master, p. 422 _sq._--The murder of another person's slave largely regarded as an offence against the property of the owner, but not exclusively looked upon in this light, p. 423.--When the system of blood-money prevails, the price paid for the life of a slave less than that paid for the life of a freeman, _ibid._--Among the nations of archaic culture, also, the life of a slave held in less estimation than that of a freeman, but not even the master in all circumstances allowed to put his slave to death, pp. 423-426.--Efforts of the Christian Church to secure the life of the slave against the violence of the master, p. 426.--But neither the ecclesiastical nor the secular legislation gave him the same protection as was bestowed upon the free member of the Church and State, pp. 426-428.--In modern times, in Christian countries, the life of the negro slave was only inadequately protected by law, p. 428 _sq._--Why the life of a slave is held in so little regard, p. 429.--The killing of a freeman by a slave, especially if the victim be his owner, commonly punished more severely than if the same act were done by a free person, p. 429 _sq._--In the estimate of life a distinction also made between different classes of freemen, p. 430 _sq._--The magnitude of the crime may depend not only on the rank of the victim, but on the rank of the manslayer as well, pp. 431-433. --Explanation of this influence of class, p. 433.--In progressive societies each member of the society at last admitted to be born with an equal claim to the right to live, _ibid._

CHAPTER XIX

HUMAN SACRIFICE

The prevalence of human sacrifice, pp. 434-436.--This practice much more frequently found among barbarians and semi-civilised peoples than among genuine savages, p. 436 _sq._--Among some peoples it has been noticed to become increasingly prevalent in the course of time, p. 437.--Human sacrifice partly due to the idea that gods have an appetite for human flesh or blood, p. 437 _sq._--Sometimes connected with the idea that gods require attendants, p. 438.--Moreover, an angry god may be appeased simply by the death of him or those who aroused his anger, or of some representative of the offending community, or of somebody belonging to the kin of the offender, pp. 438-440.--Human sacrifice chiefly a method of life-insurance, based on the idea of substitution, p. 440.--Human victims offered in war, before a battle, or during a siege, p. 440 _sq._--For the purpose of stopping or preventing epidemics, p. 441 _sq._--For the purpose of putting an end to a devastating famine, p. 442 _sq._--For the purpose of preventing famine, p. 443 _sq._--Criticism of Dr. Frazer's hypothesis that the human victim who is killed for the purpose of ensuring good crops is regarded as a representative of the corn-spirit and is slain as such, pp. 444-451.--Human victims offered with a view to getting water, p. 451 _sq._--With a view to averting perils arising from the sea or from rivers, pp. 452-454.--For the purpose of preventing the death of some particular individual, especially a chief or a king, from sickness, old age, or other circumstances, pp. 454-457.--For the purpose of helping other men into existence, p. 457 _sq._--The killing of the first-born child, or the first-born son, p. 458 _sq._--Explanation of this practice, pp. 459-461.--Human sacrifices offered in connection with the foundation of buildings, p. 461 _sq._--The building-sacrifice, like other kinds of human sacrifice, probably based on the idea of substitution, pp.462-464. --The belief that {xvii} the soul of the victim is converted into a protecting demon, p. 464 _sq._--The human victim regarded as a messenger, p. 465 _sq._--Human sacrifice not an act of wanton cruelty, p. 466.--The king or chief sometimes sacrificed, _ibid._--The victims frequently prisoners of war or other aliens, or slaves, or criminals, pp. 466-468.--The disappearance of human sacrifice, p. 468.--Human sacrifice condemned, p. 465 _sq._--Practices intended to replace it, p. 469.--Human effigies or animals offered instead of men, p. 469 _sq._--Human sacrifices succeeded by practices involving the effusion of human blood without loss of life, p. 470.--Bleeding or mutilation practised for the same purpose as human sacrifice, p. 470 _sq._--Why the penal sacrifice of offenders has outlived all other forms of human sacrifice, p. 471.--Human beings sacrificed to the dead in order to serve them as slaves, wives, or companions, pp. 472-474.--This custom dwindling into a survival, p. 475.--The funeral sacrifice of men and animals also seems to involve an intention to vivify the spirits of the deceased with blood, p. 475 _sq._--Manslayers killed in order to satisfy their victims' craving for revenge, p. 476.

CHAPTER XX

BLOOD-REVENGE AND COMPENSATION--THE PUNISHMENT OF DEATH

The prevalence of the custom of blood-revenge, pp. 477-479.--Blood-revenge regarded not only as a right, but as a duty, p. 479 _sq._--This duty in the first place regarded as a duty to the dead, whose spirit is believed to find no rest after death until the injury has been avenged, p. 481 _sq._--Blood-revenge a form of human sacrifice, p. 482.--Blood-revenge also practised on account of the injury inflicted on the survivors, p. 482 _sq._--Murder committed within the family or kin left unavenged, p. 483.--The injury inflicted on the relatives of the murdered man suggests not only revenge, but reparation, _ibid._--The taking of life for life may itself, in a way, serve as compensation, p. 483 _sq._--Various methods of compensation, p. 484.--The advantages of the practice of composition, p. 484 _sq._--Its disadvantages, p. 485.--The importance of these disadvantages depends on the circumstances in each special case, p. 486 _sq._--Among many peoples the rule of revenge strictly followed, and to accept compensation considered disgraceful, p. 487.--The acceptance of compensation does not always mean that the family of the slain altogether renounce their right of revenge, p. 487 _sq._--The acceptance of compensation allowed as a justifiable alternative for blood-revenge, or even regarded as the proper method of settling the case, p. 488 _sq._--The system of compensation partly due to the pressure of some intervening authority, p. 489 _sq._--The adoption of this method for the settling of disputes a sign of weakness, p. 491.--When the central power of jurisdiction is firmly established, the rule of life for life regains its sway, _ibid._--A person may forfeit his right to live by other crimes besides homicide, p. 491 _sq._--Opposition to and arguments against capital punishment, pp. 492-495.--Modern legislation has undergone a radical change with reference to capital punishment, p. 495.--Arguments against its abolition, p. 495 _sq._--The chief motive for retaining it in modern legislation, p. 496.

CHAPTER XXI

THE DUEL

Duelling resorted to as a means of bringing to an end hostilities between different groups of people, p. 497 _sq._--Duels fought for the purpose of settling disputes between individuals, either by conferring on the victor the right of possessing {xviii} the object of the strife, or by gratifying a craving for revenge and wiping off the affront, pp. 498-502.--The circumstances to which these customs are due, p. 503 _sq._--The duel as an ordeal or "judgment of God," p. 504 _sq._--The judicial duel fundamentally derived its efficacy as a means of ascertaining the truth from its connection with an oath, p. 505 _sq._ How it came to be regarded as an appeal to the justice of God, p. 506 _sq._--The decline and disappearance of the judicial duel, p. 507.--The modern duel of honour, pp. 507-509.--Its causes, p. 509.--Arguments adduced in support of it, p. 509 _sq._

CHAPTER XXII

BODILY INJURIES

In the case of bodily injuries the magnitude of the offence, other things being equal, proportionate to the harm inflicted, pp. 511-513.--The degree of the offence also depends on the station of the parties concerned, and in some cases the infliction of pain held allowable or even a duty, p. 513.--Children using violence against their parents, _ibid._--Parents' right to inflict corporal punishment on their children, p. 513 _sq._--The husband's right to chastise his wife, pp. 514-516.--The master's right to inflict corporal punishment on his slave, p. 516 _sq._--The maltreatment of another person's slave regarded as an injury done to the master, rather than to the slave, p. 517.--Slaves severely punished for inflicting bodily injuries on freemen, p. 510.--The penalties or fines for bodily injuries influenced by the class or rank of the parties when both of them are freemen, p. 518 _sq._--Distinction between compatriots and aliens with reference to bodily injuries, p. 519.--The infliction of sufferings on vanquished enemies, p. 519 _sq._--The right to bodily integrity influenced by religious differences, p. 520--Forfeited by the commission of a crime, p. 520 _sq._--Amputation or mutilation of the offending member has particularly been in vogue among peoples of culture, p. 521 _sq._--The disappearance of corporal punishment in Europe, p. 522.--Corporal punishment has been by preference a punishment for poor and common people or slaves, p. 522 _sq._--The status of a person influencing his right to bodily integrity with reference to judicial torture, p. 523 _sq._--Explanation of the moral notions regarding the infliction of bodily injuries, p. 524.--The notions that an act of bodily violence involves a gross insult, and that corporal punishment disgraces the criminal more than any other form of penalty, p. 524 _sq._

CHAPTER XXIII

CHARITY AND GENEROSITY

The mother's duty to rear her children, p. 526.--The husband's and father's duty to protect and support his family, pp. 526-529.--The parents' duty of taking care of their offspring in the first place based on the sentiment of parental affection, p. 529.--The universality not only of the maternal, but of the paternal, sentiment in mankind, pp. 529-532.--Marital affection among savages, p. 532.--Explanation of the simplest paternal and marital duties, p. 533--Children's duty of supporting their aged parents, pp. 533-538. The duty of assisting brothers and sisters, p. 538.--Of assisting more distant relatives, pp. 538-540.--Uncivilised peoples as a rule described as kind towards members of their own community or tribe, enjoin charity between themselves as a duty, and praise generosity as a virtue, pp. 540-546.--Among many savages the old people, in particular, have a claim to support and assistance, p. 546.--The sick often carefully attended to, pp. 546-548.-- {xix} Accounts of uncharitable savages, p. 548 _sq._--Among semi-civilised and civilised nations charity universally regarded as a duty, and often strenuously enjoined by their religions, pp. 549-556.--In the course of progressing civilisation the obligation of assisting the needy has been extended to wider and wider circles of men, pp. 556-558.--The duty of tending wounded enemies in war, p. 558.--Explanation of the gradual expansion of the duty of charity, p. 559.--This duty in the first place based on the altruistic sentiment, p. 559 _sq._--Egoistic motives for the doing of good to fellow-creatures, p. 560.--By niggardliness a person may expose himself to supernatural dangers, pp. 560-562.--Liberality may entail supernatural reward, p. 562 _sq._ --The curses and blessings of the poor partly account for the fact that charity has come to be regarded as a religious duty, pp. 563-565.--The chief cause of the extraordinary stress which the higher religions put on the duty of charity seems to lie in the connection between almsgiving and sacrifice, the poor becoming the natural heirs of the god, p. 565.--Instances of sacrificial food being left for, or distributed among, the poor, p. 565 _sq._--Almsgiving itself regarded as a form of sacrifice, or taking the place of it, pp. 566-569.

CHAPTER XXIV

HOSPITALITY

Instances of great kindness displayed by savages towards persons of a foreign race, pp. 570-572.--Hospitality a universal custom among the lower races and among the peoples of culture at the earlier stages of their civilisation, pp. 572-574.--The stranger treated with special marks of honour, and enjoying extraordinary privileges as a guest, pp. 574-576.--Custom may require that hospitality should be shown even to an enemy, p. 576 _sq._--To protect a guest looked upon as a most stringent duty, p. 577 _sq._--Hospitality in a remarkable degree associated with religion, pp. 578-580.--The rules of hospitality in the main based on egoistic considerations, p. 581.--The stranger, supposed to bring with him good luck or blessings, pp. 581-583.--The blessings of a stranger considered exceptionally powerful, p. 583 _sq._--The visiting stranger regarded as a potential source of evil, p. 584.--His evil wishes and curses greatly feared, owing partly to his quasi-supernatural character, partly to the close contact in which he comes with the host and his belongings, pp. 584-590.--Precautions taken against the visiting stranger, pp. 590-593.--Why no payment is received from a guest, p. 593 _sq._--The duty of hospitality limited by time, p. 594 _sq._--The cause of this, p. 595 _sq._--The decline of hospitality in progressive communities, p. 596.

CHAPTER XXV

THE SUBJECTION OF CHILDREN

The right of personal freedom never absolute, p. 597.--Among some savages a man's children are in the power of the head of their mother's family or of their maternal uncle, p. 597 _sq._--Among the great bulk of existing savages children are in the power of their father, though he may to some extent have to share his authority with the mother, p. 598 _sq._--The extent of the father's power subject to great variations, p. 599.--Among some savages the father's authority practically very slight, p. 599 _sq._--Other savages by no means deficient in filial piety, p. 600 _sq._--The period during which the paternal authority lasts, p. 601 _sq._--Old age commands respect and gives authority, pp. 603-605.--Superiority of age also gives a certain amount {xx} of power, p. 605 _sq._--The reverence for old age may cease when the grey-head becomes an incumbrance to those around him, and imbecility may put an end to the father's authority over his family, p. 606 _sq._--Paternal, or parental, authority and filial reverence at their height among peoples of archaic culture, pp. 607-613.--Among these peoples we also meet with reverence for the elder brother, for persons of a superior age generally, and especially for the aged, p. 614 _sq._--Decline of the paternal authority in Europe, p. 615 _sq._--Christianity not unfavourable to the emancipation of children, though obedience to parents was enjoined as a Christian duty, p. 616 _sq._--The Roman notions of paternal rights and filial duties have to some extent survived in Latin countries, p. 617 _sq._--Sources of the parental authority, p. 618 _sq._--Among savages, in particular, filial regard is largely regard for one's elders or the aged, p. 619.--Causes of the regard for old age, pp. 619-621.--The chief cause of the connection between filial submissiveness and religious beliefs the extreme importance attached to parental curses and blessings, pp. 621-626.--Why the blessings and curses of parents are supposed to possess an unusual power, p. 626 _sq._--Explanation of the extraordinary development of the paternal authority in the archaic State, p. 627 _sq._--Causes of the downfall of the paternal power, p. 628.

CHAPTER XXVI

THE SUBJECTION OF WIVES

Among the lower races the wife frequently said to be the property or slave of her husband, p. 629 _sq._--Yet even in such cases custom has not left her entirely destitute of rights, p. 630 _sq._--The so-called absolute authority of husbands over their wives not to be taken too literally, p. 631 _sq._--The bride-price does not _eo ipso_ confer on the husband absolute rights over her, p. 632 _sq._--The hardest drudgeries of life often said to be imposed on the women, p. 633 _sq._--In early society each sex has its own pursuits, p. 634.--The rules according to which the various occupations of life are divided between the sexes are on the whole in conformity with the indications given by nature, p. 635 _sq._--This division of labour emphasised by custom and superstition, p. 636 _sq._--It is apt to mislead the travelling stranger, p. 637.--It gives the wife authority within the circle which is exclusively her own, _ibid._--Rejection of the broad statement that the lower races in general hold their women in a state of almost complete subjection, pp. 638-646.--The opinion that a people's civilisation may be measured by the position held by the women not correct, at least so far as the earlier stages of culture are concerned, p. 646 _sq._--The position of woman among the peoples of archaic civilisation, pp. 647-653.--Christianity tended to narrow the remarkable liberty granted to married women under the Roman Empire, p. 653 _sq._--Christian orthodoxy opposed to the doctrine that marriage should be a contract on the footing of perfect equality between husband and wife, p. 654 _sq._--Criticism of the hypothesis that the social _status_ of women is connected with the system of tracing descent, p. 655 _sq._--The authority of a husband who lives with his wife in the house or community of her father, p. 656 _sq._--Wives' subjection to their husbands in the first place due to the men's instinctive desire to exert power, and to the natural

inferiority of women in such qualities of body and mind as are essential for personal independence, p. 657.--Elements in the sexual impulse which lead to domination on the part of the man and to submission on the part of the woman, p. 657 _sq._--But if the man's domination is carried beyond the limits of female love, the woman feels it as a burden, p. 658 _sq._--In extreme cases of oppression, at any rate, the community at large would sympathise with her, and the public resentment against the oppressor would result in customs or laws limiting the {xxi} husband's rights, p. 659.--The offended woman may count upon the support of her fellow-sisters, _ibid._--The children's affection and regard for their mother gives her power, _ibid._--The influence which economic conditions exercise on the position of woman, pp. 659-661.--The status of wives connected with the ideas held about the female sex in general, p. 661.--Woman regarded as intellectually and morally vastly inferior to man, especially among nations more advanced in culture, pp. 661-663. --Progress in civilisation has exercised an unfavourable influence on the position of woman by widening the gulf between the sexes, p. 663.--Religion has contributed to her degradation by regarding her as unclean, p. 663 _sq._--Women excluded from religious worship and sacred functions, pp. 664-666.--The notion that woman is unclean, however, gives her a secret power over her husband, as women are supposed to be better versed in magic than men, pp. 666-668.--The curses of women greatly feared, p. 668.--Woman as an asylum, p. 668 _sq._--In archaic civilisation the _status_ of married women was affected by the fact that the house-father was invested with some part of the power which formerly belonged to the clan, p. 669.--Causes of the decrease of the husband's authority over his wife in modern civilisation, _ibid._

CHAPTER XXVII

SLAVERY

Definition of slavery, p. 670 _sq._--The distribution of slavery and its causes among savages, pp. 671-674.--The earliest source of slavery was probably war or conquest, p. 674 _sq._--Intra-tribal slavery among savages, p. 675 _sq._--The master's power over his slave among slave-holding savages, pp. 676-678.--Among the lower races slaves are generally treated kindly, pp. 678-680.--Intra-tribal slaves, especially such as are born in the house, generally treated better than extra-tribal or purchased slaves, p. 680 _sq._--Slavery among the nations of archaic culture, pp. 681-693.--The attitude of Christianity towards slavery, pp. 693-700.--The supposed causes of the extinction of slavery in Europe, pp. 697-701.--The chief cause the transformation of slavery into serfdom, p. 701.--Serfdom only a transitory condition leading up to a state of entire liberty, pp. 701-703.--The attitude of the Church towards serfdom, p. 703 _sq._--The negro slavery in the colonies of European countries and the Southern States of America, and the legislation relating to it, pp. 704-711.--The support given to it by the clergy, pp. 711-713.--The want of sympathy for, or positive antipathy to, the coloured race, p. 713 _sq._--The opinions regarding slavery and the condition of slaves influenced by altruistic considerations, p. 714 _sq._--The condition of slaves influenced by the selfish considerations of their masters, p. 715 _sq._

THE ORIGIN AND DEVELOPMENT OF THE MORAL IDEAS

THE ORIGIN AND DEVELOPMENT OF THE MORAL IDEAS

INTRODUCTORY

THE main object of this book will perhaps be best explained by a few words concerning its origin.

Its author was once discussing with some friends the point how far a bad man ought to be treated with kindness. The opinions were divided, and, in spite of much deliberation, unanimity could not be attained. It seemed strange that the disagreement should be so radical, and the question arose, Whence this diversity of opinion? Is it due to defective knowledge, or has it a merely sentimental origin? And the problem gradually expanded. Why do the moral ideas in general differ so greatly? And, on the other hand, why is there in many cases such a wide agreement? Nay, why are there any moral ideas at all?

Since then many years have passed, spent by the author in trying to find an answer to these questions. The present work is the result of his researches and thoughts.

The first part of it will comprise a study of the moral concepts: right, wrong, duty, justice, virtue, merit, &c. Such a study will be found to require an examination into the moral emotions, their nature and origin, as also into the relations between these emotions and the various {2} moral concepts. There will then be a discussion of the phenomena to which such concepts are applied--the subjects of moral judgments. The general character of these phenomena will be scrutinised, and an answer sought to the question why facts

of a certain type are matters of moral concern, while other facts are not. finally, the most important of these phenomena will be classified, and the moral ideas relating to each class will be stated, and, so far as possible, explained.

An investigation of this kind cannot be confined to feelings and ideas prevalent in any particular society or at any particular stage of civilisation. Its subject-matter is the moral consciousness of mankind at large. It consequently involves the survey of an unusually rich and varied field of research--psychological, ethnographical, historical, juridical, theological. In the present state of our knowledge, when monographs on most of the subjects involved are wanting, I presume that such an undertaking is, strictly speaking, too big for any man; at any rate it is so for the writer of this book. Nothing like completeness can be aimed at. Hypotheses of varying degrees of probability must only too often be resorted to. Even the certainty of the statements on which conclusions are based is not always beyond a doubt. But though fully conscious of the many defects of his attempt, the author nevertheless ventures to think himself justified in placing it before the public. It seems to him that one of the most important objects of human speculation cannot be left in its present state of obscurity; that at least a glimpse of light must be thrown upon it by researches which have extended over some fifteen years; and that the main principles underlying the various customs of mankind may be arrived at even without subjecting these customs to such a full and minute treatment as would be required of an anthropological monograph.

Possibly this essay, in spite of its theoretical character, may even be of some practical use. Though rooted in the emotional side of our nature, our moral {3} opinions are in a large measure amenable to reason. Now in every society the traditional notions as to what is good or bad, obligatory or indifferent, are commonly accepted by the majority of people without further reflection. By tracing them to their source it will be found that not a few of these notions have their origin in sentimental likings and antipathies, to which a scrutinising and enlightened judge can attach little importance; whilst, on the other hand, he must account blamable many an act and omission which public opinion, out of thoughtlessness, treats with indifference. It will, moreover, appear that a moral estimate often survives the cause from which it sprang. And no unprejudiced person can help changing his views if he be persuaded that they have no foundation in existing facts.

CHAPTER I

THE EMOTIONAL ORIGIN OF MORAL JUDGMENTS

THAT the moral concepts are ultimately based on emotions either of indignation or approval, is a fact which a certain school of thinkers have in vain attempted to deny. The terms which embody these concepts must originally have been used--indeed they still constantly are so used--as direct expressions of such emotions with reference to the phenomena which evoked them. Men pronounced certain acts to be good or bad on account of the emotions those acts aroused in their minds, just as they called sunshine warm and ice cold on account of certain sensations which they experienced, and as they named a thing pleasant or painful because they felt pleasure or pain. But to attribute a quality to a thing is never the same as merely to state the existence of a particular sensation or feeling in the mind which perceives it. Such an attribution must mean that the thing, under certain circumstances, makes a certain impression on the mind. By calling an object warm or pleasant, a person asserts that it is apt to produce in him a sensation of heat or a feeling of pleasure. Similarly, to name an act good or bad, ultimately implies that it is apt to give rise to an emotion of approval or disapproval in him who pronounces the judgment. Whilst not affirming the actual existence of any specific emotion in the mind of the person judging or of anybody else, the predicate of a moral judgment attributes to the subject a tendency to arouse an emotion. The moral {5} concepts, then, are essentially generalisations of tendencies in certain phenomena to call forth moral emotions.

However, as is frequently the case with general terms, these concepts are mentioned without any distinct idea of their contents. The relation in which many of them stand to the moral emotions is complicated; the use of them is often vague; and ethical theorisers, instead of subjecting them to a careful analysis, have done their best to increase the confusion by adapting the meaning of the terms to fit their theories. Very commonly, in the definition of the goodness or badness of acts, reference is made, not to their tendencies to evoke emotions of approval or indignation, but to the causes of these tendencies, that is, to those qualities in the acts which call forth moral emotions. Thus, because good acts generally produce pleasure and bad acts pain, goodness and badness have been identified with the tendencies of acts to produce pleasure or pain. The following statement of Sir James Stephen is a clearly expressed instance of this confusion, so common among utilitarians:--"Speaking generally, the acts which are called right do promote, or are supposed to promote general happiness, and the acts which are called wrong do diminish, or are supposed to diminish it. I say, therefore, that this is what the words 'right' and 'wrong' mean, just as the words 'up' and 'down' mean that which

points from or towards the earth's centre of gravity, though they are used by millions who have not the least notion of the fact that such is their meaning, and though they were used for centuries and millenniums before any one was or even could be aware of it."[1] So, too, Bentham maintained that words like "ought," "right," and "wrong," have no meaning unless interpreted in accordance with the principle of utility;[2] and James Mill was of opinion that "the very morality" of the act lies, not in the sentiments raised in the breast of him who perceives or contemplates it, but in "the consequences of the act, good or evil, and their being {6} within the intention of the agent."[3] He adds that a rational assertor of the principle of utility approves of an action "because it is good," and calls it good "because it conduces to happiness."[4] This, however, is to invert the sequence of the facts, since, properly speaking, an act is called good because it is approved of, and is approved of by an utilitarian in so far as it conduces to happiness.

[Footnote 1: Stephen, _Liberty_, _Equality_, _Fraternity_, p. 338.]

[Footnote 2: Bentham, _Principles of Morals and Legislation_, p. 4.]

[Footnote 3: James Mill, _Fragment on Mackintosh_, pp. 5, 376.]

[Footnote 4: _Ibid._ p. 368.]

Such confusion of terms cannot affect the real meaning of the moral concepts. It is true that he who holds that "actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness,"[5] may, by a merely intellectual process, pass judgment on the moral character of particular acts; but, if he is an utilitarian from conviction, his first principle, at least, has an emotional origin. The case is similar with many of the moral judgments ordinarily passed by men. They are applications of some accepted general rule: conformity or non-conformity to the rule decides the rightness or wrongness of the act judged of. But whether the rule be the result of a person's independent deductions, or be based upon authority, human or divine, the fact that his moral consciousness recognises it as valid implies that it has an emotional sanction in his own mind.

[Footnote 5: Stuart Mill, _Utilitarianism_, p. 9 _sq._]

Whilst the import of the predicate of a moral judgment may thus in every case be traced back to an emotion in him who pronounces the judgment, it is generally assumed to possess the character of universality or "objectivity" as well. The statement that an act is good or bad does not merely refer to an individual emotion; as will be shown subsequently, it always has reference to an emotion of a more public character. Very often it even implies some vague assumption that the act must be recognised as good or bad by everybody who possesses a sufficient knowledge of the case and of all attendant circumstances, and who has a "sufficiently developed" {7} moral consciousness. We are not willing to admit that our moral convictions are a mere matter of taste, and we are inclined to regard convictions differing from our own as errors. This characteristic of our moral judgments has been adduced as an argument against the emotionalist theory of moral origins, and has led to the belief that the moral concepts represent qualities which are discerned by reason.

Cudworth, Clarke, Price, and Reid are names which recall to our mind a theory according to which the morality of actions is perceived by the intellect, just as are number, diversity, causation, proportion. "Morality is eternal and immutable," says Richard Price. "Right and wrong, it appears, denote what actions are. Now whatever any thing is, that it is, not by will, or degree, or power, but by nature and necessity. Whatever a triangle or circle is, that it is unchangeably and eternally. . . . The same is to be said of right and wrong, of moral good and evil, as far as they express real characters of actions. They must immutably and necessarily belong to those actions of which they are truly affirmed."[6] And as having a real existence outside the mind, they can only be discerned by the understanding. It is true that this discernment is accompanied with an emotion: "Some impressions of pleasure or pain, satisfaction or disgust, generally attend our perceptions of virtue and vice. But these are merely their effects and concomitants, and not the perceptions themselves, which ought no more to be confounded with them, than a particular truth (like that for which Pythagoras offered a hecatomb) ought to be confounded with the pleasure that may attend the discovery of it."[7]

[Footnote 6: Price, _Review of the Principal Questions in Morals_, pp. 63, 74 _sq._]

[Footnote 7: _Ibid._ p. 63.]

According to another doctrine, the moral predicates, though not regarded as expressions of "theoretical" truth, nevertheless derive all their import from reason from "practical" or "moral" reason, as it is variously {8} called. Thus Professor Sidgwick holds that the fundamental notions represented by the word "ought" or "right," which moral judgments contain expressly or by implication, are essentially different from all notions representing facts of physical or psychical experience, and he refers such judgments to the

"reason," understood as a faculty of cognition. By this he implies "that what ought to be is a possible object of knowledge, _i.e._, that what I judge ought to be, must, unless I am in error, be similarly judged by all rational beings who judge truly of the matter." The moral judgments contain moral _truths_, and "cannot legitimately be interpreted as judgments respecting the present or future existence of human feelings or any facts of the sensible world."[8]

[Footnote 8: Sidgwick, _Methods of Ethics_, pp. 25, 33 _sq._]

Yet our tendency to objectivise the moral judgments is no sufficient ground for referring them to the province of reason. If, in this respect, there is a difference between these judgments and others that are rooted in the subjective sphere of experience, it is, largely, a difference in degree rather than in kind. The aesthetic judgments, which indisputably have an emotional origin, also lay claim to a certain amount of "objectivity." By saying of a piece of music that it is beautiful, we do not merely mean that it gives ourselves aesthetic enjoyment, but we make a latent assumption that it must have a similar effect upon everybody who is sufficiently musical to appreciate it. This objectivity ascribed to judgments which have a merely subjective origin springs in the first place from the similarity of the mental constitution of men, and, generally speaking, the tendency to regard them as objective is greater in proportion as the impressions vary less in each particular case. If "there is no disputing of tastes," that is because taste is so extremely variable; and yet even in this instance we recognise a certain "objective" standard by speaking of a "bad" and a "good" taste. On the other hand, if the appearance of objectivity in the moral judgments is so illusive as to {9} make it seem necessary to refer them to reason, that is partly on account of the comparatively uniform nature of the moral consciousness.

Society is the school in which men learn to distinguish between right and wrong. The headmaster is Custom, and the lessons are the same for all. The first moral judgments were pronounced by public opinion; public indignation and public approval are the prototypes of the moral emotions. As regards questions of morality, there was, in early society, practically no difference of opinion; hence a character of universality, or objectivity, was from the very beginning attached to all moral judgments. And when, with advancing civilisation, this unanimity was to some extent disturbed by individuals venturing to dissent from the opinions of the majority, the disagreement was largely due to facts which in no way affected the moral principle, but had reference only to its application.

Most people follow a very simple method in judging of an act. Particular modes of conduct have their traditional labels, many of which are learnt with language itself; and the moral judgment commonly consists simply in labelling the act according to certain obvious characteristics which it presents in common with others belonging to the same group. But a conscientious and intelligent judge proceeds in a different manner. He carefully examines all the details connected with the act, the external and internal conditions under which it was performed, its consequences, its motive; and, since the moral estimate in a large measure depends upon the regard paid to these circumstances, his judgment may differ greatly from that of the man in the street, even though the moral standard which they apply be exactly the same. But to acquire a full insight into all the details which are apt to influence the moral value of an act is in many cases anything but easy, and this naturally increases the disagreement. There is thus in every advanced society a diversity of opinion regarding the moral value of certain modes of conduct which results from circumstances of a purely {10} intellectual character--from the knowledge or ignorance of positive facts,--and involves no discord in principle.

Now it has been assumed by the advocates of various ethical theories that all the differences of moral ideas originate in this way, and that there is some ultimate standard which must be recognised as authoritative by everybody who understands it rightly. According to Bentham, the rectitude of utilitarianism has been contested only by those who have not known their own meaning:--"When a man attempts to combat the principle of utility . . . his arguments, if they prove anything, prove not that the principle is wrong, but that, according to the applications he supposes to be made of it, it is misapplied."[9] Mr. Spencer, to whom good conduct is that "which conduces to life in each and all," believes that he has the support of "the true moral consciousness," or "moral consciousness proper," which, whether in harmony or in conflict with the "pro-ethical" sentiment, is vaguely or distinctly recognised as the rightful ruler.[10] Samuel Clarke, the intuitionist, again, is of opinion that if a man endowed with reason denies the eternal and necessary moral differences of things, it is the very same "as if a man that has the use of his sight, should at the same time that he beholds the sun, deny that there is any such thing as light in the world; or as if a man that understands Geometry or Arithmetick, should deny the most obvious and known proportions of lines or numbers."[11] In short, all disagreement as to questions of morals is attributed to ignorance or misunderstanding.

[Footnote 9: Bentham, _Principles of Morals and Legislation_, p. 4 _sq._]

[Footnote 10: Spencer, _Principles of Ethics_, i. 45, 337 _sq._]

[Footnote 11: Clarke, _Discourse concerning the Unchangeable Obligations of Natural Religion_, p. 179.]

The influence of intellectual considerations upon moral judgments is certainly immense. We shall find that the evolution of the moral consciousness to a large extent consists in its development from the unreflecting to the reflecting, from the unenlightened to the enlightened. All higher emotions are determined by cognitions, they arise {11} from "the presentation of determinate objective conditions";[12] and moral enlightenment implies a true and comprehensive presentation of those objective conditions by which the moral emotions, according to their very nature, are determined. Morality may thus in a much higher degree than, for instance, beauty be a subject of instruction and of profitable discussion, in which persuasion is carried by the representation of existing data. But although in this way many differences may be accorded, there are points in which unanimity cannot be reached even by the most accurate presentation of facts or the subtlest process of reasoning.

[Footnote 12: Marshall, _Pain_, _Pleasure_, _and Aesthetics_, p. 83.]

Whilst certain phenomena will almost of necessity arouse similar moral emotions in every mind which perceives them clearly, there are others with which the case is different. The emotional constitution of man does not present the same uniformity as the human intellect. Certain cognitions inspire fear in nearly every breast; but there are brave men and cowards in the world, independently of the accuracy with which they realise impending danger. Some cases of suffering can hardly fail to awaken compassion in the most pitiless heart; but the sympathetic dispositions of men vary greatly, both in regard to the beings with whose sufferings they are ready to sympathise, and with reference to the intensity of the emotion. The same holds good for the moral emotions. The existing diversity of opinion as to the rights of different classes of men and of the lower animals, which springs from emotional differences, may no doubt be modified by a clearer insight into certain facts, but no perfect agreement can be expected as long as the conditions under which the emotional dispositions are formed remain unchanged. Whilst an enlightened mind _must_ recognise the complete or relative irresponsibility of an animal, a child, or a madman, and _must_ be influenced in its moral judgment by the motives of an act--no intellectual enlightenment, no scrutiny of facts, can decide how far the interests of the {12} lower animals should be regarded when conflicting with those of men, or how far a person is bound, or allowed, to promote the welfare of his nation, or his own welfare, at the cost of that of other nations or other individuals. Professor Sidgwick's well-known moral axiom, "I ought not to prefer my own lesser good to the greater good of another,"[13] would, if explained to a Fuegian or a Hottentot, be regarded by him, not as self-evident, but as simply absurd; nor can it claim general acceptance even among ourselves. Who is that "Another" to whose greater good I ought not to prefer my own lesser good? A fellow-countryman, a savage, a criminal, a bird, a fish--all without distinction? It will, perhaps, be argued that on this, and on all other points of morals, there would be general agreement, if only the moral consciousness of men were sufficiently developed.[14] But then, when speaking of a "sufficiently developed" moral consciousness (beyond insistence upon a full insight into the governing facts of each case), we practically mean nothing else than agreement with our own moral convictions. The expression is faulty and deceptive, because, if intended to mean anything more, it presupposes an objectivity of the moral judgments which they do not possess, and at the same time seems to be proving what it presupposes. We may speak of an intellect as sufficiently developed to grasp a certain truth, because truth is objective; but it is not proved to be objective by the fact that it is recognised as true by a "sufficiently developed" intellect. The objectivity of truth lies in the recognition of facts as true by all who understand them _fully_, whilst the appeal to a _sufficient_ knowledge assumes their objectivity. To the verdict of a perfect intellect, that is, an intellect which knows everything existing, all would submit; but we can form no idea of a moral consciousness which could lay claim to a similar authority. If the believers in an all-good {13} God, who has revealed his will to mankind, maintain that they in this revelation possess a perfect moral standard, and that, consequently, what is in accordance with such a standard must be objectively right, it may be asked what they mean by an "all-good" God. And in their attempt to answer this question, they would inevitably have to assume the objectivity they wanted to prove.

[Footnote 13: Sidgwick, _op. cit._ p. 383.]

[Footnote 14: This, in fact, was the explanation given by Professor Sidgwick himself in a conversation which I had with him regarding his moral axioms.]

The error we commit by attributing objectivity to moral estimates becomes particularly conspicuous when we consider that these estimates have not only a certain quality, but a certain quantity. There are different degrees of badness and goodness, a duty may be more or less stringent, a merit may be smaller or greater.[15] These quantitative differences are due to the emotional origin of all moral concepts. Emotions vary in intensity almost indefinitely, and the moral emotions form no exception to this rule. Indeed, it may be fairly doubted whether the same mode of conduct ever arouses exactly the same degree of indignation or approval in any two

individuals. Many of these differences are of course too subtle to be manifested in the moral judgment; but very frequently the intensity of the emotion is indicated by special words, or by the way in which the judgment is pronounced. It should be noticed, however, that the quantity of the estimate expressed in a moral predicate is not identical with the intensity of the moral emotion which a certain mode of conduct arouses on a special occasion. We are liable to feel more indignant if an injury is committed before our eyes than if we read of it in a newspaper, and yet we admit that the degree of wrongness is in both cases the same. The quantity of moral estimates is determined by the intensity of the emotions which their objects tend to evoke under exactly similar external circumstances.

[Footnote 15: It will be shown in a following chapter why there are no degrees of rightness. This concept implies accordance with the moral law. The adjective "right" means that duty is fulfilled.]

{14} Besides the relative uniformity of moral opinions, there is another circumstance which tempts us to objectivise moral judgments, namely, the authority which, rightly or wrongly, is ascribed to moral rules. From our earliest childhood we are taught that certain acts _are_ right and that others _are_ wrong. Owing to their exceptional importance for human welfare, the facts of the moral consciousness are emphasised in a much higher degree than any other subjective facts. We are allowed to have our private opinions about the beauty of things, but we are not so readily allowed to have our private opinions about right and wrong. The moral rules which are prevalent in the society to which we belong are supported by appeals not only to human, but to divine, authority, and to call in question their validity is to rebel against religion as well as against public opinion. Thus the belief in a moral order of the world has taken hardly less firm hold of the human mind than the belief in a natural order of things. And the moral law has retained its authoritativeness even when the appeal to an external authority has been regarded as inadequate. It filled Kant with the same awe as the star-spangled firmament. According to Butler, conscience is "a faculty in kind and in nature supreme over all others, and which bears its own authority of being so."[16] Its supremacy is said to be "felt and tacitly acknowledged by the worst no less than by the best of men."[17] Adam Smith calls the moral faculties the "vicegerents of God within us," who "never fail to punish the violation of them by the torments of inward shame and self-condemnation; and, on the contrary, always reward obedience with tranquillity of mind, with contentment, and self-satisfaction."[18] Even Hutcheson, who raises the question why the moral sense should not vary in different men as the palate does, considers it {15} "to be naturally destined to command all the other powers."[19]

[Footnote 16: Butler, 'Sermon II.--Upon Human Nature,' in _Analogy of Religion_, _&c._ p. 403.]

[Footnote 17: Dugald Stewart, _Philosophy of the Active and Moral Powers of Man_, i. 302.]

[Footnote 18: Adam Smith, _Theory of Moral Sentiments_, p. 235.]

[Footnote 19: Hutcheson, _System of Moral Philosophy_, i. 61.]

Authority is an ambiguous word. It may indicate knowledge of truth, and it may indicate a rightful power to command obedience. The authoritativeness attributed to the moral law has often reference to both kinds of authority. The moral lawgiver lays down his rules in order that they should be obeyed, and they are authoritative in so far as they have to be obeyed. But he is also believed to know what is right and wrong, and his commands are regarded as expressions of moral truths. As we have seen, however, this latter kind of authority involves a false assumption as to the nature of the moral predicates, and it cannot be justly inferred from the power to command. Again, if the notion of an external lawgiver be put aside, the moral law does not generally seem to possess supreme authority in either sense of the word. It does not command obedience in any exceptional degree; few laws are broken more frequently. Nor can the regard for it be called the mainspring of action; it is only one spring out of many, and variable like all others. In some instances it is the ruling power in a man's life, in others it is a voice calling in the desert; and the majority of people seem to be more afraid of the blame or ridicule of their fellowmen, or of the penalties with which the law threatens them, than of "the vicegerents of God" in their own hearts. That mankind prefer the possession of virtue to all other enjoyments, and look upon vice as worse than any other misery,[20] is unfortunately an imagination of some moralists who confound men as they are with men as they ought to be.

[Footnote 20: _Idem_, _Inquiry into the Original of our Ideas of Beauty and Virtue_, p. 248.]

It is said that the authority of the moral law asserts itself every time the law is broken, that virtue bears in itself its own reward, and vice its own punishment. But, to be sure, conscience is a very unjust retributer. The more a person habituates himself to virtue the more he {16} sharpens its sting, the deeper he sinks in vice the more he blunts it. Whilst the best men have the most sensitive consciences, the worst have hardly any conscience at all. It is argued that the habitual sinner has rid himself of remorse at a great

cost;[21] but it may be fairly doubted whether the loss is an adequate penalty for his wickedness. We are reminded that men are rewarded for good and punished for bad acts by the moral feelings of their neighbours. But public opinion and law judge of detected acts only. Their judgment is seldom based upon an exhaustive examination of the case. They often apply a standard which is itself open to criticism. And the feelings with which men regard their fellow-creatures, and which are some of the main sources of human happiness and suffering, have often very little to do with morality. A person is respected or praised, blamed or despised, on other grounds than his character. Nay, the admiration which men feel for genius, courage, pluck, strength, or accidental success, is often superior in intensity to the admiration they feel for virtue.

[Footnote 21: Ziegler, _Social Ethics_, p. 103.]

In spite of all this, however, the supreme authority assigned to the moral law is not altogether an illusion. It really exists in the minds of the best, and is nominally acknowledged by the many. By this I do not refer to the universal admission that the moral law, whether obeyed or not, ought under all circumstances to be obeyed; for this is the same as to say that what ought to be ought to be. But it is recognised, in theory at least, that morality, either alone or in connection with religion, possesses a higher value than anything else; that rightness and goodness are preferable to all other kinds of mental superiority, as well as of physical excellence. If this theory is not more commonly acted upon, that is due to its being, in most people, much less the outcome of their own feelings than of instruction from the outside. It is ultimately traceable to some great teacher whose own mind was ruled by the ideal of moral perfection, and whose {17} words became sacred on account of his supreme wisdom, like Confucius or Buddha,[22] or on religious grounds, like Jesus. The authority of the moral law is thus only an expression of a strongly developed, overruling moral consciousness. It can hardly, as Mr. Sidgwick maintains, be said to "depend upon" the conception of the objectivity of duty.[23] On the contrary, it must be regarded as a cause of this conception--not only, as has already been pointed out, where it is traceable to some external authority, but where it results from the strength of the individual's own moral emotions. As clearness and distinctness of the conception of an object easily produces the belief in its truth, so the intensity of a moral emotion makes him who feels it disposed to objectivise the moral estimate to which it gives rise, in other words, to assign to it universal validity. The enthusiast is more likely than anybody else to regard his judgments as true, and so is the moral enthusiast with reference to his moral judgments. The intensity of his emotions makes him the victim of an illusion.

[Footnote 22: "Besides the ideal king, the personification of Power and Justice, another ideal has played an important part in the formation of early Buddhist ideas regarding their Master. . . . It was the ideal of a perfectly Wise Man, the personification of Wisdom, the Buddha" (Rhys Davids, _Hibbert Lectures on Some Points in the History of Buddhism_, p. 141).]

[Footnote 23: Sidgwick, _op. cit._ p. 104.]

The presumed objectivity of moral judgments thus being a chimera, there can be no moral truth in the sense in which this term is generally understood. The ultimate reason for this is, that the moral concepts are based upon emotions, and that the contents of an emotion fall entirely outside the category of truth. But it may be true or not that we have a certain emotion, it may be true or not that a given mode of conduct has a tendency to evoke in us moral indignation or moral approval. Hence a moral judgment is true or false according as its subject has or has not that tendency which the predicate attributes to it. If I say that it is wrong to resist evil, and yet resistance to evil has no tendency whatever to call {18} forth in me an emotion of moral disapproval, then my judgment is false.

If there are no general moral truths, the object of scientific ethics cannot be to fix rules for human conduct, the aim of all science being the discovery of some truth. It has been said by Bentham and others that moral principles cannot be proved because they are first principles which are used to prove everything else.[24] But the real reason for their being inaccessible to demonstration is that, owing to their very nature, they can never be true. If the word "Ethics," then, is to be used as the name for a science, the object of that science can only be to study the moral consciousness as a fact.[25]

[Footnote 24: Bentham, _Principles of Morals and Legislation_, p. 4. _Cf._ Höffding, _Etik_, p. 43.]

[Footnote 25: _Cf._ Simmel, _Einleitung in die Moralwissenschaft_, i. p. iii. _sq._; Westermarck, 'Normative und psychologische Ethik,' in _Dritter Internationaler Congress für Psychologie in München_, p. 428 _sq._]

Ethical subjectivism is commonly held to be a dangerous doctrine, destructive to morality, opening the door to all sorts of libertinism. If that which appears to each man as right or good, stands for that which is right or good; if he is allowed to make his own law, or to make no law at all; then, it is said, everybody has the natural right to follow his caprice and inclinations, and to hinder

him from doing so is an infringement on his rights, a constraint with which no one is bound to comply provided that he has the power to evade it. This inference was long ago drawn from the teaching of the Sophists,[26] and it will no doubt be still repeated as an argument against any theorist who dares to assert that nothing can be said to be truly right or wrong.

[Footnote 26: Zeller, _History of Greek Philosophy_, ii. 475.]

To this argument may, first, be objected that a scientific theory is not invalidated by the mere fact that it is likely to cause mischief. The unfortunate circumstance that there do exist dangerous things in the world, proves that something may be dangerous and yet true. Another question is whether any scientific truth really is mischievous {19} on the whole, although it may cause much discomfort to certain people. I venture to believe that this, at any rate, is not the case with that form of ethical subjectivism which I am here advocating. The charge brought against the Sophists does not at all apply to it. I do not even subscribe to that beautiful modern sophism which admits every man's conscience to be an infallible guide. If we had to recognise, or rather if we did recognise, as right everything which is held to be right by anybody, savage or Christian, criminal or saint, morality would really suffer a serious loss. But we do not, and we cannot, do so. My moral judgments are my own judgments; they spring from my own moral consciousness; they judge of the conduct of other men not from their point of view but from mine, not with primary reference to their opinions about right and wrong, but with reference to my own. Most of us indeed admit that, when judging of an act, we also ought to take into consideration the moral conviction of the agent, and the agreement or disagreement between his doing and his idea of what he ought to do. But although we hold it to be wrong of a person to act against his conscience, we may at the same time blame him for having such a conscience as he has. Ethical subjectivism covers all such cases. It certainly does not allow everybody to follow his own inclinations; nor does it lend sanction to arbitrariness and caprice. Our moral consciousness belongs to our mental constitution, which we cannot change as we please. We approve and we disapprove because we cannot do otherwise. Can we help feeling pain when the fire burns us? Can we help sympathising with our friends? Are these phenomena less necessary or less powerful in their consequences, because they fall within the subjective sphere of experience? So, too, why should the moral law command less obedience because it forms part of our own nature?

Far from being a danger, ethical subjectivism seems to me more likely to be an acquisition for moral practice. {20} Could it be brought home to people that there is no absolute standard in morality, they would perhaps be somewhat more tolerant in their judgments, and more apt to listen to the voice of reason. If the right has an objective existence, the moral consciousness has certainly been playing at blindman's buff ever since it was born, and will continue to do so until the extinction of the human race. But who does admit this? The popular mind is always inclined to believe that it possesses the knowledge of what _is_ right and wrong, and to regard public opinion as the reliable guide of conduct. We have, indeed, no reason to regret that there are men who rebel against the established rules of morality; it is more deplorable that the rebels are so few, and that, consequently, the old rules change so slowly. Far above the vulgar idea that the right is a settled something to which everybody has to adjust his opinions, rises the conviction that it has its existence in each individual mind, capable of any expansion, proclaiming its own right to exist, and, if need be, venturing to make a stand against the whole world. Such a conviction makes for progress.

CHAPTER II

THE NATURE OF THE MORAL EMOTIONS

IN the preceding chapter it was asserted, in general terms, that the moral concepts are based on emotions, and the leading arguments to the contrary were met. We shall now proceed to examine the nature of the moral emotions.

These emotions are of two kinds: disapproval, or indignation, and approval. They have in common characteristics which make them moral emotions, in distinction from others of a non-moral character, but at the same time both of them belong to a wider class of emotions, which I call retributive emotions. Again, they differ from each other in points which make each of them allied to certain non-moral retributive emotions, disapproval to anger and revenge, and approval to that kind of retributive kindly emotion which in its most developed form is gratitude. They may thus, on the one hand, be regarded as two distinct divisions of the moral emotions, whilst, on the other hand, disapproval, like anger and revenge, forms a sub-species of resentment, and approval, like gratitude, forms a sub-species of retributive kindly emotion. The following diagram will help to elucidate the matter:--

Retributive Emotions. | ---------- | | Resentment. Retributive Kindly Emotion. | | ---------- ---------- | | | Anger and Moral Moral Non-moral retributive Revenge. disapproval. approval Kindly Emotion, | | including Gratitude. ---------- | Moral Emotions.

{22} That moral disapproval is a kind of resentment and akin to anger and revenge, and that moral approval is a kind of retributive kindly emotion and akin to gratitude, are, of course, statements which call for proof. An analysis of all these emotions, and a detailed study of the causes which evoke them, will, I hope, bear out the correctness of my classification. In this connection only the analysis can be attempted. The study of causes will be involved in the treatment of the subjects of moral judgments.

Resentment may be described as an aggressive attitude of mind towards a cause of pain. Anger is sudden resentment, in which the hostile reaction against the cause of pain is unrestrained by deliberation. Revenge, on the other hand, is a more deliberate form of non-moral resentment, in which the hostile reaction is more or less restrained by reason and calculation.[1] It is impossible, however, to draw any distinct limit between these two types of resentment, as also to discern where an actual desire to inflict pain comes in. In its primitive form, anger, even when directed against a living being, contains a vehement impulse to remove the cause of pain without any real desire to produce suffering.[2] Anger is strikingly shown by many fish, and notoriously by sticklebacks when their territory is invaded by other sticklebacks. In such circumstances of provocation the whole animal changes colour, and, darting at the trespasser, shows rage and fury in every movement;[3] but we can hardly believe that any idea of inflicting pain is present to its mind. As we proceed still lower down the scale of animal life we find the conative element itself gradually dwindle away until nothing is left but mere reflex action.

[Footnote 1: _Cf._ Ribot, _Psychology of the Emotions_, p. 220 _sqq._]

[Footnote 2: There are some good remarks on this in Mr. Hiram Stanley's _Studies in the Evolutionary Psychology of Feeling_, p. 138 _sq._]

[Footnote 3: Romanes, _Animal Intelligence_, p. 246 _sqq._]

That the fury of an injured animal turns against the real or assumed cause of its injury is a matter of notoriety, and everybody knows that the same is the case with the {23} anger of a child. No doubt, as Professor Sully observes, "hitting out right and left, throwing things down on the floor and breaking them, howling, wild agitated movements of the arms and whole body, these are the outward vents which the gust of childish fury is apt to take."[4] But, on the other hand, we know well enough that Darwin's little boy, who became a great adept at throwing books and sticks at any one who offended him,[5] was in this respect no exceptional child. Towards the age of one year, according to M. Perez, children "will beat people, animals, and inanimate objects if they are angry with them; they will throw their toys, their food, their plate, anything, in short, that is at hand, at the people who have displeased them."[6] That a similar discrimination characterises the resentment of a savage is a fact upon which it is necessary to dwell at some length for the reason that it has been disputed, and because there are some seeming anomalies which require an explanation.

[Footnote 4: Sully, _Studies in Childhood_, p. 232 _sq._]

[Footnote 5: Darwin, 'Biographical Sketch of an Infant,' in _Mind_, ii. 288.]

[Footnote 6: Perez, _first Three Years of Childhood_, p. 66 _sq._]

In a comprehensive work,[7] Dr. Steinmetz has made the feeling of revenge the object of a detailed investigation, which cannot be left unnoticed. The ultimate conclusions at which he has arrived are these: Revenge is essentially rooted in the feeling of power and superiority. It arises consequently upon the experience of injury, and its aim is to enhance the "self-feeling" which has been lowered or degraded by the injury suffered. It answers this purpose best if it is directed against the aggressor himself, but it is not essential to it that it should take any determinate direction, for, _per se_, and originally, it is "undirected."[8]

[Footnote 7: _Ethnologische Studien zur ersten Entwicklung der Strafe_.]

[Footnote 8: Strictly speaking, this theory is not new. Dr. Paul Rée, in his book _Die Entstehung des Gewissens_, has pronounced revenge to be a reaction against the feeling of inferiority which the aggressor impresses upon his victim. The injured man, he says (_ibid._ p. 40) is naturally reluctant to feel himself inferior to another man, and consequently strives, by avenging the aggression, to show himself equal or even superior to the aggressor. A similar view was previously expressed by Schopenhauer (_Parerga und Paralipomena_, ii. 475 _sq._). But Dr. Steinmetz has elaborated his theory with an independence and fulness which make any question of priority quite insignificant.]

{24} We are told, in fact, that the first stage through which revenge passed within the human race was characterised by a total, or almost total, want of discrimination. The aim of the offended man was merely to raise his injured "self-feeling" by inflicting pain upon

somebody else, and his savage desire was satisfied whether the man on whom he wreaked his wrath was guilty or innocent.[9] No doubt, there were from the outset instances in which the offender himself was purposely made the victim, especially if he was a fellow-tribesman; but it was not really due to the feeling of revenge if the suffering was inflicted upon him, in preference to others. Even primitive man must have found out that vengeance directed against the actual culprit, besides being a strong deterrent to others, was a capital means of making a dangerous person harmless. However, Dr. Steinmetz adds, these advantages should not be overestimated, as even indiscriminate revenge has a deterring influence on the malefactor.[10] In early times, then, vengeance, according to Dr. Steinmetz, was in the main "undirected."

[Footnote 9: Steinmetz, _op. cit._ i. 355, 356, 359, 561.]

[Footnote 10: _Ibid._ i. 362.]

At the next stage it becomes, he says, somewhat less indiscriminate. A proper victim is sought for even in cases of what we should call natural death, which the savage generally attributes to the ill-will of some foe skilled in sorcery;[11] though indeed Dr. Steinmetz doubts whether in such cases the unfortunate sufferer is really supposed to have committed the deed imputed to him.[12] At all events, a need is felt of choosing somebody for a victim, and "undirected" vengeance gradually gives way to "directed" vengeance. A rude specimen of this is the blood-feud, in which the individual culprit is left out of consideration, but war is carried on against the group of which he is a member, either his family or his tribe. And {25} from this system of joint responsibility we finally come, by slow degrees, says Dr. Steinmetz, to the modern conception, according to which punishment should be inflicted upon the criminal and nobody else.[13] Dr. Steinmetz believes that the _vis agens_ in this long process of evolution lies in the intellectual development of the human race: man found out more and more distinctly that the best means of restraining wrongs was to punish a certain person, namely, the wrong-doer.[14] On this utilitarian calculation our author lays much stress in the latter part of his investigation; whereas in another place he observes that a revenge which is directed against the offender is particularly apt to remove the feeling of inferiority, by effectually humiliating the hitherto triumphant foe.[15]

[Footnote 11: _Ibid._ i. 356 _sq._]

[Footnote 12: _Ibid._ i. 359 _sq._]

[Footnote 13: Steinmetz, _op. cit._ i. 361.]

[Footnote 14: _Ibid._ i. 358, 359, 361 _sq._]

[Footnote 15: _Ibid._ i. 111.]

In this historical account the main points of interest are the initial stage of "undirected" vengeance, and the way in which such vengeance gradually became discriminate. If, in primitive times, a man did not care in the least on whom he retaliated an injury, then of course the direction of his vengeance could not be essential to the revenge itself, but would be merely a later appendix to it. The question is, what evidence can Dr. Steinmetz adduce to support his theory? Of primitive man we have no direct experience; no savage people now existing is a faithful representative of him, either physically or mentally. Yet however greatly the human race has changed, primitive man is not altogether dead. Traits of his character still linger in his descendants; and of primitive revenge, we are told, there are sufficient survivals left.[16]

[Footnote 16: _Ibid._ i. 364.]

Under the heading "Perfectly Undirected Revenge," Dr. Steinmetz sets out several alleged cases of such so-called survivals[17] 1. An Indian of the Omaha tribe, who was kicked out of a trading establishment which he had been forbidden to enter, declared in a rage that he would revenge himself for an injury so gross, and, "seeking some object to destroy, he encountered a {26} sow and pigs, and appeased his rage by putting them all to death." 2. The people of that same tribe believe that if a man who has been struck by lightning is not buried in the proper way, and in the place where he has been killed, his spirit will not rest in peace, but will walk about till another person is slain by lightning and laid beside him. 3. At the burial of a Loucheux Indian, the relatives sometimes will cut and lacerate their bodies, or, as sometimes happens, will, "in a fit of revenge against fate," stab some poor, friendless person who may be sojourning among them. 4. The Navahoes, when jealous of their wives, are apt to wreak their spleen and ill-will upon the first person whom they chance to meet. 5. The Great Eskimo, as it is reported, once after a severe epidemic swore to kill all white people who might venture into their country. 6. The Australian father, whose little child happens to hurt itself, attacks his innocent neighbours, believing that he thus distributes the pain among them and consequently lessens the suffering of the child. 7.

The Brazilian Tupis ate the vermin which molested them, for the sake of revenge; and if one of them struck his foot against a stone, he raged over it and bit it, whilst, if he were wounded with an arrow, he plucked it out and gnawed the shaft. 8. The Dacotahs avenge theft by stealing the property of the thief or of somebody else. 9. Among the Tshatrali (Pamir), if a man is robbed of his meat by a neighbour's dog, he will, in a fit of rage, not only kill the offending dog, but will, in addition, kick his own. 10. In New Guinea the bearers of evil tidings sometimes get knocked on the head during the first outburst of indignation evoked by their news. 11. Some natives of Motu, who had rescued two shipwrecked crews and safely brought them to their home in Port Moresby, were attacked there by the very friends of those they had saved, the reason for this being that the Port Moresby people were angry at the loss of the canoes, and could not bear that the Motuans were happy while they themselves were in trouble. 12. Another story from New Guinea tells us of a man who killed some innocent persons, because he had been disappointed in his plans and deprived of valuable property. 13. Among the Maoris it sometimes happened that the friends of a murdered man killed the first man who came in their way, whether enemy or friend. 14. Among the same people, chiefs who had suffered some loss often used to rob their subjects of property in order to make good the damage. 15. If the son of a Maori is hurt, his maternal relatives, to whose tribe he is considered to belong, come to pillage his father's house or village. 16. If {27} a tree falls on a Kuki his fellows chop it up, and if one of that tribe kills himself by falling from a tree the tree from which he fell is promptly cut down. 17. In some parts of Daghestan, when the cause of a death is unknown, the relatives of the deceased declare some person chosen at random to have murdered him, and retaliate his death upon that person.

[Footnote 17: _Ibid._ i. 318 _sqq._]

I have been obliged to enumerate all these cases for the reason that a theory cannot be satisfactorily refuted unless on its own ground. I may confess at once that I scarcely ever saw an hypothesis vindicated by the aid of more futile evidence. The cases 7 and 16 illustrate just the reverse of "undirected" revenge, and, when we take into consideration the animistic beliefs of savages, present little to astonish us. In case 17 the guilt is certainly imputed to somebody at random, but only when the culprit is unknown. Cases 1, 4, 10 and 12 and perhaps also 11, imply that revenge is taken upon an innocent party in a fit of passion; in cases 1 and 12 the offender himself cannot be got at, in case 10 the man who is knocked on the head appears for the moment as the immediate cause of the grief or indignation evoked, while case 11 exhibits envy combined with extreme ingratitude. In case 9 the anger is chiefly directed against the "guilty" dog, and against the "innocent" one evidently by an association of ideas. Cases 8 and 14 illustrate indemnification for loss of property, and in case 8 the thief himself is specifically mentioned first. In case 15 the revenging attack is made upon the property of those people among whom the child lives, and who may be considered responsible for the loss its maternal clan sustains by the injury. Case 6 merely shows the attempt of a superstitious father to lessen the suffering of his child. As regards case 5, Petitot, who has recorded it, says expressly that the white people were supposed to have caused the epidemic by displeasing the god Tornrark.[18] Case 2 points to a superstitious belief which is interesting enough in itself, but which, so far as I can see, is without any bearing whatever on the point we are discussing. Case 3 looks like a death-offering. The stabbing of an innocent person is mentioned in connection with, or rather as an alternative to, the self-laceration of the mourners, which last has probably a sacrificial character. Moreover, there is in this case no question of a culprit. In case 13, finally, the idea of sacrifice is very conspicuous. Dr. Steinmetz has borrowed his statement from Waitz, whose account is incomplete. Dieffenbach, the original authority, says that the custom in question was called by the Maori _taua tapu_, _i.e._, sacred fight, {28} or _taua toto_, _i.e._, fight for blood. He describes it as follows:--"If blood has been shed, a party sally forth and kill the first person they fall in with, whether an enemy or belonging to their own tribe; even a brother is sacrificed. If they do not fall in with anybody, the _tohunga_ (that is, the priest) pulls up some grass, throws it into a river, and repeats some incantation. After this ceremony, the killing of a bird, or any living thing that comes in their way, is regarded as sufficient, provided that blood is actually shed. All who participate in such an excursion are _tapu_, and are not allowed either to smoke or to eat anything but indigenous food."[19] It seems probable that this ceremony was undertaken in order to appease the enraged spirit of the dead,[20] and at the same time it may have been intended to refresh the spirit with blood.[21] The question, however, is, Why was not his death avenged upon the actual culprit? To this Dr. Steinmetz would answer that the deceased was thought to be indiscriminate in his craving for vengeance.[22] But so far as the resentment of the dead is concerned, the "sacred fight" of the Maoris only seems to illustrate the impulsive character of anger. From Dieffenbach's description of it, it is obvious that the friends of the slain man considered it to be a matter of paramount importance that blood should be shed immediately. If no human being came in their way, an animal was killed, but then an incantation was uttered beforehand. I presume that the reason for this was the terror which the supposed wrath of the dead man's spirit struck into the living, combined perhaps with the idea that it was in immediate need of fresh blood. The Maoris considered all spirits of the dead to be maliciously inclined towards them,[23] and the ghost of a person who had died a violent death was certainly looked upon as especially dangerous. The craving for instantaneous shedding of blood is even more conspicuous in another case

which may be appropriately mentioned in this connection. The Aetas of the Philippine Islands, we are told, "do not always {29} wait for the death of the afflicted before they bury him. Immediately after the body has been deposited in the grave, it becomes necessary, according to their usages, that his death should be avenged. The hunters of the tribe go out with their lances and arrows to kill the first living creature they meet with, whether a man, a stag, a wild hog, or a buffalo."[24] Dr. Steinmetz himself quotes some other instances from the same group of islands, in which, when a man dies, his nearest kinsmen go out to requite his death by the death of the first man who comes in their way.[25] It is worth noticing that the Philippine Islanders have the very worst opinion of their ghosts, and believe that these are particularly bloodthirsty soon after death.[26]

[Footnote 19: Dieffenbach, _Travels in New Zealand_, ii. 127.]

[Footnote 20: _Cf._ _ibid._ ii. 129.]

[Footnote 21: The latter object is suggested by some funeral ceremonies which will be noticed in a following chapter. Among the Dyaks, "a father who lost his child would go out and kill the first man he met, as a funeral ceremony," believing that he thus provided the deceased with a slave to accompany him to the habitation of souls (Tylor, _Primitive Culture_, i. 459). Among the Garos, it was formerly the practice, "whenever the death of a great man amongst them occurred, to send out a party of assassins to murder and bring back the head of the first Bengali they met. The victims so immolated would, it was supposed, be acceptable to their gods" (Dalton, _Descriptive Ethnology of Bengal_, p. 68).]

Dr. Steinmetz also refers to some statements according to which, among certain Australian tribes, the relatives of a person who dies avenge his death by killing an innocent man.[27] But in these cases the avenged death, though "natural" according to our terminology, is, in the belief of the savages, caused by sorcery, and the revenge is not so indiscriminate as Dr. Steinmetz seems to assume. Among the Wellington tribe, as appears from a statement which he quotes himself, it is the sorcerer's life that must be taken for satisfaction.[28] In New South Wales, after the dead man has been interrogated as to the cause of his death, his kinsmen are resolute in taking vengeance, if they "imagine that they have got sure indications of the perpetrator of the wrong."[29] Among the Central Australian natives, "not infrequently the dying man will whisper in the ear of a _Railtchawa_, or medicine man, the name of the man whose magic is killing him," and if this be not done, "there is no difficulty, by some other method, of fixing sooner or later on the guilty party"; but only after the culprit has been revealed by the medicine man is it decided by a council of the old men whether an avenging party is to be arranged or not.[30] Among the aborigines of West Australia, the survivors are "pretty busy in seeking out" the sorcerer who is supposed to have caused the death of their friend.[31]

[Footnote 31: Calvert, _Aborigines of Western Australia_, p. 20 _sq._]

{30} To sum up: all the facts which Dr. Steinmetz has adduced as evidence for his hypothesis of an original stage of "undirected" revenge only show that, under certain circumstances, either in a fit of passion, or when the actual offender is unknown or out of reach, revenge may be taken on an innocent being, wholly unconnected with the inflicter of the injury which it is sought to revenge. There is such an intimate connection between the experience of injury and the hostile reaction by which the injured individual gives

vent to his passion, that the reaction does not fail to appear even when it misses its aim. Anger, as Seneca said, "does not rage merely against its object, but against every obstacle which it encounters on its way."[32] Many infants, when angry and powerless to hurt others, "strike their heads against doors, posts, walls of houses, and sometimes on the floor."[33] Well known are the "amucks" of the Malays, in which "the desperado assails indiscriminately friend and foe," and, with dishevelled hair and frantic look, murders or wounds all whom he meets without distinction.[34] But all this is not revenge; it is sudden anger or blind rage. Nor is it revenge in the true sense of the word if a person who has been humiliated by his superior retaliates on those under him. It is only the outburst of a wounded "self-feeling," which, when not directed against its proper object, can afford no adequate consolation to a revengeful man.

[Footnote 32: Seneca, _De ira_, iii. 1.]

[Footnote 34: Crawfurd, _History of the Indian Archipelago_, i. 67. _Cf._ Ellis, 'The Amok of the Malays,' in _Jour. of Mental Science_, xxxix. 325 _sqq._ In the Andaman Islands, it is not uncommon for a man "to vent his ill-temper, or show his resentment at any act, by destroying his own property as well as that of his neighbours" (Man, 'Aboriginal Inhabitants of the Andaman Islands,' in _Jour. Anthr. Inst._ xii. 111). Among the Kar Nicobarese, when a quarrel takes place, in serious cases, a man will probably burn his own house down (Kloss, _In the Andamans and Nicobars_, p. 310). But in these instances it is not certain whether the offended party destroys his own property in blind rage, or with some definite object in view.]

In the institution of the blood-feud some sort of collective responsibility is usually involved.[35] If the {31} offender is of another family than his victim, some of his relatives may have to expiate his deed.[36] If he belongs to another clan, the whole clan may be held responsible for it.[37] And if he is a member of another tribe, the vengeance may be wreaked upon his fellow-tribesmen indiscriminately.[38]

"Among the Fuegians," says Mr. Bridges, "etiquette and custom require that all the relatives of a murdered person should . . . visit their displeasure upon every connection of the manslayers, each personally." The avengers of blood would by no means be satisfied with a party of natives if they should actually deliver up into their hands a manslayer, or kill him themselves, "but would yet exact from all the murderer's friends tribute or infliction of injuries with sticks or stones."[39] Among the Indians of British Columbia and Vancouver Island, "grudges are handed down from father to son for generations, and friendly relations are never free from the risk of being interrupted."[40] Among the Greenlanders, the revenge for a murder generally "costs the executioner himself, his children, cousins, or other relatives their lives; or if these are inaccessible, some other acquaintance in the neighbourhood."[41] Among the Maoris, blood-revenge might be taken on any relative of the homicide, "no matter how distant."[42] In Tana, {32} revenge "is often sought in the death of the brother, or some other near relative of the culprit."[43] Among the Kabyles, "la vengeance peut porter sur chacun des membres de la famille du meurtrier, quel qu'il soit."[44] The Bedouins, according to Burckhardt, "claim the blood not only from the actual homicide, but from all his relations; and it is these claims that constitute the right of _thár_, or the blood-revenge."[45] Among the people of Ibrim, in Nubia, on the other hand, the same traveller observes, "it is

not considered as sufficient to retaliate upon any person within the fifth degree of consanguinity, as among the Bedouins of Arabia; only the brother, son, or first cousin can supply the place of the murderer."[46] Traces of collective responsibility in connection with blood-revenge are found among the Hebrews.[47] It has prevailed, or still prevails, among the Japanese[48] and Coreans,[49] the Persians[50] and Hindus,[51] the ancient Greeks[52] and Teutons.[53] It was a rule among the Welsh[54] and the Scotch in former days,[55] and is so still in Corsica,[56] Albania,[57] and among some of the Southern Slavs.[58] In Montenegro, if a homicide who cannot be caught himself has no relatives, revenge is sometimes taken on some inhabitant of the village or district to which he belongs, or even on a person who only is of the same religion and nationality as the murderer.[59] In Albania, under similar circumstances, the victim may be a person who has had nothing else to do with the offender than that he has perhaps once been speaking to him.[60]

[Footnote 59: Lago, _Memorie sulla Dalmazia_, ii. 90.]

[Footnote 60: Gop[vc]evi['c], _op. cit._ p. 325.]

There is no difficulty in explaining these facts. The following statement made by Mr. Romilly with reference {33} to the Solomon Islanders has, undoubtedly, a much wider application:--"In the cases which call for punishment, the difficulties in the way of capturing the actual culprits are greater than any one, who has not been engaged in this disagreeable work, can imagine."[61] Though it may happen that a manslayer is abandoned by his own people,[62] the system of blood-revenge more often seems to imply, not only that all the members of a group are engaged, more or less effectually, in the act of revenge, but that they mutually protect each other against the avengers. A homicide frequently provokes a war,[63] in which family stands against family, clan

against clan, or tribe against tribe. In such cases the whole group take upon themselves the deed of the perpetrator, and any of his fellows, because standing up for him, becomes a proper object of revenge. The guilt extends itself, as it were, in the eyes of the offended party. So, also, any person who lives on friendly terms with the offender, or is supposed to sympathise with him, is liable to arouse a feeling of resentment, and may consequently, in extreme cases, have to expiate his crime. Moreover, because of the close relationship which exists between the members of the sam__e group, the actual culprit will be mortified by any successful attack that the avengers make on his people, and, if he be dead, its painful and humiliating effects may still be supposed to reach his spirit. "When the offender himself is beyond the reach of direct attack," says Mr. Wilkins, "it is not beneath a Bengali's view to try to wound him through his children or other members of his family."[64] Among the South Slavonians, in a similar case, the avengers of blood first attempt to kill the father, brother, {34} or grown-up son of the murderer, "so as to inflict upon him a very heavy and painful loss"; and only when this has been tried in vain, are more distant relatives attacked.[65] The Bedouins of the Euphrates even prefer killing the chief man among the murderer's relations within the second degree to taking his own life, on the principle, "You have killed my cousin, I will kill yours."[66] And the Californian Nishinam "consider that the keenest and most bitter revenge which a man can take is, not to slay the murderer himself, but his dearest friend."[67] In these instances vengeance is exacted with reference rather to the loss suffered by the survivors than to the injury committed against the murdered man, the culprit being subjected to a deprivation similar to that which he has inflicted himself. So, also, among the Marea, if a commoner is slain by a nobleman, his death is not avenged directly on the slayer, but on some commoner who is subservient to him.[68] If, again, among the Quianganes of Luzon, a noble is killed by a plebeian, another nobleman, of the kin of the murderer, must be killed, while the murderer himself is ignored.[69] If, among the Igorrotes, a man slays a woman of another house, her nearest kinsman endeavours to slay a woman belonging to the household of the homicide, but to the guilty man himself he does nothing.[70] In all these cases the culprit is not lost sight of; vengeance is invariably wreaked upon somebody connected with him. But any consideration of guilt or innocence is overshadowed by the blind subordination to that powerful rule which requires strict equivalence between injury and punishment--an eye for an eye and a tooth for a tooth--and which, when strained to the utmost, cannot allow the life of a man to be sacrificed for that of a woman, or the life of a nobleman to be {35} sacrificed for that of a commoner, or the life of a commoner to expiate the death of a noble. This rule, as we shall see later on, is not suggested by revenge itself, but is due to the influence of other factors which intermingle with this feeling, and help, with it, to determine the action.

Nevertheless, the strong tendency to discrimination which characterises resentment, is not wholly lost even behind the veil of common responsibility. Mr. Howitt has come to the conclusion that, among the Australian Kurnai, if a homicide has been committed by an alien tribe, the feud "cannot be satisfied but by the death of the offender," although it is carried on, not against him alone, but against the whole group of which he is a member.[71] It is only "if they fail to secure the guilty person" that the natives of Western Victoria consider it their duty to kill one of his nearest relatives.[72] Concerning the West Australian aborigines, Sir George Grey

observes, "The first great principle with regard to punishments is, that all the relations of a culprit, in the event of his not being found, are implicated in his guilt; if, therefore, the principal cannot be caught, his brother or father will answer nearly as well, and failing these, any other male or female relative, who may fall into the hands of the avenging party."[73] Among the Papuans of the Tami Islands, revenge may be taken on some other member of the murderer's family only if it is absolutely impossible to catch the guilty person himself.[74] That the blood-revenge is in the first place directed against the malefactor, and against some relative of his only if he cannot be found out, is expressly stated with reference to various peoples in different parts of the world;[75] and it is {36} probable that much more to the same effect might have been discovered, if the observers of savage life had paid more attention to this particular aspect of the matter. Among the Fuegians, the most serious riots take place when a manslayer, whom some one wishes to punish, takes refuge with his relations or friends.[76] Von Martius remarks of the Brazilian Indians in general that, even when an intertribal war ensues from the committing of homicide, the nearest relations of the killed person endeavour, if possible, to destroy the culprit himself and his family.[77] With reference to the Creek Indians, Mr. Hawkins says that though, if a murderer flies and cannot be caught, they will take revenge upon some innocent individual belonging to his family, they are "generally earnest of themselves, in their endeavours to put the guilty to death."[78] The same is decidedly the case in those parts of Morocco where the blood-feud still prevails.

Not only has Dr. Steinmetz failed to prove his hypothesis that revenge was originally "undirected," but this hypothesis is quite opposed to all the most probable ideas we can form with regard to the revenge of early man. For my own part I am convinced that we may obtain a good deal of knowledge about the primitive condition of the human race, but not by studying modern savages only. I have dealt with this question at some length in another place,[79] and wish now merely to point out that those general physical and psychical qualities which are not only common to all races of mankind, but which are shared by them with the animals most allied to man, may be assumed to have been present also in the earlier stages of {37} human development. Now, concerning revenge among animals, more especially among monkeys, many anecdotes have been told by trustworthy authorities, and in every case the revenge has been clearly directed against the offender.

[Footnote 79: _History of Human Marriage_, p. 3 _sqq._]

On the authority of a zoologist "whose scrupulous accuracy was known to many persons," Darwin relates the following story:--"At the Cape of Good Hope an officer had often plagued a certain baboon, and the animal, seeing him approaching one Sunday for parade, poured water into a hole and hastily made some thick mud, which he skilfully dashed over the officer as he passed by, to the amusement of many bystanders. For long afterwards the baboon rejoiced and triumphed whenever he saw his victim."[80] Prof. Romanes considers this to be a good instance of "what may be called brooding resentment deliberately preparing a satisfactory revenge."[81] This, I think, is to put into the statement somewhat more than it really contains; but at all events it records a case of revenge, in the sense in which Dr. Steinmetz uses the word. The same may be said of other instances mentioned by so accurate observers as Brehm and Rengger in their descriptions of African and American monkeys, and of various examples of resentment in

elephants and even in camels.[82] According to Palgrave, the camel possesses the passion of revenge, and in carrying it out "shows an unexpected degree of far-thoughted malice, united meanwhile with all the cold stupidity of his usual character." The following instance, which occurred in a small Arabian town, deserves to be quoted, since it seems to have escaped the notice of the students of animal psychology. "A lad of about fourteen had conducted a large camel, laden with wood, from that very village to another at half an hour's distance or so. As the {38} animal loitered or turned out of the way, its conductor struck it repeatedly, and harder than it seems to have thought he had a right to do. But not finding the occasion favourable for taking immediate quits, it 'bode its time'; nor was that time long in coming. A few days later the same lad had to re-conduct the beast, but unladen, to his own village. When they were about half way on the road, and at some distance from any habitation, the camel suddenly stopped, looked deliberately round in every direction, to assure itself that no one was within sight, and, finding the road far and near clear of passers-by, made a step forward, seized the unlucky boy's head in its monstrous mouth, and lifting him up in the air flung him down again on the earth with the upper part of his skull completely torn off, and his brains scattered on the ground."[83] We are also told that elephants, though very sensitive to insults, are never provoked, even under the most painful or distracting circumstances, to hurt those from whom they have received no harm.[84] Sometimes animals show a remarkable degree of discrimination in finding out the proper object for their resentment. It is hardly surprising to read that a baboon, which was molested in its cage with a stick, tried to seize, not the stick, but the hand of its tormentor.[85] More interesting is the "revenge" which an elephant at Versailles inflicted upon a certain artist who had employed his servant to tease the animal by making a feint of throwing apples into its mouth:--"This conduct enraged the elephant; and, as if it knew that the painter was the cause of this teasing impertinence, instead of attacking the servant, it eyed the master, and squirted at him from its trunk such a quantity of water as spoiled the paper on which he was drawing."[86]

[Footnote 82: Brehm, _Thierleben_, i. 156. _Idem_, _From North Pole to Equator_, p. 305. Rengger (_Naturgeschichte der Säugethiere von Paraguay_, p. 52) gives the following information about the Cay:--"Fürchtet er . . . seinen Gegner, so nimmt er seine Zuflucht zur Verstellung, und sucht sich erst dann an ihm zu rächen, wenn er ihn unvermuthet überfallen kann. So hatte ich einen Cay, welcher mehrere Personen die ihn oft auf eine grobe Art geneckt hatten, in einem Augenblicke lass, wo sie im besten Vernehmen mit ihm zu sein glaubten. Nach verübter That kletterte er schnell auf einen hohen Balken, wo man ihm nicht beikommen konnte, und grinste schadenfroh den Gegenstand seiner Rache an." [Footnote 86: Smellie, _Philosophy of Natural History_, i. 448.]

I find it inconceivable that anybody, in the face of such facts, could still believe that the revenge of early man was at first essentially indiscriminating, and became gradually discriminating from considerations of social expediency. But by this I certainly do not mean to deny that violation of the "self-feeling" is an extremely common and powerful incentive to resentment. It is so {39} among savage[87] and civilised men alike; even dogs and monkeys get angry when laughed at. Nothing more easily rouses in us anger and a desire for retaliation, nothing is more difficult to forgive, than an act which indicates contempt, or disregard of our feelings. Long after the bodily pain of a blow has ceased, the mental suffering caused by the insult remains and calls for vengeance. This is an old truth often told. According to Seneca, "the greater part of the things which enrage us are insults, not injuries."[88] Plutarch observes that, though different persons fall into anger for different reasons, yet in nearly all of them is to be found the idea of their being despised or neglected.[89] "Contempt," says Bacon, "is that which putteth an edge upon anger, as much, or more, than the hurt itself."[90] But, indeed, there is no need to resort to different principles in order to explain the resentment excited by different kinds of pain. In all cases revenge implies, primordially and essentially, a desire to cause pain or destruction in return for hurt suffered, whether the hurt be bodily or mental; and, if to this impulse is added a desire to enhance the wounded "self-feeling," that does not interfere with the true nature of the primary feeling of revenge. There are genuine specimens of resentment without the co-operation of self-regarding pride;[91] and, on the other hand, the reaction of the wounded "self-feeling" is not necessarily, in the

first place, concerned with the infliction of pain. If a person has written a bad book which is severely criticised, he may desire to repair his reputation by writing a better book, not by humiliating his critics; and if he attempts the latter rather than the former, he does so, not merely in order to enhance his "self-feeling," {40} but because he is driven on by revenge. Dr. Boas tells us that the British Columbia Indian, when his feelings are hurt, sits down or lies down sullenly for days without partaking of food, and that, "when he rises his first thought is, not how to take revenge, but to show that he is superior to his adversary.[92]

[Footnote 92: Boas, _First General Report on the Indians of British Columbia_, read at the Newcastle-upon-Tyne meeting of the British Association, 1889, p. 19.]

In the feeling of gratification which results from successful resentment, the pleasure of power or superiority also may form a very important element, but it is never the exclusive element.[93] As the satisfaction of every desire is accompanied by pleasure, so the satisfaction of the desire involved in resentment gives a pleasure by itself. The angry or revengeful man who succeeds in what he aims at, delights in the pain he inflicts for the very reason that he desired to inflict it.

[Footnote 93: _Cf._ Ribot, _op. cit._ p. 221 _sq._]

Revenge thus only forms a link in a chain of emotional phenomena, for which "non-moral resentment" may be used as a common name. In this long chain there is no missing link. Anger without any definite desire to cause suffering, anger with such a desire, more deliberate resentment--all these phenomena are so inseparably connected with each other that no one can say where one passes into another. Their common characteristic is that they are mental states marked by an aggressive attitude towards the cause of pain.

As to their origin, the evolutionist can hardly entertain a doubt. Resentment, like protective reflex action, out of which it has gradually developed, is a means of protection for the animal. Its intrinsic object is to remove a cause of pain, or, what is the same, a cause of danger. Two different attitudes may be taken by an animal towards another which has made it feel pain: it may either shun or attack its enemy. In the former case its action is prompted by fear, in the latter by anger, and it depends on the circumstances which of these emotions is the actual {41} determinant. Both of them are of supreme importance for the preservation of the species, and may consequently be regarded as elements in the animal's mental constitution which have been acquired by means of natural selection in the struggle for existence. We have already noted that, originally, the impulse of attacking the enemy could hardly have been guided by a representation of the enemy as suffering. But, as a successful attack is necessarily accompanied by such suffering, the desire to produce it naturally, with the increase of intelligence, entered as an important element in resentment. The need for protection thus lies at the foundation of resentment in all its forms.

This view is not new. More than one hundred and fifty years before Darwin, Shaftesbury wrote of resentment in these words:--"Notwithstanding its immediate aim be indeed the ill or punishment of another, yet it is plainly of the sort of those [affections] which tend to the advantage and interest of the self-system, the animal himself; and is withal in other respects contributing to the good and interest of the species."[94] A similar opinion is expressed by Butler, according to whom the reason and end for which man was made liable to anger is, that he might be better qualified to prevent and resist violence and opposition, while deliberate resentment "is to be considered as a weapon, put into our hands by nature, against injury, injustice, and cruelty."[95] Adam Smith, also, believes that resentment has "been given us by nature for defence, and for defence only," as being "the safeguard of justice and the security of innocence."[96] Exactly the same view is taken by several modern evolutionists as regards the "end" of resentment, though they, of course, do not rest contented with saying that this feeling has been given us by nature, but try to explain in what way it has developed. "Among members of the same species," says Mr. Herbert Spencer, "those individuals which have not, in any considerable degree, resented aggressions, must have ever tended to disappear, and to have

left behind those which have with some effect made counter-aggressions."[97] Mr. {42} Hiram Stanley, too, quoting Junker's statement regarding the pigmies of Africa, that "they are much feared for their revengeful spirit,"[98] observes that, "other things being equal, the most revengeful are the most successful in the struggle for self-conservation and self-furtherance."[99] This evolutionist theory of revenge has been criticised by Dr. Steinmetz, but in my opinion with no success. He remarks that the _feeling_ of revenge could not have been of any use to the animal, even though the _act_ of vengeance might have been useful.[100] But this way of reasoning, according to which the whole mental life would be excluded from the influence of natural selection, is based on a false conception of the relation between mind and body, and, ultimately, on a wrong idea of cause and effect.

[Footnote 94: Shaftesbury, 'Inquiry concerning Virtue or Merit,' ii. 2. 2, in _Characteristicks_, ii. 145.]

[Footnote 100: Steinmetz, _Ethnol. Studien, &c._ i. 135.]

From non-moral resentment we shall pass to the emotion of moral indignation. That this is closely connected with anger is indicated by language itself: we may feel indignant on other than moral grounds, and we may feel "righteous anger." The relationship between these emotions is also conspicuous in their outward expressions, which, when the emotion is strong enough, present similar characteristics. When possessed with strong moral indignation, a person looks as if he were angry,[101] and so he really is, in the wider sense of the term. This relationship has not seldom been recognised by moralists, though it has more often been forgotten. Some two thousand years ago Polybius wrote:--"If a man has been rescued or helped in an hour of danger, and, instead of showing gratitude to his preserver, seeks to do him harm, it is clearly probable that the rest will be displeased and offended with him when they know it, sympathising with their neighbour and imagining themselves in his case. Hence arises a notion in every breast of the meaning and theory of duty, which is in fact the beginning and end of justice."[102] Hartley regarded resentment and gratitude {43} as "intimately connected with the moral sense."[103] Adam Smith made the resentment of "the impartial spectator" a corner-stone of his theory of the moral sentiments.[104] Butler found the essential difference between sudden and deliberate anger to consist in this, that the "natural proper end" of the latter is "to remedy or prevent only that harm which implies, or is supposed to imply, injury or moral wrong."[105] And to Stuart Mill, the sentiment of justice, at least, appeared to be derived from "the animal desire to repel or retaliate a hurt or damage to oneself, or to those with whom one sympathises."[106]

[Footnote 101: Notice, for instance, Michelangelo's Moses.]

[Footnote 102: Polybius, _Historiae_, vi. 6.]

[Footnote 103: Hartley, _Observations on Man_, i. 520.]

[Footnote 104: Adam Smith, _op. cit._ _passim_.]

[Footnote 105: Butler, _op. cit._ p. 458.]

[Footnote 106: Stuart Mill, _Utilitarianism_, p. 79.]

Moral indignation, or disapproval, like non-moral resentment, is a reactionary attitude of mind directed towards the cause of inflicted pain. In a subsequent chapter we shall see that both are in a similar way determined by the answer given to the question, What is the cause of the pain?--a fact which, whilst strongly confirming their affinity, throws light upon some of the chief characteristics of the moral consciousness. Nay, moral indignation resembles non-moral resentment even in this respect that, in various cases, the aggressive reaction turns against innocent persons who did not commit the injury which gave rise to it. The collective responsibility assumed in certain types of blood-revenge is an evidence of this in so far as such revenge is not merely a matter of individual practice, but has the sanction of custom. And even punishment, which, in the strict sense of the term, is a more definite expression

of public, or moral, indignation than the custom of private retaliation, is often similarly indiscriminate.

Like revenge, and for similar reasons, punishment sometimes falls on a relative of the culprit in cases when he himself cannot be caught. In Fiji, says Mr. Williams, "the virtue of vicarious suffering is recognised." It once happened that a warrior left his charged musket so {44} carelessly that it went off and killed and wounded some individuals, whereupon he fled himself. His case was judged worthy of death by the chiefs of the tribe, and the offender's aged father was in consequence seized and strangled.[107]

[Footnote 107: Williams and Calvert, _Fiji_, p. 24.]

In other cases an innocent person is killed for the offence of another, not because the offender cannot be seized, but with a view to inflicting on him a loss, according to the rule of like for like. The punishment, then, is meant for the culprit, though the chief sufferer is somebody else. According to the Laws of [Hv]ammurabi, "if a builder has built a house for a man and has not made strong his work, and the house he built has fallen, and he has caused the death of the owner, that builder shall be put to death." But "if he has caused the son of the owner of the house to die, one shall put to death the son of that builder."[108] Similarly, "if a man has struck a gentleman's daughter and caused her to drop what is in her womb, he shall pay ten shekels of silver for what was in her womb." But "if that woman has died, one shall put to death his daughter."[109] The following custom which Mr. Gason reports, as existing among the Australian Dieyerie, in case a man should unintentionally kill another in a fight, is probably based on a similar principle:--"Should the offender have an elder brother, then he must die in his place; or, should he have no elder brother, then his father must be his substitute; but in case he has no male relative to suffer for him, then he himself must die."[110]

[Footnote 108: _Laws of [Hv]ammurabi_, 229 _sq._]

[Footnote 109: _Ibid._ 209 _sq._]

[Footnote 110: Gason, 'Manners and Customs of the Dieyerie Tribe,' in Woods, _Native Tribes of South Australia_, p. 265.]

This extreme disregard of the suffering of guiltless persons is probably not so much due to downright callousness as to a strong feeling of family solidarity. The same feeling is very obvious in those numerous instances in which both the criminal himself and members of his family are implicated in the punishment.

{45} Among the Atkha Aleuts, the punishment for certain offences was sometimes carried so far as to include the wife of the offender.[111] Among the E[(w]e-speaking peoples of the Slave Coast, "a person found guilty of having procured, or endeavoured to procure, the death of another through the agency of the gods Huntin and Loko, is put to death, and his family is generally enslaved as well."[112] Among the Matabele, if a person is declared by the witch-doctor to have caused injury to somebody else by making charms, he "is immediately put to death, his wife and the whole of his family sharing his fate."[113] Among the Shilluks of the White Nile, "murder is punished with death to the criminal and the forfeiture of wives and children to the Sultan, who retains them in bondage."[114] Among the Kafirs, in cases of trespasses against the king, the sentence falls not only on the individual, but on his whole house.[115] In Madagascar, the code of native laws, up to recent time, reduced for many offences the culprit's wife and children to slavery.[116] In some parts of the Malay Archipelago, according to Crawfurd, a father and child are considered almost inseparable, hence when the one is punished the other seldom escapes.[117] In Bali, the law prescribes that for certain kinds of sorcery the offender shall be put to death. It adds, "If the matter be very clearly made out, let the punishment of death be extended to his father and his mother, to his children and to his grand-children; let none of them live; let none connected with one so guilty remain on the face of the land, and let their goods be in like manner confiscated."[118]

[Footnote 118: _Ibid._ iii. 138.]

The Chinese doctrine of responsibility is to a great extent based upon family solidarity; in great crimes all the male relatives of the offender are held responsible for his deed. Every male relative, of whatever degree, who may be dwelling under the roof of a man guilty of treason, is doomed to death, with the exception of young boys, who are allowed their lives, but on the condition that they are made eunuchs for service in the imperial palace.[119] In ancient Mexico, traitors and conspirators were not only themselves killed, but their children and relatives {46} were made slaves to the fourth generation.[120] According to an Athenian law, a man who committed sacrilege or betrayed his country was banished with all his children.[121] Aristotle mentions a case of sacrilege in which "the bones of the guilty dead were disentombed and cast beyond the borders of Attica; the living clan were condemned to perpetual exile, and the city was subsequently purified."[122] The Macedonian law involved in punishment the kindred of conspirators against the monarch.[123] Dionysius of Halicarnassus states that some of the Greeks "think it reasonable to put to death the sons of tyrants together with their fathers, whereas others punish them with perpetual banishment"; and he contrasts this with the Roman principle that "the sons shall be exempted from all punishment, whose fathers are offenders, whether they happen to be the sons of tyrants, of parricides, or of traitors."[124] But after the end of the Marsic, and civil wars, this rule was transgressed;[125] and later on Arcadius, though expressly ordaining that the punishment of the crime shall extend to the criminal alone,[126] took a different view of the punishment for treason. By a special extension of his imperial clemency, he allows the sons of the criminal to live, although in strict justice, being tainted with hereditary guilt, they ought to suffer the punishment of their father. But they shall be incapable of inheritance; they shall be abandoned to the extreme of poverty and perpetual indigence; they shall be excluded from all honours and from the participation of religious rites; the infamy of their father shall ever attend them, and such shall be the misery of their condition, that life shall be a punishment and death a comfort.[127] Among the Anglo-Saxons, before the time of Cnut, the child, even the infant in the cradle, was liable to be sold into slavery for the payment of penalties incurred by the father, being "held by the covetous to be equally guilty as if it had discretion."[128] Even later, the child of an outlaw, following the condition of the father, also became an outlaw; and this grievance was only partly remedied by Edward the Confessor, who relieved from the consequences of the father's outlawry such children as were born before he was {47} outlawed, but not such as were born afterwards.[129] During the Middle Ages it was the invariable rule to confiscate the entire property of an impenitent heretic, a rule which was justified on the ground that his crime is so great that something of his impurity falls upon all related to him.[130] The Pope Alexander IV. also excluded the descendants of an heretic to the second generation from all offices in the Church.[131] Owing to religious influence, illegitimate children were not only deprived of the title to inheritance, but they were treated by some law-books as almost rightless beings, on a par with robbers and thieves.[132] If a person committed suicide, his goods were confiscated, and, according to a French mediæval law, his wife was besides deprived of her own private property.[133] Even in the latter half of the eighteenth century, in France, in the case of an attempt made against the life of the king, the whole family of the criminal was banished.[134] Nay, in various European countries, up to quite recent times--in England till 1870--forfeiture of property has been the punishment prescribed for certain crimes, including suicide;[135] which means, if not actually the imposition of penalties on the survivors in a case where the culprit himself is out of reach, at least a gross disregard of their ordinary rights of property. It is hardly necessary to point out how often, in the very society in which we live, "social punishments" are inflicted upon children for their father's wrongs.

For the explanation of these facts we have to remember what has been said before about collective responsibility in the case of revenge. Speaking of the Chinese doctrine of family solidarity, Dr. de Groot observes that, "under the influence of this doctrine, families, not men individually, came to be regarded, from the Government's point of view, as the smallest particles, the molecules of the nation, each individual being swallowed up in the circle of his kinsfolk."[136] Such a doctrine assumes that the other members of the family-group are, in a way, accessories {48} to any crime committed by a fellow-member. "Human nature," says Lord Kames, "is not so perverse, as without veil or disguise to punish a person acknowledged to be innocent. An irregular bias of imagination, which extends the qualities of the principal to its accessories, paves the way to that unjust practice. This bias, strengthened by indignation against an atrocious criminal, leads the mind hastily to conclude, that all his connections are partakers of his guilt."[137] Among the ancients we also meet with a strong belief that, according to the course of nature, wicked fathers have wicked sons. "That which is begot," says Plutarch, "is not, like some production of art unlike the begetter, for it proceeds from him, and is not merely produced by him, so that it appropriately receives his share, whether that be honour or punishment."[138] To destroy, or to make harmless, the family of an offender may be, not only an act of retaliation, but a precaution; according to an old Greek adage, "a man is a fool if he kills the father and leaves the sons alive."[139] This especially holds good for treason, which generally suggests accomplices; and of all crimes for which penalties are imposed upon other individuals besides the culprit, treason is probably the most common. This crime is also particularly apt to evoke the hatred of those who have the power to punish, hence the punishment of it, being closely allied to an act of revenge, is often inflicted without due discrimination. Moreover, by being extended to the criminal's family, the punishment falls more heavily upon himself as well. Again, in case the crime is of a sacrilegious character, it is supposed to pollute everybody connected with the criminal, and even the whole community where he dwells.

[Footnote 139: Schmidt, _Ethik der alten Griechen_, ii. 126.]

In their administration of justice, gods are still more indiscriminate than men. They hold the individual responsible for the whole to which he belongs. They {49} punish the community for the sins of one of its members. They visit the iniquity of the fathers and forefathers upon the children and descendants.

The Sibuyaus, a tribe belonging to the Sea Dyaks, "are of opinion that an unmarried girl proving with child must be offensive to the superior powers, who, instead of always chastising the individual, punish the tribe by misfortunes happening to its members. They, therefore, on the discovery of the pregnancy fine the lovers, and sacrifice a pig to propitiate offended Heaven, and to avert that sickness or those misfortunes that might otherwise follow; and they inflict heavy mulcts for every one who may have suffered from any severe accident, or who may have been drowned within a month before the religious atonement was made."[140] According to Chinese beliefs, whole kingdoms are punished for the conduct of their rulers by spirits who act as avengers with orders or approval from the _Tao_, or Heaven.[141] Prevalent opinion in China, continuously inspired anew by literature of all times and ages, further admits that spiritual vengeance may come down upon the culprit's offspring in the form of disease or death.[142] When a maimed or deformed child is born the Japanese say that its parents or ancestors must have committed some great sin.[143] The Vedic people ask Varuna to forgive the wrongs committed by their fathers.[144] Says the poet:--"What we ourselves have sinned in mercy

pardon; my own misdeeds do thou, O god, take from me, and for another's sin let me not suffer."[145] According to the ancient Greek theory of divine retribution, the community has to suffer for the sins of some of its members, children for the sins of their fathers.[146] Hesiod says that often a whole town is punished with famine, pestilence, barrenness of its women, or loss of its army or vessels for the misdeeds of a single individual.[147] Cr[oe]sus atoned by the forfeiture of his kingdom for the crime of Gyges, his fifth ancestor, who had murdered his master and usurped his throne.[148] Cytissorus brought down the anger of gods upon his descendants by {50} rescuing Athamas, whom the Achaians intended to offer up as an expiatory sacrifice on behalf of their country.[149] When hearing of the death of his wife, Theseus exclaims, "This must be a heaven-sent calamity in consequence of the sins of an ancestor, which from some remote source I am bringing on myself."[150] According to Hebrew notions, sin affects the nation through the individual and entails guilt on succeeding generations.[151] The anger of the Lord is kindled against the children of Israel on account of Achan's sin.[152] The sin of the sons of Eli is visited on his whole house from generation to generation.[153] Because Saul has slain the Gibeonites, the Lord sends, in the days of David, a three years' famine, which ceases only when seven of Saul's sons are hanged.[154] The sins of Manasseh are expiated even by the better generation under Josiah.[155] The notion of a jealous God who visits the iniquity of the fathers upon the children unto the third and fourth generation of them that hate Him,[156] is also frequently met with in the Old Testament Apocrypha. "The inheritance of sinners' children shall perish, and their posterity shall have a perpetual reproach."[157] "The seed of an unrighteous bed shall be rooted out."[158] The same idea has survived among Christian peoples. It was referred to in Canon Law as a principle to be imitated by human justice,[159] and by Innocent III. in justification of a bull which authorised the confiscation of the goods of heretics.[160] Up to quite recent times it was a common belief in Scotland that the punishment of the cruelty, oppression, or misconduct of an individual descended as a curse on his children to the third and fourth generation. It was not confined to the common people; "all ranks were influenced by it; and many believed that if the curse did not fall upon the first or second generation it would inevitably descend upon the succeeding."[161] In the dogma that the whole human race is condemned on {51} account of the sin of its first parents, the doctrine of collective responsibility has reached its pitch.

[Footnote 161: Stewart, _Sketches of the Character, &c., of the Highlanders of Scotland_, p. 127.]

Men originally attribute to their gods mental qualities similar to their own, and imagine them to be no less fierce and vindictive than they are themselves. Thus the retribution of a god is, in many cases, nothing but an outburst of sudden anger, or an act of private revenge, and as such particularly liable to comprise, not only the offender himself, but those connected with him. Plutarch even argued that the punishments inflicted by gods on cities for ill-deeds committed by their former inhabitants allowed of a just defence, on the ground that a city is "one continuous entity, a sort of creature that never changes from age, or becomes different by time, but is ever sympathetic with and conformable to itself," and therefore "answerable for whatever it does or has done for the public weal, as long as the community by its union and federal bonds preserves its unity."[162] He further observes that a bad man is not bad only when he breaks out into crime, but has the seeds of vice in his nature, and that the deity, knowing the nature and disposition of every man, prefers stifling crime in embryo to waiting till it becomes ripe.[163]

[Footnote 162: Plutarch, _De sera numinis vindicta_, 15.]

[Footnote 163: _Ibid._ 20.]

But there are yet special reasons for extending the retribution of a god beyond the limits of individual guilt. Whilst the resentment of a man is a matter of experience, that of a god is a matter of inference. That some particular case of suffering is a divine punishment, is inferred either from its own peculiar character, suggesting the direct interference of a god, or from the assumption that a certain act, on account of its offensiveness, cannot be left unpunished. Now experience shows that, in many instances, the sinner himself escapes all punishment, leading a happy life till his death; hence the conclusion is near at hand that any grave misfortune which befalls his descendants, is the delayed retribution of the offended {52} god.[164] Such a conclusion is quite in harmony with the common notions of divine power. It especially forces itself upon a mind which has no idea of a hell with _post mortem_ punishments for the wicked. And, where the spirit of a man after his death is believed to be still ardently concerned for the welfare of his family,[165] the affliction of his descendants naturally appears as a punishment inflicted upon himself. As Dr. de Groot observes, the doctrine of the Chinese, that spiritual vengeance may descend on the offender's offspring, tallies perfectly with their conception "that the severest punishment which may be inflicted on one, both in his present life and the next, is decline or extermination of his male issue, leaving nobody to support him in his old age, nobody to protect him after his death from misery and hunger by caring for his corpse and grave, and sacrificing to his manes."[166]

[Footnote 164: _Cf._ Isocrates, _Oratio de pace_, 120; Cicero, _De natura Deorum_, iii. 38; Nägelsbach, _op. cit._ p. 33 _sq._]

[Footnote 165: _Cf._ Schmidt, _op. cit._ i. 71 _sq._ (ancient Greeks).]

[Footnote 166: de Groot, _op. cit._ (vol. iv. book) ii. 452.]

The retributive sufferings which innocent persons have to undergo in consequence of the sins of the guilty, are not always supposed to be inflicted upon them directly, as a result of divine resentment. They are often attributed to infection. Sin is looked upon in the light of a contagious matter which may be transmitted from parents to children, or be communicated by contact.

This idea is well illustrated by the funeral ceremonies of the Tahitians. "When the house for the dead had been erected, and the corpse placed upon the platform or bier, the priest ordered a hole to be dug in the earth or floor near the foot of the platform. Over this he prayed to the god by whom it was supposed the spirit of the deceased had been required. The purport of his prayer was that all the dead man's sins, and especially that for which his soul had been called to the _po_, might be deposited there, that they might not attach in any degree to the survivors, and that the anger of the god might be appeased." All who were employed in embalming the dead were also, during the process, carefully avoided by every person, {53} as the guilt of the crime for which the deceased had died was believed to contaminate such as came in contact with the corpse; and as soon as the ceremony of depositing the sins in the hole was over, all who had touched the body or the garments of the deceased, which were buried or destroyed, fled precipitately into the sea to cleanse themselves from the pollution.[167] In one part of New Zealand "a service was

performed over an individual, by which all the sins of the tribe were supposed to be transferred to him, a fern stalk was previously tied to his person, with which he jumped into the river and there unbinding, allowed it to float away to the sea, bearing their sins with it."[168] The Iroquois White Dog Feast, which was held every year in January, February, or early in March,[169] implied, according to most authorities, a ceremony of sin-transference.[170] The following description of it is given by Mrs. Jemison, a white woman who was captured by the Indians in the year 1755:--Two white dogs, without spot or blemish, are strangled and hung near the door of the council-house. On the fourth or fifth day the "committee," consisting of from ten to twenty active men who have been appointed to superintend the festivities, "collect the evil spirit, or drive it off entirely, for the present, and also concentrate within themselves all the sins of their tribe, however numerous or heinous. On the eighth or ninth day, the committee having received all the sin, as before observed, into their own bodies, they take down the dogs, and after having transfused the whole of it into one of their own number, he, by a peculiar sleight of hand, or kind of magic, works it all out of himself into the dogs. The dogs, thus loaded with all the sins of the people, are placed upon a pile of wood that is directly set on fire. Here they are burnt, together with the sins with which they were loaded."[171] Among the Badágas of India, at a burial, "an elder, standing by the corpse, offers up a prayer that the dead may not go to hell, that the sins committed on earth may be forgiven, and that the sins may be borne by a calf, which is let loose in the jungle and used thenceforth for no manner of work."[172] At Utch-Kurgan, in Turkestan, Mr. Schuyler saw an old man, constantly {54} engaged in prayer, who was said to be an _iskatchi_, that is, "a person who gets his living by taking on himself the sins of the dead, and thenceforth devoting his life to prayer for their souls."[173]

[Footnote 173: Schuyler, _Turkistan_, ii. 28.]

In ancient Peru, an Inca, after confession of guilt, bathed in a neighbouring river, and repeated this formula:--"O thou River, receive the sins I have this day confessed unto the Sun, carry them down to the sea, and let them never more appear."[174] According to Vedic beliefs, sin is a contamination which may be inherited, or contracted in various ways,[175] and of which the sinner tries to rid himself by transferring it to some enemy,[176] or by invoking the gods of water or fire.[177] It is washed out by Varuna, in his capacity of a water-god,[178] and by Trita, another water-god,[179] and even by "the Waters" in general, as appears from the prayer addressed to them:--"O Waters, carry off whatever sin is in me and untruth."[180] For a similar reason, as it seems, water became in the later, Brahmanic age, the "essence (sap) of immortality"[181] and the belief in its purifying power still survives in modern India. No sin is too heinous to be removed, no character too black to be washed clean, by the waters of Ganges.[182] At sacred places of pilgrimage on the banks of rivers, the Hindus perform special religious shavings for the purpose of purifying soul and body from pollution; and persons who have committed great crimes or are troubled by uneasy consciences, travel hundreds of miles to such holy places where "they may be released from every sin by first being relieved of every hair and then plunging into the sacred stream."[183] So, also, according to Hindu beliefs, contact with cows purifies, and, as in the Parsi ritual, the dung and urine of cows have the power of preventing or cleansing away not only material, but moral defilements.[184] In post-Homeric Greece, individuals and a whole people were cleansed from their sins by water or some other material means of purification.[185] Plutarch, after observing {55} that "there are other properties that have connection and communication, and that transfer themselves from one thing to another with incredible quickness and over immense distances," asks whether it is "more wonderful that Athens should have been smitten with a plague which started in Arabia, than that, when the Delphians and Sybarites became wicked, vengeance should have fallen on their descendants."[186] The Hebrews annually laid the sins of the people upon the head of a goat, and sent it away into the wilderness;[187] and they cleansed every impurity with consecrated water or the sprinkling of blood.[188] To this day, the Jews in Morocco, on their New-Year's day, go to the sea-shore, or to some spring, and remove their sins by throwing stones into the water. The words of the Psalmist, "wash me thoroughly from mine iniquity, and cleanse me from my sin,"[189] were

not altogether a figure of speech; nor is Christian baptism originally a mere symbol. Its result is forgiveness of sins;[190] by the water, as a medium of the Holy Ghost, "the stains of sin are washed away."[191] That sin is contagious has been expressly stated by Christian writers. Novatian says that "the one is defiled by the sin of the other, and the idolatry of the transgressor passes over to him who does not transgress."[192]

[Footnote 192: Quoted by Harnack, _op. cit._ ii. 119.]

In this materialistic conception of sin there is an obvious confusion between cause and effect, between the sin and its punishment. Sin is looked upon as a substance charged with injurious energy, which will sooner or later discharge itself to the discomfort or destruction of anybody who is infected with it. The sick Chinese says of his disease, "it is my sin," instead of saying, "it is the punishment of my sin."[193] Both in Hebrew and in the Vedic language the word for sin is used in a similar way.[194] "In the consciousness of the pious Israelite," Professor Schultz observes, "sin, guilt, and punishment, are ideas so directly connected that the words for them are interchangeable."[195] {56} The prophets frequently and emphatically declare that there is in sin itself a power which must destroy the sinner.[196] So, too, as M. Bergaigne points out, there is in the Vedic notion of sin, "la croyance à une sorte de vertu propre du péché, grâce à laquelle il produit de lui-même son effet nécessaire, à savoir le châtiment du pécheur."[197] Sins are thus treated like diseases, or the germs of diseases, of which patients likewise try to rid themselves by washing or burning, or which are described in the very language often applied to sins as fetters which hold them chained.[198] All kinds of evil are in this way materialised. The Shamanistic peoples of Siberia, says Georgi, "hold evil to be a self-existing substance which they call by an infinitude of particular names."[199] According to Moorish ideas, _l-bas_, or "misfortune," is a kind of infection, which may be contracted by contact and removed by water or fire; hence in all parts of Morocco water- and fire-ceremonies are performed annually, either on the _(]âshur_-eve or at midsummer, _l-[(]an[s.]ara_, for the purpose of purifying men, animals, and fruit-trees.[200] And just as the Moors, on these {57} occasions, rid themselves of _l-bas_, so, in modern Greece, the women make

a fire on Midsummer Eve, and jump over it, crying, "I leave my sins."[201]

[Footnote 198: Oldenberg, _op. cit._ p. 288.]

[Footnote 199: Georgi, _Russia_, iii. 257.]

[Footnote 200: The various methods of transferring or expelling evil, which abundantly illustrate the materialistic notions held about it, have been treated by Dr. Frazer with unrivalled learning (_The Golden Bough_), iii. 1 _sqq._ I have little doubt that the fire- and water-ceremonies, once practised all over Europe on a certain day every year, belong to the same group of rites. "The best general explanation of these European fire-festivals," says Dr. Frazer (_ibid._ iii. 300), "seems to be the one given by Mannhardt, namely, that they are sun-charms or magical ceremonies intended to ensure a proper supply of sunshine for men, animals, and plants." But it should be noticed that in Europe, as in Morocco, a purificatory purpose is expressly ascribed to them by the very persons by whom they are practised (see Frazer, _op. cit._ iii. 238 _sqq._), that they alternate with lustration by water (see Grimm, _Teutonic Mythology_, ii. 588 _sqq._). On the other hand, in Dr. Frazer's exhaustive description of these ceremonies I fail to discover a single fact which would make Mannhardt's hypothesis at all probable. Dr. Frazer says (_op. cit._ iii. 301), "The custom of rolling a burning wheel down a hillside, which is often observed at these times, seems a very natural imitation of the sun's course in the sky." To me it appears as a method of distributing the purificatory energy over the fields or vineyards. Notice, for instance, the following statements:--In the Rhon Mountains, Bavaria, "a wheel wrapt in combustibles, was kindled and rolled down the hill; and the young people rushed about the fields with their burning torches and brooms. . . . In neighbouring villages of Hesse . . . it is thought that wherever the burning wheels roll, the fields will be safe from hail and storm" (_ibid._ iii. 243 _sq._). At Volkmarsen, in Hesse, "in some places tar-barrels or wheels wrapt in straw used to be set on fire, and then sent rolling down the hillside. In others the boys light torches and whisps of straw at the bonfires and rush about brandishing them in their hands" (_ibid._ iii. 254). In Münsterland, "boys with blazing bundles of straw run over the fields to make them fruitful" (_ibid._ iii. 255). Dr. Frazer says (_ibid._ iii. 301), "The custom of throwing blazing discs, shaped liked suns, into the air is probably also a piece of imitative magic." But why should it not, in conformity with other practices, be regarded as a means of purifying the air? According to old writers, the object of Midsummer fires was to disperse the aerial dragons (_ibid._ iii. 267). It would carry me too far from my subject to enter into further details. I have dealt with the matter in my article 'Midsummer Customs in Morocco.' in _Folk-Lore_, xvi. 27-47.]

[Footnote 201: Grimm, _Teutonic Mythology_, ii. 623.]

Closely connected with the primitive conception of sin, is that of a curse. In fact, the injurious energy attributed to a sinful act, is in many cases obviously due to the curse of a god. The curse is looked upon as a baneful substance, as a miasma which injures or destroys anybody to whom it cleaves. The curse of Moses was said to lie on mount Ebal, ready to descend with punishments whenever there was an occasion for it.[202] The Arabs, when being cursed, sometimes lay themselves down on the ground so that the curse, instead of hitting them, may fly over their bodies.[203] According to Teutonic notions, curses alight, settle, cling, they take flight, and turn home as birds to their nests.[204] It is the vulgar opinion in Ireland "that a curse once uttered must alight on something: it will float in the air seven years, and may descend any moment on the party it was aimed at; if his guardian angel but forsake him, it takes forthwith the shape of some misfortune, sickness or temptation, and strikes his devoted head."[205] We shall later on see that curses are communicated through material media. In some parts of Morocco, if a man is not powerful enough to avenge an infringement on his marriage-bed, he leaves seven tufts of hair on his head and goes to another tribe to ask for help. This is _l-[(]âr_, a conditional curse, which is first seated in the tufts, and {58} from there transferred to those whom he invokes. Similarly, a person under the vow of blood-revenge lets his hair grow until he has fulfilled his vow. The oath clings to his hair, and will fall upon his head if he violates it.[206]

[Footnote 206: The same practice prevailed among the ancient Arabs (Wellhausen, _op. cit._ p. 122), and some other cases are recorded by Dr. Frazer (_op. cit._ i. 370 _sq._). I cannot accept Wellhausen's explanation (_op. cit._ p. 124) that the hair is allowed to grow for the purpose of being sacrificed when the vow is fulfilled.]

Generally, a curse follows the course which is indicated by the curser. But it does not do so in every case, and it has a tendency to spread. In ancient India[207] and among the Arabs[208] and Hebrews,[209] there was a belief that a curse, especially if it was undeserved, might fall back on the head of him who uttered it. The same belief prevailed, or still prevails, among the Irish;[210] so, also, according to an English proverb, "curses, like chickens, come home to roost." According to Plato, the curse of a father or mother taints everything with which it comes in contact. Any one who is found guilty of assaulting a parent, shall be for ever banished from the city into the country, and shall abstain from the temples; and "if any freeman eat or drink, or have any other sort of intercourse with him, or only meeting him have voluntarily touched him, he shall not enter into any temple, nor into the agora, nor into the city, until he is purified; for he should consider that he has become tainted by a curse."[211] Plutarch asks whether Jupiter's priest was forbidden to swear for the reason that "the peril of perjury would reach in common to the whole commonwealth, if a wicked, godless, and forsworn person should have the charge and superintendence of the prayers, vows, and sacrifices made on behalf of the city."[212] The Romans believed that certain horrid imprecations had such power, that not only the object of them never escaped their influence, but that the person who used them also was sure {59} to be unhappy.[213] Among the Arinzes, an oath is reckoned a terrible thing:--"They do not suffer a person, who has been under the necessity of expurgating himself in so dreadful a manner, to remain among them: he is sent into exile."[214] According to Bedouin notions, a solemn oath should only be taken at a certain distance from the camp, "because the magical nature of the oath might prove pernicious to the general body of Arabs, were it to take place in their vicinity."[215] "To take an oath of any sort," says Burckhardt, "is always a matter of great concern among the Bedouins. It seems as if they attached to an oath consequences of a supernatural kind. . . . A Bedouin, even in defence of his own right, will seldom be persuaded to take a solemn oath before a kadhy, or before the tomb of a sheikh or saint, as they are sometimes required to do; and would rather forfeit a small sum than expose himself to the dreaded consequences of an oath."[216] Exactly the same holds good for the Moors. The conditional self-curse is supposed in some degree to pollute the swearer even though the condition referred to in the oath be only imaginary, in other words, though he do not perjure himself. This, I think, is the reason why, among the Berbers in the South of Morocco, persons who have been wrongly accused of a crime, sometimes entirely undress themselves in the sanctuary where they are going to swear. They believe that, if they do so, the saint will punish the accuser; and I conclude that at the bottom of this belief there is a vague idea that the absence of all clothes will prevent the oath from clinging to themselves. They say that it is bad not only to swear, but even to be present when an oath is taken by somebody else. And at Demnat, in the Great Atlas, I was told that when a person has made oath at a shrine, he avoids going back to his house the same way as he came, since otherwise, at least if he {60} has sworn false, his family as well as himself would have to suffer.

[Footnote 216: _Ibid._ p. 165.]

If a curse is infectious, it is naturally liable to contaminate those who derive their origin from the infected individual. The house of Glaucus was utterly extirpated from Sparta, in accordance with the words of the oracle, "There is a nameless son of the Oath-god who has neither hands nor feet; he pursues swiftly, until, having seized, he destroys the whole race, and all the house."[217] So, too, the Erinyes visited the sins of the fathers even on the children and grandchildren;[218] and the Erinyes were originally only personifications of curses.[219] It is said in the Ecclesiasticus:--"A man that useth much swearing shall be filled with iniquity, and the plague shall never depart from his house. . . . If he swear in vain, he shall not be innocent, but his house shall be full of calamities."[220] Casalis remarks of the Basutos, that "the dreadful consequences that the curse of Noah has had for Ham and his descendants appear quite natural to these people."[221] The Dharkâr and Majhwâr in Mirzapur, believe that a person who forswears himself will lose his property and his children;[222] but as we do not know the contents of the oath, it is possible that the destruction of the latter is not ascribed to mere contagion, but is expressly imprecated on them by the swearer.[223] Among the Rejangs of Sumatra, {61} "any accident that happens to a man, who has been known to take a false oath, or to his children or grandchildren, is carefully recorded in memory, and attributed to this sole cause."[224] Among the Karens the following story is told:--"Anciently there was a man who had ten children, and he cursed one of his brethren, who had done him no injury; but the curse did the man no harm, and he did not die. Then the curse returned to the man who sent it, and all his ten children died."[225] The Moors are fond of cursing each other's father or mother, or grandfather, or grandfather's father, such a curse being understood to involve their descendants as well. The Rev. R. Taylor says of the Maoris, "To bid you go and cook your father would be a great curse, but to tell a person to go and cook his great-grandfather would be far worse, because it included every individual who has sprung from him."[226]

[Footnote 222: Crooke, _Tribes and Castes of the North-Western Provinces and Oudh_, ii. 287; iii. 444. _Cf._ _ibid._ i. 132.]

[Footnote 223: Among these tribes it is usual to swear by "putting a bamboo on the head," or "touching a broad-sword, touching the feet of a Brâhman, holding a cow's tail, touching Ganges water." But among many of the other tribes described by Mr. Crooke, persons swear on the heads of their children (_ibid._ i. 11, 130, 172; ii. 96, 138, 339, 357; iii. 40, 113, 251, 262; iv. 35), or with a son or grandson in the arms (_ibid._ ii. 428), and in such cases the death of the child would naturally be expected to follow perjury as a direct result of it. Among the Kol, the usual form of an oath is, "May my children die if I lie" (_ibid._ iii. 313).]

[Footnote 224: Marsden, _History of Sumatra_, p. 240.]

[Footnote 225: Mason, in _Jour. Asiatic Soc. Bengal_, xxxvii. pt. ii. 137.]

[Footnote 226: Taylor, _Te Ika a Maui_, p. 208.]

Thus, from the conception that sins and curses are contagious it follows that an innocent person may have to suffer for the sin of another. His suffering does not necessarily relieve the sinner from punishment; sin, like an infectious disease, may spread without vacating the seat of infection. But, as we have seen, it may also be transferred, and sin-transference involves vicarious suffering. At the same time, this kind of vicarious suffering must not be confounded with vicarious expiatory sacrifice. As a general rule, the scapegoat is driven or cast away, not killed. The exceptions to this rule seem to be due to two different causes. On the one hand, the scapegoat may be chased to death, or perhaps be pushed over a precipice,[227] for the sake of ridding the community as {62} effectively as possible of the evils loaded on the victim. Thus the Bhotiyás of Juhár take a dog, make him drunk, "and having fed him with sweetmeats, lead him round the village and let him loose. They then chase and kill him with sticks and stones, and believe

that by so doing no disease or misfortune will visit the village during the year."[228] On the other hand, the transference of evil may be combined with a sacrifice. But of such a combination only a few instances are recorded, and most of them are ambiguous. Considering further that in these cases, or at least in the best known of them, the act of transference takes place _after_ the victim has been killed, it seems to me extremely probable that we have here to do with a fusion of two distinct rites into one, and that the victim is not offered up as a sacrifice in its capacity of a scapegoat, but, once sacrificed, has been made use of as a conductor for all the evils with which the people are beset.

[Footnote 227: According to the Mishna, the Hebrew scapegoat was not allowed to go free in the wilderness, but was killed by being pushed over a precipice (Robertson Smith, _Religion of the Semites_, p. 418). See also the ambiguous passage in Servius, _In Virgilii Aeneidos_, iii. 57.]

[Footnote 228: Atkinson, 'Notes on the History of Religion in the Himálaya of the N.W. Provinces,' in _Jour. Asiatic Soc. Bengal_, liii. pt. i. 62.]

In his list of scapegoats, Dr. Frazer refers to a case of human sacrifice witnessed by the Rev. J. C. Taylor at Onitsha, on the Niger.[229] A young woman was drawn, with her face to the earth, from the king's house to the river. As the people drew her along, they cried, "Wickedness! Wickedness!" so as to notify to the passers-by to screen themselves from witnessing the dismal scene. The sacrifice was to take away the iniquities of the land. The body was dragged along in a merciless manner "as if the weight of all their wickedness were thus carried away"; and it was finally drowned in the river. Our informant also heard that there was a man killed, as a sacrifice for the sins of the king. "Thus two human beings were offered as sacrifices, to propitiate their heathen deities, thinking that they would thus atone for the individual sins of those who had broken God's laws during the past year. . . . Those who had fallen into gross sins during the past year--such as incendiarisms, thefts, fornications, adulteries, witchcrafts, incests, slanders, &c.--were expected to pay in twenty-eight _ngugus_, or _£_2 0_s._ 7½_d._, as a fine; and this money was taken into the interior, to purchase two sickly persons, to be {63} offered as a sacrifice for all these abominable crimes--one for the land, and one for the river."[230] As will be seen in a following chapter, human sacrifices to rivers are very common in the Niger country. In the cases mentioned by the English missionary, the idea of vicarious expiation is obvious. But I find no evidence of actual sin-transference.

[Footnote 229: Frazer, _op. cit._ iii. 109 _sq._]

[Footnote 230: Crowther and Taylor, _Gospel on the Banks of the Niger_, p. 344 _sq._]

Dr. Frazer further mentions a custom which, according to Strabo, prevailed among the Albanians of the Eastern Caucasus.[231] In the temple of the Moon they kept a number of sacred slaves, of whom many were inspired and prophesied. When one of these men exhibited more than usual symptoms of inspiration or insanity, the high priest had him bound with a sacred chain and maintained him in luxury for a year. At the end of the year he was anointed with unguents and led forth to be sacrificed. A man thrust a sacred spear into his side, piercing his heart. From the manner in which the victim fell, omens were drawn as to the welfare of the commonwealth. Then the body was carried to a certain spot where all the people stood upon it as a purificatory ceremony.[232] Dr. Frazer maintains that "the last circumstance clearly indicates that the sins of the people were transferred to the victim, just as the Jewish priest transferred the sins of the people to the scapegoat by laying his hand on the animal's head."[233] So it may be, although, in my opinion, the purificatory ceremony described by Strabo also allows of another interpretation. The victim was evidently held to be saturated with magic energy; this is commonly the case with men, or animals, or even inanimate things, that are offered in sacrifice, and in the present instance the man was regarded as holy already, long before he was slain. To stand on the corpse, then, might have been regarded as purifying in consequence of the benign virtue inherent in it, just as, according to Muhammedan notions, contact with a saint cures disease, not by transferring it to the saint, but by annihilating it or expelling it from the body of the patient. But whether the ceremony in question involved the idea of sin-transference or not, there is no indication that the sacrifice of the slave was of an expiatory character. The same may be said both of the Egyptian sacrifice of a bull, mentioned by Herodotus, and of the white dog sacrifice performed by the Iroquois. The Egyptians first invoked the god and slew the bull. They then cut off his head and flayed the body. Next {64} they took the head, and heaped imprecations on it, praying that, if any evil was impending either over those who sacrificed or over the land of Egypt, it might be made to fall upon that head. And finally, they either sold the head to Greek traders or threw it into the river[234]--which shows that the real scapegoat, the head, was not regarded as a sacrifice to the god. Among the Iroquois, also, the victims were slain before the sins of the people were transferred to them. According to Hale's and Morgan's accounts of this rite, which have reference to different tribes of the Iroquois, no mention of sin-transference is made in the hymn which accompanied the sacrifice.[235] Only blessings were invoked. This was the beginning of the chant:--"Now we are about to offer this victim adorned for the sacrifice, in hope that the act will be pleasing and acceptable to

the All-Ruler, and that he will so adorn his children, the red men, with his blessings, when they appear before him."[236] Mr. Morgan even denies that the burning of the dog had the slightest connection with the sins of the people, and states that "in the religious system of the Iroquois, there is no recognition of the doctrine of atonement for sin, or of the absolution or forgiveness of sins."[237]

[Footnote 237: Morgan, _op. cit._ p. 216.]

I think we can see the reason why, in some cases, a sacrificial victim is used as scapegoat. The transference of sins or evils is not looked upon as a mere "natural" process, it can hardly be accomplished without the aid of mysterious, magic energy. Among the Berbers of Ait Zel[t.]n, in Southern Morocco, sick people used to visit a miracle-working wild olive-tree, growing in the immediate vicinity of the supposed grave of Sîdi Butlîla. They there relieve themselves of their complaints by tying a woollen string to one of its branches; in case of headache the patient previously winds the string three times round the top of his head, whilst, in case of fever, he spits on the string, and, when tying it to the tree, says, "I left my fever in thee, O wild olive-tree." He believes that he may thus transfer his disease to this tree because there is _baraka_, "benign virtue," in it; he would not expect to be cured {65} by tying the string to any ordinary tree. This illustrates a principle of probably world-wide application. In Morocco, and, I presume, in other countries where disease-transference is believed in, rags tied to a tree are a sure indication that the tree is regarded as holy. Similarly I venture to believe that the transference of sins and evils to a scapegoat is generally supposed to require magic aid of some kind or other. Among the Hebrews, it took place on the Day of Atonement only, and the act was performed by the high-priest.[238] Among the Iroquois, it was by "a kind of magic" that the sins of the people were worked into the white dogs;[239] and that the animals themselves were held to be charged with supernatural energy, appears from the fact that, according to one account, the ashes of the pyre on which one of them was burnt were "gathered up, carried through the village, and sprinkled at the door of every house."[240] Considering, then, that sacrificial victims, owing to their close contact with the deities to whom they are offered, are held more or less sacred, the idea of employing them as scapegoats is certainly near at hand. But this does not make the sacrifice expiatory. In fact, I know of no instance of an expiatory sacrifice being connected with a ceremony of sin-transference. Hence the materialistic conception of sin hardly helps to explain the belief that the sins of a person may be atoned by another person being offered as a sacrifice to the offended god.

[Footnote 238: _Leviticus_, xvi. 21.]

[Footnote 239: Seaver, _op. cit._ p. 160.]

[Footnote 240: Beauchamp, _loc. cit._ p. 239.]

A sacrifice is expiatory if its object is to avert the supposed anger or indignation of a superhuman being from those on whose behalf it is offered. In various cases the offended god is thought to be appeased only by the death of a man. But it is not always necessary that the victim should be the actual offender. The death of a substitute may expiate his guilt. The expiatory sacrifice may be vicarious.

We shall see, in a subsequent chapter, that, as a general {66} rule, human victims are sacrificed for the purpose of saving the lives of the sacrificers: before the beginning of a battle or during a siege, previously to a dangerous sea-expedition, during epidemics, famines, or on other similar occasions, when murderous designs are attributed to some superhuman being on whose will the lives of men are supposed to depend. But these sacrifices are not always expiatory in nature. A god may desire to cause the death of men not only because he is offended, but because he delights in human flesh, or because he wants human attendants, or--no one knows exactly why. It is impossible to find out in each particular case whether the sacrifice is meant to be an expiation or not; it is not certain that the sacrificers know it themselves. Yet in many instances there can be no doubt that its object is to serve as a

vicarious atonement.

In Eastern Central Africa, "if a freeman were to set fire to the grass or reeds beside a lake, and cause a great conflagration close to the chosen abode of the deity, he is liable to be offered up to the god that is thus annoyed," but if he be the owner of many slaves he can easily redeem himself by offering one of them in his place.[241] The Ojibways, it is said, were once visited with an epidemic, which they regarded as a divine punishment sent them on account of their wickedness; and when all other efforts failed, "it was decided that the most beautiful girl of the tribe should enter a canoe, push into the channel just above the Sault, and throw away her paddle."[242] In B[oe]otia, a drunken man having killed a priest of Dionysus Aegobolus, and a pestilence having broken out immediately after, the calamity was regarded as a judgment on the people for the sacrilege, and the oracle of Delphi ordered them to expiate it by sacrificing to the god a blooming boy.[243] In his work on the Jews, Philo of Byblus states that "it was the custom among the ancients in cases of great dangers, that the rulers of a city or a nation, in order to avert universal destruction, should give the dearest of their children to be killed as a ransom offered to avenging demons."[244] The idea that sins could be expiated by the death of one who {67} had not deserved it, was familiar to the Hebrews. It was said that "the death of the righteous makes atonement."[245] The passage in Isaiah liii. 12 was interpreted of Moses, who "poured out his soul unto death[246] and was numbered with the transgressors (the generation that died in the wilderness) and bare the sin of many "that he might atone for the sin of the golden calf.[247] Ezekiel suffered "that he might wipe out the transgressions of Israel."[248] And of the Maccabaean martyrs it is said, "Having become as it were a vicarious expiation for the sins of the nation, and through the blood of those godly men and their atoning death, divine providence saved Israel which had before been evil entreated."[249] In these cases, of course, there was no sacrifice in the proper sense of the term, but they obviously illustrate the same characteristic of the divine mind. In fact, the death of Christ, by which he atoned and obliterated the sins of all ages, was conceived as a sacrifice, or spoken of in sacrificial figures.[250]

[Footnote 250: See Moore, _loc. cit._ col. 4229 _sqq._]

It is said that, according to early ideas, "it did not essentially concern divine justice that the punishment of faults committed should fall precisely on the guilty; what did concern it was that it should fall on some one, that it should have its accomplishment."[251] Men, we are told, could not fail to discern that a transgression produces suffering as its consequence, and, seeing this, they "associate suffering with the expiation of sin, and, in atoning for their transgressions, they mark their contrition by the suffering which they inflict vicariously on the victim. They argue thus: 'I have broken a law of God. God exacts pain as a consequence of such a breach. I will therefore slay this lamb, and its sufferings shall make the atonement requisite.'"[252] But, so far as I can see, this interpretation of the idea of vicarious expiation is not supported by facts. The victim whose suffering or death is calculated to appease the wrathful god is not anybody {68} at random, whosoever he may be. He is a representative of the community which has incurred the anger of the god, and is accepted as a substitute on the principle of social solidarity. So, also, according to the Western Church, Christ discharged the punishment due to the sins of mankind and propitiated the justice of his Father, in his capacity of a man, as a representative of the human race; whereas in the East, where it was maintained that the _deity_ suffered (though he suffered through the human nature which he had made his own), the idea of substitution could hardly take root, since, as Harnack remarks, "the dying _God_-man really represented no one."[253] The Greek Church regarded the death of Christ as a ransom for mankind paid to the devil, and this doctrine was also accepted by the most important of the Western Fathers, although it flatly contradicted their own theory of atonement.[254] There can be no doubt that expiatory sacrifices are frequently offered as ransoms,

in other words, that the god or demon is supposed to be appeased, not by the suffering of the victim, but by the gift. Among men it often occurs that the offended party is induced by some material compensation to desist from avenging the injury--in many societies such placability is even prescribed by custom,--and something similar is naturally believed to be the case with gods. From this point of view, of course, it is not necessary that the victim should be a person who is connected with the offender by ties of social solidarity, although he may still be regarded as in a way a substitute. He may be an alien or a slave; or animals or inanimate things may be offered to expiate the sins of men. Among the Dacotahs, "for the expiation of sins or crimes a sacrifice is made of some kind of an animal."[255] Of the Melanesian sacrifices, says Dr. Codrington, "some are propitiatory, substituting an animal for the person who has offended."[256] The Shánárs of Tinnevelly offer up a {69} goat, a sheep, or a fowl, in order "to appease the angry demon, and induce him to remove the evil he has inflicted, or abstain from the infliction he may meditate."[257] It would be almost absurd to suppose that in similar cases the suffering or death of the animal is looked upon in the light of a vicarious _punishment_. Of the Hebrew sin-offering, Professor Kuenen aptly remarks:--[258]"According to the Israelite's notion, Yahveh in his clemency permits the soul of the animal sacrificed to take the place of that of the sacrificer. No transfer of guilt to the animal sacrificed takes place: the blood of the latter is clean and remains so, as is evident from the very fact that this blood is put upon the altar; it is a token of mercy on Yahveh's part that he accepts it. . . . Nor can it be asserted that the animal sacrificed undergoes the punishment in the place of the transgressor: this is said nowhere, and therefore, in any case, gives another, more sharply defined idea than that which the Israelite must have formed for himself; moreover, it is irreconcilable with the rule that the indigent may bring the tenth part of an ephah of fine flour as a sin-offering."[259] It should also be noticed that a purifying effect was ascribed to contact with the victim's blood: the high priest should put or sprinkle some blood upon the altar "and cleanse it, and hallow it from the uncleanness of the children of Israel."[260]

[Footnote 260: _Ibid._ xvi. 18 _sq._]

To sum up:--The fact that punishments for offences are frequently inflicted, or are supposed to be inflicted, by men or gods upon individuals who have not committed those offences, is explicable from circumstances which in no way clash with our thesis that moral indignation is, in its essence, directed towards the assumed cause of inflicted pain. In many cases the victim, in accordance with the doctrine of collective responsibility, is punished because he is considered to be involved in the guilt--even when he is really innocent--or because he is regarded as a fair {70} representative of an offending community. In other cases, he is supposed to be polluted by a sin or a curse, owing to the contagious nature of sins and curses. The principle of social solidarity also accounts for the efficacy ascribed to vicarious expiatory sacrifices; but in many instances expiatory sacrifices only have the character of a ransom or bribe.

And whilst thus our thesis as to the true direction of moral indignation is not in the least invalidated by facts, apparently, but only apparently, contradictory, it is, on the other hand, strongly supported by the protest which the moral consciousness, when sufficiently guided by discrimination and sympathy, enters against the infliction of penal suffering upon the guiltless. Such a protest is heard from various quarters, both with reference to human justice and with reference to the resentment of gods.

Confucius taught that the vices of a father should not discredit a virtuous son.[261] Plato lays down the rule that "the disgrace and punishment of the father is not to be visited on the children"; on the contrary, he says, if the children of a criminal who has been punished capitally avoid the wrongs of their father, they shall have glory, and honourable mention shall be made of them, "as

having nobly and manfully escaped out of evil into good."[262] According to Roman law, "crimen vel poena paterna nullam maculam filio infligere potest."[263] "Nothing," says Seneca, "is more unjust than that any one should inherit the quarrels of his father."[264] The Deuteronomist enjoins, "The fathers shall not be put to death for the children, neither shall the children be put to death for the fathers: every man shall be put to death for his own {71} sin."[265] Lawgivers have been anxious to restrict the blood-feud to the actual culprit. The Koran forbids the avenger of blood to kill any other person than the manslayer himself.[266] In England, according to a law of Edmund, the feud was not to be prosecuted against the kindred of the slayer, unless they made his misdeed their own by harbouring him.[267] So, also, in Sweden, in the thirteenth century, the blood feud was limited by law to the guilty individual;[268] and we meet with a similar restriction in Slavonic law-books.[269]

[Footnote 262: Plato, _Leges_, ix. 854 _sqq._ Plato makes an exception for those whose fathers, grandfathers, and great-grandfathers have successively undergone the penalty of death: "Such persons the city shall send away with all their possessions to the city and country of their ancestors, retaining only and wholly their appointed lot" (_ibid._ ix. 856). But this enactment had no doubt a purely utilitarian foundation, the offspring of a thoroughly wicked family being considered a danger to the city.]

Passing to the vengeance of gods: according to the Atharva-Veda, Agni, who forgives sin committed through folly and averts Varuna's wrath, also frees from the consequence of a sin committed by a man's father or mother.[270] Theognis asks, "How, O king of immortals, is it just that whoso is aloof from unrighteous deeds, holding no transgression, nor sinful oath, but being righteous, should suffer what is not just?"[271] According to Bion, the deity, in punishing the children of the wicked for their fathers' crimes, is more ridiculous than a doctor administering a potion to a son or grandson for a father's or grandfather's disease.[272] The early Greek notion of an inherited curse was modified into the belief that the curse works through generations because the descendants each commit new acts of guilt.[273] The persons who prohibited the sons of such as had been proscribed by Sylla, from standing candidates for their fathers' honours, and from being admitted into the senate, were supposed to have been punished by the gods for this injustice:--"In process of time," says Dionysius of Halicarnassus, "a blameless punishment, the avenger of their crimes, pursued {72} them, by which they themselves were brought down from the greatest height of glory, to the lowest degree of obscurity; and none, even, of their race are now left, but women."[274] Among the Hebrews, Jeremiah and Ezekiel broke with the old notion of divine vengeance. The law of individual responsibility, which had already previously been laid down as a principle of human justice, was to be extended to the sphere of religion.[275] "Every one shall die for his own iniquity: every man that eateth the sour grape, his teeth shall be set on edge."[276] "The soul that sinneth, it shall die. The son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son: the righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him."[277]

CHAPTER III

THE NATURE OF THE MORAL EMOTIONS (_continued_)

IT was said in the last chapter that moral disapproval is a sub-species of resentment, and that resentment is, in its essence, an aggressive attitude of mind towards an assumed cause of pain. It was shown that, in the course of mental evolution, the true direction of the hostile reaction involved in moral disapproval has become more apparent. We shall now see that, at the same time, its aggressive character has become more disguised.

This is evidenced by the changed opinion about anger and revenge which we meet at the higher stages of moral development. Retaliation is condemned, and forgiveness of injuries is laid down as a duty.

The rule that a person should be forbearing and kind to his enemy has no place in early ethics.

"Let those that speak evil of us perish. Let the enemy be clubbed, swept away, utterly destroyed, piled in heaps. Let their teeth be broken. May they fall headlong into a pit. Let us live, and let our enemies perish." Such were the requests which generally concluded the prayers of the Fijians.[1] A savage would find nothing objectionable in them. On the contrary, he regards revenge as a duty,[2] and forgiveness of enemies as a sign of weakness, or cowardice, or want of honour.[3] Nor {74} is this opinion restricted to the savage world. In the Old Testament the spirit of vindictiveness pervades both the men and their god. The last thing with which David on his death-bed charged Solomon was to destroy an enemy whom he himself had spared.[4] Sirach counts among the nine causes of a man's happiness to see the fall of his enemy.[5] The enemies of Yahveh can expect no mercy from him, but utter destruction is their lot.[6] To do good to a friend and to do harm to an enemy was a maxim of the ancient Scandinavians.[7] It was taken for a matter of course by popular opinion in Greece[8] and Rome. According to Aristotle, "it belongs to the courageous man never to be worsted"; to take revenge on a foe rather than to be reconciled is just, and therefore honourable.[9] Cicero defines a good man as a person "who serves whom he can, and injures none except when provoked by injury."[10] Except in domestic life and in the case of friends, Professor Seeley observes, "people not only did not forgive their enemies, but did not wish to do so, nor think better of themselves for having done so. That man considered himself fortunate who on his deathbed could say, in reviewing his past life, that no one had done more good to his friends or more mischief to his enemies. This was the celebrated felicity of Sulla; this the crown of Xenophon's panegyric on Cyrus the Younger."[11]

[Footnote 11: Seeley, _Ecce Homo_, p. 273.]

But side by side with the doctrine of resentment, we meet, among peoples of culture, the doctrine of forgiveness.

"Recompense injury with kindness," says Lao-Tsze.[12] According to Mencius, "a benevolent man does not lay up anger, nor cherish resentment against his brother, but only regards him with affection and love."[13] In the laws of Manu the following rule is laid down for the twice-born man:--"Against an angry man let him not in return show anger, let him bless {75} when he is cursed."[14] It is said in the Buddhistic Dhammapada: "Hatred does not cease by hatred at any time; hatred ceases by love, this is an old rule . . . . Among men who hate us we dwell free from hatred. . . . Let a man overcome anger by love, let him overcome evil by good; let him overcome the greedy by liberality, the liar by truth."[15] According to one of the Pahlavi texts, we ought not to indulge in wrathfulness; wrath is one of the fiends besetting man, and "goodness is little in the mind of a man of wrath."[16]

[Footnote 12: _Tâo Teh King_, ii. 63. 1. According to _Thâi-Shang_, 4, a bad man "broods over resentment without ceasing."]

[Footnote 13: Mencius, v. 1. 3. 2.]

[Footnote 16: _Dînâ-î-Maînôg-î Khirad_, ii. 16; xli. 11; xxxix. 26.]

In Leviticus hatred is condemned:--"Thou shalt not hate thy brother in thine heart. . . . Thou shalt not avenge, nor bear any grudge against the children of thy people."[17] Sirach, whom I have already quoted, says in another passage, "Forgive thy neighbour the hurt that he has done unto thee, so shall thy sins also be forgiven when thou prayest."[18] According to the Talmud, "whosoever does not persecute them that persecute him, whosoever takes an offence in silence, he who does good because of love, he who is cheerful under his sufferings they are the friends of God, and of them the Scripture says, And they shall shine forth as does the sun at noon-day."[19] The Koran, whilst repeating the old rule, "an eye for an eye and a tooth for a tooth,"[20] at the same time teaches that Paradise is "for those who repress their rage, and those who pardon men; God loves the kind."[21] Muhammedan tradition puts the following words in the mouth of the Prophet:--"Say not, if people do good to us, we will do good to them, and if people oppress us, we will oppress them: but resolve that if people do good to you, you will do good to them, and if they oppress you, oppress them not again."[22] Professor Goldziher emphasises Muhammed's opposition to the traditional rule of the Arabs that an enemy is a proper object of hatred;[23] and Syed Ameer Ali has collected various passages from the writings of Muhammedan scholars, which prove that, {76} in spite of what has often been said to the contrary, forgiveness of injuries is by no means foreign to the spirit of Islam.[24] Thus the author of the Kashshâf prescribes, "Seek again him who drives you away; give to him who takes away from you; pardon him who injures you: for God loveth that you should cast into the depth of your souls the roots of His perfections."[25] That "the sandal-tree perfumes the axe that fells it," is a saying in everyday use among the Muhammedans of India.[26] And Lane often heard Egyptians forgivingly say, on receiving a blow from an equal, "God bless thee," "God requite thee good," "Beat me again."[27]

[Footnote 26: Poole, _Studies in Mohammedanism_, p. 226.]

[Footnote 27: Lane, _Modern Egyptians_, p. 314 _sq._]

The principles of forgiveness had also advocates in Greece and Rome. In one of the Platonic dialogues, Socrates says, "We ought not to retaliate or render evil for evil to any one, whatever evil we may have suffered from him"; though he wisely adds that "this opinion has never been held, and never will be held, by any considerable number of persons."[28] The Stoics strongly condemned anger as unnatural and unreasonable. "Mankind is born for mutual assistance, anger for mutual ruin."[29] "Anger is a crime of the mind; . . . it often is even more criminal than the faults with which it is angry."[30] He is the best and purest "who pardons others as if he sinned himself daily, but avoids sinning as if he never pardoned."[31] "If any one is angry with you, meet his anger by returning benefits for it."[32] "The cynic loves those who beat him."[33]

[Footnote 28: Plato, _Crito_, p. 49.]

[Footnote 29: Seneca, _De ira_, i. 5.]

[Footnote 30: _Ibid._ i. 16; ii. 6.]

[Footnote 31: Pliny, _Epistolæ_, ix. 22 (viii. 22).]

[Footnote 32: Seneca, _op. cit._ ii. 34.]

[Footnote 33: Epictetus, _Dissertationes_, iii. 22, 54.]

Forgiveness of enemies is thus by no means an exclusively Christian tenet, although it has never before or after been inculcated with the same emphasis as it was by Jesus. "Love your enemies; bless them that curse you, do good to them that hate you, and pray for them which despitefully use you, and persecute you."[34] When St. Peter asked, "Lord, how oft shall my brother sin against me, and I forgive him? till seven times?" Jesus replied, "I say not unto thee, Until seven times: but, Until seventy times seven,"[35]--that is, as often as he repeats the offence. It would seem that Jesus by these sentences expressly forbade men to avenge themselves, or even {77} to feel resentment on their own behalf; and so also he was understood by St. Paul.[36]

[Footnote 34: _St. Matthew_, v. 44. _Cf._ _ibid._ v. 39 _sq._; vi. 14 _sq._; _St. Luke_, vi. 27 _sqq._; xvii. 3 _sq._; _St. Mark_, xi. 25 _sq._]

[Footnote 35: _St. Matthew_, xviii. 21 _sq._]

[Footnote 36: _Romans_, xii. 19 _sqq._; _1 Thessalonians_, v. 14 _sq._; _Colossians_, iii. 12 _sq._]

The rule of retaliation and the rule of forgiveness, however, are not so radically opposed to each other as they appear to be. What the latter condemns is, in reality, not every kind of resentment, but non-moral resentment; not impartial indignation, but personal hatred. It prohibits revenge, but not punishment. According to the Laws of Manu, crime was so indispensably to be followed by punishment, that if the king pardoned a thief or a perpetrator of violence, instead of slaying or striking him, the guilt fell on the king;[37] and if Lao-tsze was an enemy to the infliction of any kind of suffering, it was because he held that in a well-governed State the necessity for punishment could not arise, as crime would cease to exist.[38] The Chinese book, _Merits and Errors Scrutinised_, which regards it as a merit to refrain from avenging an injury, adds that, "if a man should omit to avenge the injuries of his parents, it would become an error."[39] Jesus was certainly not free from righteous indignation. It does not appear that he ever forgave the legalists who sinned against the kingdom of God, and he told his disciples that, if a brother who had trespassed against his brother neglected to hear the church, he should be looked upon as a heathen and a publican.[40] Christian writers have laid much stress upon the circumstance that Jesus enjoined men to forgive their own enemies, but not to abstain from resenting injuries done to others. According to Thomas Aquinas, "the good bear with the wicked to this extent, that, so far as it is proper to do so, they patiently endure at their hands the injuries done to themselves; but they do not bear with them to the extent of enduring the injuries done to God and their neighbours. For Chrysostom says, 'For it {78} is praiseworthy to be patient under one's own wrongs, but the height of impiety to dissemble injuries done to God.'"[41] Practically, at least, Christianity has not altered the validity of the Aristotelian rule that anger admits not only of an excess, but of a defect, and that we ought to feel angry at certain things.[42] As Plutarch says, we even think those worthy of hatred who are not vexed at hateful individuals; and we can sympathise with the man who, hearing somebody praise Charillus, king of Sparta, for his gentleness, replied, "How can Charillus be good, who is not harsh

even to the bad?"[43] Moreover, the belief in a transcendental retributive justice, in an ultimate punishment of badness, which we meet with in Taouism,[44] Brahmanism, Buddhism,[45] Christianity,[46] side by side with the doctrine of forgiveness, is based upon the demand that wrong should be resented.

[Footnote 37: _Laws of Manu_, viii. 316, 346 _sq._ _Cf._ _Gautama_, xii. 45; _Âpastamba_, i. 9. 25. 5.]

[Footnote 38: Douglas, _Confucianism and Taouism_, p. 204.]

[Footnote 39: 'Merits and Errors scrutinised,' in _Indo-Chinese Gleaner_, iii. 153.]

[Footnote 40: _St. Matthew_, xviii. 15 _sqq._]

[Footnote 42: Aristotle, _Ethica Nicomachea_, ii. 7. 10; iii. 1. 24; iv. 5. 3 _sqq._]

[Footnote 43: Plutarch, _De invidia et odio_, 5.]

[Footnote 44: Douglas, _op. cit._ p. 257.]

[Footnote 45: _Dhammapada_, i. 15, 17; x. 137 _sqq._]

[Footnote 46: _Cf._ _Romans_, xii. 19: "Vengeance is mine; I will repay, saith the Lord."]

It is easy to see why enlightened and sympathetic minds disapprove of resentment and retaliation springing from personal motives. Such resentment is apt to be partial. It is too often directed against persons whom impartial reflection finds to be no proper objects of indignation, and still more frequently it is unduly excessive. As Butler ays, "we are in such a peculiar situation, with respect to injuries done to ourselves, that we can scarce any more see them as they really are, than our eye can see itself."[47] "As bodies seem greater in a mist, so do little matters in a rage"; hence the old rule that we ought not to punish whilst angry.[48] The more the moral consciousness is influenced by sympathy, the more severely it condemns any retributive infliction of pain which it regards as undeserved; and it seems to be in the first place with a {79} view to preventing such injustice that teachers of morality have enjoined upon men to love their enemies. It would, indeed, be absurd to blame a person for expressing moral indignation at an act simply because he himself happens to be the offended party; practically we allow him to be even more indignant than the impartial spectator would be, whereas excessive placability often meets with censure. Like Aristotle, we maintain that "to submit to insult, or to overlook an insult offered to our friends, shows a slavish spirit"[49]; and we agree with the Confucian maxims, that injuries should be recompensed, not with kindness, but with justice, and that nobody but he who deserves it should be an object of hatred.[50]

[Footnote 47: Butler, 'Sermon IX.--Upon Forgiveness of Injuries,' in _Analogy of Religion, &c._, p. 469.]

[Footnote 48: Plutarch, _De cohibenda ira_, 11. Montaigne, _Essais_, ii. 31 (_Oeuvres_, p. 396).]

[Footnote 49: Aristotle, _Ethica Nicomachea_, 5. 6.]

[Footnote 50: _Lun Yü_ xiv. 36. 3; xvii. 9. 1, 5; xvii. 24. 1. Douglas, _Confucianism and Taouism_, p. 9. _Cf._ _Chung Yung_, x. 3; xxxi. 1; xxxiii. 4.]

At the same time, the injunctions of moralists that unjust resentment should be suppressed, are far from introducing any absolutely new element into the estimation of conduct. They only represent a higher stage of a process of moral development the early phases of which are found already in primitive societies. Even the savage who enjoins revenge as a duty, regards revenge under certain circumstances as wrong.[51] The restraining rule of like for like, as we shall see, is an instance of this.

[Footnote 51: Concerning the Dacotahs, Prescott observes, "There are cases where the Indians say retaliation is wrong, and they try to prevent it" (Schoolcraft, _Indian Tribes_, ii. 197).]

The aggressive character of moral disapproval has become more disguised, not only by the more scrutinising attitude towards the resentment and retaliation which distinguishes the moral consciousness of a higher type, but by the different way in which the aggressiveness displays itself. The infliction of suffering merely for the sake of retribution is condemned, and the rule is laid down that we should hate, not the sinner, but only the sin.

Punishment, which expresses more or less faithfully the moral indignation of the society which inflicts it, is externally similar to an act of revenge; it causes, or is intended {80} to cause, pain in return for inflicted pain. For ages it was looked upon as a matter of course that if a person had committed an offence he should have to suffer for it. This is still the notion of the multitude, as also of a host of theorisers, who, by calling punishment an expiation, or a reparation, or a restoration of the disturbed equilibrium of justice, only endeavour to give a philosophical sanction to a very simple fact, the true nature of which they too often have failed to grasp. The infliction of pain, however, is not an act which the moral consciousness regards with indifference, even in the case of a criminal; and to many enlightened minds with keen sympathy for human suffering, it has appeared both unreasonable and cruel that the State should wilfully torment him to no purpose. But whilst retributive punishment has been condemned, punishment itself has been defended; it is only looked upon in a different light, not as an end by itself, but as a means of attaining an end. It is to be inflicted, not because wrong has been done, but in order that wrong be not done. Its object is held to be, either to deter from crime, or to reform the criminal, or by means of elimination or seclusion, to make it physically impossible for him to commit fresh crimes.

These views were expressed already in Greek and Roman antiquity.[52] According to Plato, a reasonable man punishes for the sake of deterring from wickedness, or with a view to correcting the offender.[53] Aristotle looks upon punishment as a moral medicine.[54] Seneca maintains that the law, in punishing wrong, aims at three ends: "either that it may correct him whom it punishes, or that his punishment may render other men better, or that, by bad men being put out of the way, the rest may live without fear."[55] In modern times all these theories have had, and still have, their numerous adherents. According to Hugo Grotius, "men are so bound together by their common {81} nature, that they ought not to do each other harm, except for the sake of some good to be attained"; hence "man is not rightly punished by man merely for the sake of punishing"; advantage alone makes punishment right--"either the advantage of the offender, or of him who suffers by the offence, or of persons in general."[56] For a long time the view taken by Hobbes, that "the aym of Punishment is not a revenge, but terrour,"[57] remained the leading doctrine on the subject, among philosophers, as well as legislators. It was shared by Montesquieu,[58] Beccaria,[59] and filangieri,[60] by Anselm von Feuerbach[61] and Schopenhauer,[62] and, in the main, by Bentham.[63] During the nineteenth century the principle of determent was largely superseded by the principle of reformation; whilst certain contemporary criminologists--like some previous ones[64]--are of opinion that punishment should aim to repress crime by an "absolute" or "relative elimination" of the criminal, that is, in extreme cases by killing him, but generally by incarcerating him in a criminal lunatic asylum, or by banishing him for ever or for a certain period, or by interdicting him from a particular neighbourhood.[65]

[Footnote 65: Garofalo, _Criminologie_, p. 251 _sqq._ Ferri, _Criminal Sociology_, p. 204 _sqq._]

The advocates of these various theories are unanimous in condemning retributive punishment as wrong. Without the grounds of social defence, says M. Guyau, "the punishment would be as blameworthy as the crime, and . . . the lawgivers and the judges, by deliberately condemning the guilty to punishment, would become their fellows."[66] For my own part I believe, on the contrary, that those who would venture to carry out all the consequences to which the theories of social defence or of reformation might lead, would be regarded even as more criminal than those they punished, not only by the {82} opponents, but probably by the very supporters of the theories in question. A brief statement of some of those consequences will, I hope, suffice to prove that punishment can hardly be guided exclusively by utilitarian considerations, but requires the sanction of the retributive emotion of moral disapproval.

[Footnote 66: Guyau, _Esquisse d'une morale sans obligation ni sanction_, p. 148.]

The principle of repressing crime by eliminating the criminal may at once be put aside, because it has no reference to the _punishment_ of criminals, although it contains a suggestion--and a most excellent one indeed--as to the proper mode of treating them. Their exclusion from the company of their fellow-men--not to speak of their elimination by death--certainly entails suffering, but, according to the principle with which we are dealing, this suffering is not _intended_. On the other hand, punishment, in the ordinary sense of the word, always involves an express intention to inflict pain, whatever be the object for which pain is inflicted. We do not punish an ill-natured dog when we tie him up so as to prevent him from doing harm, nor do we punish a lunatic by confining him in a madhouse.

According to the principle of determent, the infliction of suffering in consequence of an offence is justified as a means of increasing public safety. The offender is sacrificed for the common weal. But why the offender only? It is quite probable that a more effective way of deterring from crime would be to punish his children as well; and if the notion of justice derived all its import from the result achieved by the punishment, there would be nothing unjust in doing so. The only objection which, from this point of view, might ever be raised against the practice of visiting the wrongs of the fathers upon the children, is that it is needlessly severe; the innocence of the children could count for nothing. Nor do I see why the law should not allow our own judges now and then to follow the example of their Egyptian colleague who in an intricate lawsuit caused a person avowedly innocent to be bastinadoed with the hope that whoever was the real {83} culprit might be induced to confess out of compassion.[67] Moreover, if the object of punishment is merely preventive, the heaviest punishment should be threatened where the strongest motive is needed to restrain. Consequently, an injury committed under great temptation, or in a passion, should be punished with particular severity; whereas a crime like parricide might be treated with more indulgence than other kinds of homicide, owing to the restraining influence of filial affection. Could the moral consciousness approve of this?

[Footnote 67: Burckhardt, _Arabic Proverbs_, p. 103 _sq._]

Again, if punishment were to be regulated by the principle of reforming the criminal, the result would in some cases be very astonishing. There is no more incorrigible set of offenders than habitual vagrants and drunkards, whereas experience has shown that the most easily reformed of all offenders is often some person who has committed a serious crime. According to the reformation theory, the latter should soon be set free, whilst the petty offender might have to be shut up for all his life. Nay more, if the criminal proves absolutely incorrigible, and not the slightest hope of his reformation is left, there would no longer be any reason for punishing him at all.[68] The reformationist may also be asked why he does not try some more humane method of improving people's characters than by the infliction of suffering.

[Footnote 68: _Cf._ Morrison, _Crime and its Causes_, p. 203; Durkheim, _Division du travail social_, p. 94.]

It may seem strange that theories which are open to such objections should have been able to attract so many intelligent partisans. These theories must at least possess a certain plausibility. If punishment on the one hand springs from moral indignation, and on the other hand is frequently interpreted as a means either of deterring from crime or of reforming the criminal, there must obviously be some connection between these ends and the retributive aim of moral resentment. There must be certain facts which, to some extent, fill up the gap between the theory of retribution and the other theories of punishment.

{84} The doctrine of determent regards punishment as a means of preventing crime. A crime always involves the infliction of pain; and the one thing which men try to prevent for its own sake is pain. The one thing which arouses resentment is likewise pain. There must consequently be a general coincidence between the acts which people resent and the acts which the law would punish if it were framed on the principle of determent. But the resemblance between the desire to deter and resentment is greater still. Resentment is not only aroused by pain, but is a hostile attitude towards its cause, and its intrinsic object is to remove this cause,

that is, to prevent pain. An act of moral resentment is therefore apt to resemble a punishment inflicted with a view to deterring from crime, provided that the punishment is directed against the cause of crime--the criminal himself--and is not unduly severe.

The doctrine of reformation aims at the removal of a criminal disposition of mind by improving the offender. Moral resentment likewise aims at the removal of a volitional cause of pain, by bringing about repentance in the offender. That repentance ought to be followed by forgiveness, partial or total, is a widely recognised moral claim.

According to the Chinese Penal Code, whoever, having committed an injury which can be repaired by restitution or compensation, surrenders himself voluntarily, and acknowledges his guilt to a magistrate, before it is otherwise discovered, shall be freely pardoned, though all claims upon his property shall be duly liquidated.[69] In Madagascar, according to a law made in 1828, "all the fines shall be reduced one-half, according to the nature of the fines, if the persons guilty accuse themselves."[70] According to Zoroastrianism, one element of atonement consists in repentance, as manifested by avowal of the guilt and by the recital of a formula, the _Patet_.[71] It is said in the Laws of Manu:--"In proportion as a man who has done wrong, himself {85} confesses it, even so far he is freed from guilt, as a snake from its slough. . . . He who has committed a sin and has repented, is freed from that sin, but he is purified only by the resolution of ceasing to sin and thinking 'I will do so no more.'"[72] According to the Rig-Veda, Varuna inflicts terrible punishments on the hardened criminal, but is merciful to him who repents; to Varuna the cry of anguish from remorse ascends, and before him the sinner comes to discharge himself of the burden of his guilt by confession.[73] So, also, Zeus pardons the repentant.[74] The main doctrine of Judaism on the subject of atonement is comprised in the single word Repentance. No teachers, says Mr. Montefiore, "exalted the place and power of repentance more than the Rabbis. There was no sin for which in their eyes a true repentance could not obtain forgiveness from God."[75] According to the Talmud, a space of only two fingers' breadth lies between Hell and Heaven: the sinner has only to repent sincerely, and the gates to everlasting bliss will spring open.[76] Jesus commanded his disciples to forgive injuries if followed by repentance:--"If thy brother trespass against thee, rebuke him; and if he repent, forgive him. And if he trespass against thee seven times in a day, and seven times in a day turn again to thee, saying, I repent; thou shalt forgive him."[77]

[Footnote 77: _St. Luke_, xvii. 3 _sq._]

But repentance not only blunts the edge of moral indignation and recommends the offender to the mercy of men and gods: it is the sole ground on which pardon can be given by a scrupulous judge. When sufficiently guided by deliberation and left to itself, without being unduly checked by other emotions, the feeling of moral resentment is apt to last as long as its cause remains unaltered, that is until the will of the offender has ceased to be offensive; and it ceases to be offensive only when he acknowledges his guilt and repents. It is true that the mere performance of certain ceremonies is frequently supposed to relieve the performer of his sins,[78] and that the {86} same end is thought to be attained by pleasing God in some way or other, by sacrifice, or alms-giving, or the like. Men even lay claim to divine forgiveness as a right belonging to them in virtue of some meritorious deeds of theirs, according to the doctrine of _opera supererogativa_--a doctrine which, in substance, is not restricted to Roman Catholicism, but is found, in a more or less developed form, in Judaism,[79] Muhammedanism,[80] Brahmanism,[81] and degenerated Buddhism.[82] But all such ideas are objectionable to the moral consciousness of a higher type. They are based on the crude notion that sin is a material substance which may be removed by material means; or on the belief that an offender may compound with the deity for sinning against him, in the same way as he pacifies his injured neighbour, by bribery or flattery; or on the assumptions that by a good or meritorious deed

a man has done more than his duty, that a good deed stands in the same relation to a bad deed as a claim to a debt, that the claim is made on the same person to whom the debt is due, namely, God--even though it beinclihedinclihed only by his mercy--and that the debt consequently may be compensated by the claim in the same way as the payment of a certain sum may compensate for a loss inflicted. This doctrine attaches badness and goodness to external acts rather than to mental facts. Reparation implies compensation for a loss. The loss may be compensated by the bestowal of a corresponding advantage; but no reparation can be given for badness. Badness can only be forgiven, and moral forgiveness can be granted only on condition that the agent's mind has undergone a radical alteration for the better, that the badness of the will has given way to repentance.[83] Hence the Reformation {87} proscribed offerings for the redemption of sins, together with the trade in indulgences; and we meet with an analogous movement in other comparatively advanced forms of religion. In reformed Brahmanism, repentance is declared to be the only means of redeeming trespasses.[84] The idea expressed in the Psalms, that God delights not in burnt offerings, but that the sacrifices of God are a broken and a contrite heart,[85] became the prevailing opinion among the Rabbis, most of whom regarded repentance as the _conditio sine quâ non_ of expiation and the forgiveness of sins.[86] Let us also remember that he who commanded his followers to forgive a brother for his sin, at the same time pronounced the qualification: "if he repent."[87]

[Footnote 87: _Cf._ Martineau, _Types of Ethical Theory_, ii. 203.]

That moral indignation is appeased by repentance, and that repentance is the only proper ground for forgiveness, is thus due, not to the specifically moral character of such indignation, but to its being a form of resentment. This is confirmed by the fact that an angry and revengeful man is apt to be in a similar way influenced by the sincere apologies of the offender. As Aristotle said, men are placable in regard to those who acknowledge and repent their guilt: "there is proof of this in the case of chastising servants; for we chastise more violently those who contradict us, and deny their guilt; but towards such as acknowledge themselves to be justly punished, we cease from our wrath."[88] To take an instance from the savage world. The Caroline Islander, according to Mr. Christian, "is inclined to be revengeful, and will bide his time patiently until his opportunity comes. Yet he is not implacable, and counts reconciliation a noble and a princely thing. There is a form of etiquette to be observed on {88} these occasions--a present (_katom_) is made, an apology offered--a piece of sugar-cane accepted by the aggrieved party--honour is satisfied and the matter ends."[89] In the case of revenge, external satisfaction or material compensation is often allowed to take the place of genuine repentance, and the humiliation of the adversary may be sufficient to quiet the angry passion. But the revenge felt by a reflecting mind is not so readily satisfied. It wants to remove the cause which aroused it. The object which resentment is chiefly intent upon, Adam Smith observes, "is not so much to make our enemy feel pain in his turn, as to make him conscious that he feels it upon account of his past conduct, to make him repent of that conduct, and to make him sensible, that the person whom he injured did not deserve to be treated in that manner."[90] The delight of revenge, says Bacon, "seemeth to be not so much in doing the hurt, as in making the party repent."[91]

[Footnote 88: Aristotle, _Rhetorica_, ii. 3. 5.]

[Footnote 89: Christian, _Caroline Islands_, p. 72.]

[Footnote 90: Adam Smith, _Theory of Moral Sentiments_, p. 138 _sq._]

[Footnote 91: Bacon, 'Essay IV. Of Revenge,' in _Essays_, p. 45. _Cf._ Montaigne, _Essais_, ii. 27 (_Oeuvres_, p. 384).]

We can now see the origin of the idea that the true end of punishment is the reformation of the criminal. This idea merely emphasises the most humane element in resentment, the demand that the offender's will shall cease to be offensive. The principle of reformation has thus itself a retributive origin. This explains the fact, otherwise inexplicable, that the amendment which it has in view is to be effected by the infliction of pain. It also accounts for the inconsistent attitude of the reformationist towards incorrigible offenders, already commented upon. Resentment gives way to forgiveness only in the case of repentance, not in the case of incorrigibility. Hence, not even the reformationist regards incorrigibility as a legitimate ground for exempting a person from punishment, although this flatly contradicts his theory about the true aim of all punishment.

Thus the theories both of determent and of reformation are ultimately offspring of the same emotion that first {89} induced men to inflict punishment on their fellow-creatures. It escaped the advocates of these theories that they themselves were under the influence of the very principle they fought against, because they failed to grasp its true import. Rightly understood, resentment is preventive in its nature, and, when sufficiently deliberate, regards the infliction of suffering as a means rather than as an end. It not only gives rise to punishment, but readily suggests, as a proper end of punishment, either determent or amendment or both. But, first of all, moral resentment wants to raise a protest against wrong. And the immediate aim of punishment has always been to give expression to the righteous indignation of the society which inflicts it.

Now it may be thought that men have no right to give vent to their moral resentment in a way which hurts their neighbours unless some benefit may be expected from it. In the case of many other emotions, we hold that the conative element in the emotion ought not to be allowed to develop into a distinct volition or act; and it would seem that a similar view might be taken with reference to the aggressiveness inherent in moral disapproval. It is a notion of this kind that lies at the bottom of the utilitarian theories of punishment. They are protests against purposeless infliction of pain, against crude ideas of retributive justice, against theories hardly in advance of the low feelings of the popular mind. Therefore, they mark a stage of higher refinement in the evolution of the moral consciousness; and if the principles of determent and reformation are open to objections which will be shared by almost everyone, that is due to other circumstances than their demand that punishment should serve a useful end. As we have seen, they ignore the fact that a punishment, in order to be recognised as just, must not transgress the limits set down by moral disapproval, that it must not be inflicted on innocent persons, that it must be proportioned to the guilt, that offenders who are amenable to discipline must not be treated more severely {90} than incorrigible criminals. These theories also seem to exaggerate the deterring or reforming influence which punishments exercise upon criminals,[92] whilst, in another respect, they take too narrow a view of its social usefulness. Whether its voice inspire fear or not, whether it wake up a sleeping conscience or not, punishment, at all events, tells people in plain terms what, in the opinion of the society, they ought not to do. It gives the multitude a severe lesson in public morality; and it is difficult to see how quite the same effect could be attained by any other method. Retaliation is such a spontaneous expression of indignation, that people would hardly realise the offensiveness of an act which evokes no signs of resentment. Of course, punishment, in the legal sense of the term, is only one form--the most concrete form--of public retaliation; it is, indeed, probable that public opinion exercises a greater influence on men than punishment would do without its aid.[93] But punishment, in combination with public opinion, has no doubt to some extent an educating, and not merely a deterring, influence upon the members of a society. As Sir James Stephen observes, "the sentence of the law is to the moral sentiment of the public in relation to any offence what a seal is to hot wax. It converts into a permanent final judgment what might otherwise be a transient sentiment."[94] finally, it must not be overlooked that the infliction of punishment upon the perpetrator of a grave offence gratifies a strong general desire, and, even though the pain which always accompanies an unsatisfied desire would by itself afford no sufficient justification for subjecting the offence to such intense {91} suffering, other more serious consequences might easily result from leaving him unpunished. The public indignation might find a vent in some less regular and less discriminating mode of retaliation, like lynching; or, on the other hand, by remaining unsatisfied, the desire might dwindle away from want of nourishment, and the moral standard suffer a corresponding loss.

[Footnote 92: On the limited efficiency of punishment as a deterrent, see Ferri, _op. cit._ p. 82 _sq._ On the moral insensibility of the instinctive and habitual criminal, and absence of remorse, see Havelock Ellis, _The Criminal_, p. 124 _sqq._]

[Footnote 93: _Cf._ Locke, _Essay concerning Human Understanding_, ii. 28. 12 (_Philosophical Works_, p. 283); Shaftesbury, 'Inquiry concerning Virtue and Merit,' i. 3. 3, in _Characteristicks_, ii. 64.]

[Footnote 94: Stephen, _History of the Criminal Law of England_, ii. 81. _Cf._ Shaftesbury, _op. cit._ ii. 64: "As to punishments and rewards, their efficacy is not so much from the fear or expectation which they raise, as from a natural esteem of virtue, and detestation of villainy, which is awaken'd and excited by these publick expressions of the approbation and hatred of mankind in each case."]

However, it is not to be believed that, in practice, the infliction of punishment is, or ever will be, regulated merely by considerations of social utility, even within the limits of what is recognised as legitimate by the moral sentiment. The retributive desire is so strong, and appears so natural, that we can neither help obeying it, nor seriously disapprove of its being obeyed. The theory that we have a right to punish an offender only in so far as, by doing so, we promote the general happiness, really serves in the main as a justification for gratifying such a desire, rather than as a foundation for penal practice. Moreover, this theory refers, and pretends to refer, only to outward behaviour--to punishment, not to the emotion from which punishment springs. It condemns the retributive act, not the retributive desire.

But at the same time the aggressive element in the emotion itself has undergone a change, which tends to conceal its true nature by partly leading it into a new channel, or, rather, by narrowing the channel in which it discharges itself. Resentment is directed against the cause of the offence by which it was aroused--broadly speaking, the offender. But when duly reflecting upon the matter, we cannot fail to admit that the real cause was not the offender as a whole, but his will. Deliberate and discriminating resentment is therefore apt to turn against the will rather than against the willer; as we have seen, it is desirous to inflict pain on the offender chiefly as a means of removing the cause of pain suffered, _i.e._, the existence of the bad will. If this is the case with deliberate resentment in general, it must particularly be the case with moral indignation, which is more likely to be {92} influenced by sympathy, and hence more discriminate, than non-moral resentment. This fact gives rise to the moral commandment that we should hate, not the sinner, but the sin. The hostile reaction should be focussed on the will of the offender, and his sensibility should be regarded merely as an instrument through which the will is worked upon. But there is little hope that such a demand can ever be strictly enforced. Professor Sidgwick justly remarks that, though moralists try to distinguish between anger directed "against the act" and anger directed "against the agent," it may be fairly doubted whether it is within the capacity of ordinary human nature to maintain this distinction in practice.[95] The will which offends, and the sensibility which suffers, cannot seriously be looked upon as two different entities the one of which should not be punished for the fault of the other. The person himself is held responsible for the offence. The hostile reaction turns against his will because only by acting upon the will can the cause of pain be removed. But since the remotest ages the aggressive attitude towards this cause has been connected with an instinctive desire to produce counter-pain; and, though we may recognise that such a desire, or rather the volition into which it tends to develop, may be morally justifiable only if it is intended to remove the cause of pain, we can hardly help being indulgent to the gratification of a human instinct which seems to be well nigh ineradicable. It is the instinctive desire to inflict counter-pain that gives to moral indignation its most important characteristic. Without it, moral condemnation and the ideas of right and wrong would never have come into existence. Without it, we should no more condemn a bad man than a poisonous plant. The reason why moral judgments are passed on volitional beings, or their acts, is not merely that they are volitional, but that they are sensitive as well; and however much we try to concentrate our indignation on the act, it derives its peculiar flavour from being directed {93} against a sensitive agent. I have heard persons of a highly sympathetic cast of mind assert that a wrong act awakens in them only sorrow, not indignation; but though sorrow be the predominant element in their state of mind, I believe that, on a close inspection, they would find there another emotion as well, one in which there is immanent an element of hostility, however slight. It is true that the intensity of moral indignation cannot always be measured by the actual desire to cause pain to the offender; but its intensity seems nevertheless to be connected with the amount of suffering which the indignant man is willing to let the offender undergo in consequence of the offence. Which of us could ever, quite apart from any utilitarian considerations, feel the same sympathy with a person who suffers on account of his badness as with one who suffers innocently? It is one of the most interesting facts related to the moral consciousness of a higher type, that it in vain condemns the gratification of the very desire from which it sprang. It is like a man of low extraction, who, in spite of all acquired refinement, bears his origin stamped on his face.

[Footnote 95: Sidgwick, _Methods of Ethics_, p. 364.]

* * * * *

Whilst resentment is a hostile attitude of mind towards a cause of pain, retributive kindly emotion is a friendly attitude of mind towards a cause of pleasure. Just as in the lower forms of anger there is hardly any definite desire to produce suffering, only a vehement desire to remove the cause of pain, so in the lower form of retributive kindly emotion there is hardly any definite desire to produce pleasure, only a friendly endeavour to retain the cause of the pleasure experienced. When the emotion contains a definite desire to give pleasure in return for pleasure received, and at the same time is felt by the favoured party in his capacity of being himself the object of the benefit, it is called gratitude. We often find intermingled with gratitude a feeling of indebtedness; he upon whom a benefit has been conferred feels himself as a debtor, and regards the benefactor as his creditor. This feeling has {94} even been represented as essential to, or as a condition of, gratitude;[96] but it is not implied in what I here understand by gratitude. It is one thing to be grateful, and another thing to feel that it is one's duty to be grateful. A depression of the "self-feeling," a feeling of humiliation, also frequently accompanies gratitude as a motive for requiting the benefit; but it is certainly not an element in gratitude itself.

[Footnote 96: Horwicz, _Psychologische Analysen_, ii. 333: "Ohne dieses Gefühl des Verbundenseins . . . . kann keine Dankbarkeit auskommen." _Cf._ Milton, _Paradise Lost_, iv. 52 _sqq._]

Retributive kindly emotion is a much less frequent phenomenon in the animal kingdom than is the emotion of resentment. In many animal species not even the germ of it is found, and where it occurs it is generally restricted within narrow limits. Anybody may provoke an animal's anger, but only towards certain individuals it is apt to feel retributive kindliness. The limits for this emotion are marked off by the conditions under which altruistic sentiments in general tend to arise--a subject which will be discussed in another connection. Indeed, social affection is itself essentially retributive. Gregarious animals take pleasure in each other's company, and with this pleasure is intimately associated kindly feeling towards its cause, the companion himself. Social affection presupposes reciprocity; it is not only a friendly sentiment towards another individual, but towards an individual who is conceived of as a friend.

The intrinsic object of retributive kindliness being to retain a cause of pleasure, we may assume that the definite desire to produce pleasure in return for pleasure received is due to the fact that such a desire materially promotes the object in question--exactly in the same way as the definite desire to inflict pain in return for pain inflicted has become an element in resentment because such a desire promotes the intrinsic object of resentment, the removal of the cause of pain. And as natural selection accounts for the origin of resentment, so it also accounts for the {95} origin of retributive kindly emotion. Both of these emotions are useful states of mind; by resentment evils are averted, by retributive kindliness benefits are secured. That there is such a wide difference in their prevalence is explicable from the simple facts that gregariousness--which is the root of social affection, and, largely at least, a condition of the rise of retributive kindly emotions--is an advantage only to some species, not to all, and that even gregarious animals have many enemies, but few friends.

In some cases the friendly reaction in retributive kindliness is directed towards individuals who have in no way been the cause of the pleasure which gave rise to the emotion. So intimate is the connection between the stimulus and the reaction, that he who is made happy often feels a general desire to make others happy.[97] But such an indiscriminate reaction is only an offset of the emotion with which we are here concerned. Moreover, retributive kindly emotion often confers benefits upon somebody nearly related to the benefactor, if he himself be out of reach, or in addition to benefits conferred on him. But in such cases the gratitude towards the benefactor is the real motive.

[Footnote 97: That a happy man wants to see glad faces around him, is also due to another cause, which has been pointed out by Dr. Hirn (_Origins of Art_, p. 83): from their expression he wants to derive further nourishment and increase for his own feeling.]

That moral approval--by which I understand that emotion of which moral praise or reward is the outward manifestation--is a kind of retributive kindly emotion and as such allied to gratitude, will probably be admitted without much hesitation.[98] Its friendly character is not, like the hostile character of moral disapproval, disguised by any apparently contradictory facts. To confer a benefit upon a person is not generally regarded as wrong, unless, indeed, it involves an encroachment on somebody's rights or is contrary to the feeling of justice. And that moral approval sometimes bestows its favours upon undeserving {96} individuals for the merits of others, can no more invalidate the fact that it is essentially directed towards the cause of pleasure, than the occasional infliction of punishments upon innocent individuals invalidates the fact that moral disapproval is essentially directed against the cause of pain. Unmerited rewards are explicable on grounds analogous to those to which we have traced unmerited punishments.

[Footnote 98: The relationship between gratitude and moral approval has been recognised by Hartley (_Observations on Man_, i. 520) and Adam Smith (_Theory of Moral Sentiments_, _passim_).]

The doctrine of family solidarity leads, not only to common responsibility for crimes, but to common enjoyment of merits.

In Madagascar, exemption from punishment was claimed by the descendants of persons who had rendered any particular service to the sovereign or the State, as also by other branches of the family, on the same plea.[99] According to Chinese ideas, the virtuous conduct of any individual will result, not only in prosperity to himself, but in a certain quantity of happiness to his posterity, unless indeed the personal wickedness of some of the descendants neutralise the benefits which would otherwise accrue from the virtue of the ancestor;[100] and, conversely, the Chinese Government confers titles of nobility upon the dead parents of a distinguished son.[101] The idea that the dead share in _punya_ or _pâpa_, that is, the merit or demerit of the living, and that the happiness of a man in the next life depends on the good works of his descendants, was early familiar to the civilised natives of India; almost all legal deeds of gift contain the formula that the gift is made "for the increase of the _punya_ of the donor and that of his father and mother."[102]

[Footnote 99: Ellis, _History of Madagascar_, 376.]

[Footnote 100: Giles, _Strange Stories from a Chinese Studio_, i. 426, n. 3; ii. 384, n. 63. Doolittle, _Social Life of the Chinese_, ii. 398.]

[Footnote 101: Giles, _op. cit._ i. 305, n. 6. Wells Williams, _Middle Kingdom_, i. 422.]

[Footnote 102: Barth, _Religions of India_, p. 52, n. 4.]

But the vicarious efficacy of good deeds is not necessarily restricted to the members of the same family.

In a hymn of the Rig-Veda we find the idea that the merits or the pious may benefit their neighbours.[103] According to one of the Pahlavi texts, persons who are wholly unable to perform good works are supposed to be entitled to a share of any supererogatory good works performed by others.[104] The Chinese believe that {97} whole kingdoms are blessed by benevolent spirits for the virtuous conduct of their rulers.[105] Yahveh promised not to destroy Sodom for the sake of ten righteous, provided that so many righteous could be found in the town.[106] The doctrine of vicarious reward or satisfaction through good works is, in fact, more prevalent than the doctrine of vicarious punishment. Jewish theology has a great deal more to say about the acceptance of the merits of the righteous on behalf of the wicked, than about atonement through sacrifice.[107] The Muhammedans, who know nothing of vicarious suffering as a means of expiation, confer merits upon their dead by reciting chapters of the Koran and almsgiving, and some of them allow the pilgrimage to Mecca to be done by proxy.[108] Christian theology itself maintains that salvation depends on the merit of the passion of Christ; and from early times the merits of martyrs and saints were believed to benefit other members of the Church.[109]

[Footnote 103: _Rig-Veda_, vii. 35. 4.]

[Footnote 104: _Dînâ-î-Maînôg-î Khirad_ xv. 3.]

[Footnote 109: Harnack, _History of Dogma_, ii. 133, n. 3.]

For the explanation of these and similar facts various circumstances have to be considered. Good deeds may be so pleasing to a god as to induce him to forgive the sins of the wicked in accordance with the rule that anger yields to joy. There is solidarity not only between members of the same family, but between members of the same social unit; hence the virtues of individuals may benefit the whole community to which they belong. The Catholic theologian argues that, since we are all regenerated unto Christ by being washed in the same baptism, made partakers of the same sacraments, and, especially, of the same meat and drink, the body and blood of Christ, we are all members of the same body. "As, then, the foot does not perform its functions solely for itself, but also for the benefit of the eyes; and as the eyes exercise their sight, not for their own, but for the common benefit of all the members; so should works of satisfaction be deemed common to all the members of the {98} Church."[110] Moreover, virtues, like sins, are

believed to be in a material way transferable. In Upper Bavaria, when a dead person is laid out, a cake of flour is placed on his breast in order to absorb the virtues of the deceased, whereupon the cake is eaten by the nearest relatives.[111] And we are told that, in a certain district in the north of England, if a child is brought to the font at the same time as a body is committed to the ground, whatever was "good" in the deceased person is supposed to be transferred to the little child, since God does not allow any "goodness" to be buried and lost to the world, and such "goodness" is most likely to enter a little child coming to the sacrament of Baptism.[112] A blessing, also, no less than a curse, is looked upon in the light of material energy; goodness is not required for the acquisition of it, mere contact will do. Blessings are hereditary:--"The just man walketh in his integrity: his children are blessed after him."[113]

[Footnote 110: _Catechism of the Council of Trent_, ii. 5. 72.]

[Footnote 111: _Am Urquell_, ii. 101.]

[Footnote 112: Peacock, 'Executed Criminals and Folk-Medicine,' in _Folk-Lore_, vii. 280.]

[Footnote 113: _Proverbs_, xx. 7.]

It is no doubt more becoming for a god to pardon the sinner on account of the merits of the virtuous, than to punish the innocent for the sins of the wicked. It shows that his compassion overcomes his wrath; and the mercy of the deity is, among all divine attributes, that on which the higher monotheistic religions lay most stress. Allah said, "Whoso doth one good act, for him are ten rewards, and I also give more to whomsoever I will; and whoso doth ill, its retaliation is equal to it, or else I forgive him."[114] Nevertheless, the moral consciousness of a higher type can hardly approve that the wicked should be pardoned for the sake of the virtuous, or that the reward for an act should be bestowed upon anybody else than the agent. The doctrine of vicarious merit or recompense is not just; it involves that badness is unduly ignored; it is based on crude ideas of goodness and merit. The theory of _opera supererogativa_, as we have seen, attaches badness {99} and goodness to external acts rather than to mental facts, and assumes that reparation can be given for badness, whereas the scrutinising moral judge only forgives badness in case it is superseded by repentance. If thus a bad act cannot be compensated by a good one, even though both be performed by one and the same person, it can still less be compensated by the good act of another man. From various quarters we hear protests against the notion of vicarious merit--protests which emphasise the true direction of moral reward. Ezekiel, who reproved the old idea that the children's teeth are set on edge because the fathers have eaten sour grapes, also taught that a wicked son is to reap no benefit from the blessings bestowed upon a righteous father.[115] "Fear the day," says the Koran, "wherein no soul shall pay any recompense for another soul."[116] The Buddhistic Dhammapada contains the following passage, which sums up our whole argument:--"By oneself the evil is done, by oneself one suffers; by oneself evil is left undone, by oneself one is purified. The pure and the impure stand and fall by themselves, no one can purify another."[117]

CHAPTER IV

THE NATURE OF THE MORAL EMOTIONS (_concluded_)

WE have seen that moral disapproval is a form of resentment, and that moral approval is a form of retributive kindly emotion. It still remains for us to examine in what respects these emotions differ from kindred non-moral emotions--disapproval from anger and revenge, approval from gratitude--in other words, what characterises them as specifically _moral_ emotions.

It is a common opinion, held by all who regard the intellect as the source of moral concepts, that moral emotions only arise in consequence of moral judgments, and that, in each case, the character of the emotion is determined by the predicate of the judgment. We are told that, when the intellectual process is completed, when the act in question is definitely classed under such or such a moral category, then, and only then, there follows instantaneously a feeling of either approbation or disapprobation as the case may be.[1] When we hear of a murder, for instance, we must discern the wrongness of the act before we can feel moral indignation at it.

[Footnote 1: Fleming, _Manual of Moral Philosophy_, p. 97 _sqq._ Fowler, _Principles of Morals_, ii. 198 _sqq._]

It is true that a moral judgment may be followed by a moral emotion, that the finding out the tendency of a certain mode of conduct to evoke indignation or approval is apt to call forth such an emotion, if there was none before, or otherwise to increase the one existing. It is, moreover, true that the predicate of a moral judgment, as {101} well as the generalisation leading up to such a predicate, may give a specific colouring to the approval or disapproval which it produces, quite apart from the general characteristics belonging to that emotion in its capacity of a moral emotion; the concepts of duty and justice, for instance, no doubt have a peculiar flavour of their own. But for all this, moral emotions cannot be described as resentment or retributive kindliness called forth by moral judgments. Such a definition would be a meaningless play with words. Whatever emotions may follow moral judgments, such judgments could never have been pronounced unless there had been moral emotions antecedent to them. Their predicates, as was pointed out above, are essentially based on generalisations of tendencies in certain phenomena to arouse moral emotions; hence the criterion of a moral emotion can in no case depend upon its proceeding from a moral judgment. But at the same time moral judgments, being definite expressions of moral emotions, naturally help us to discover the true nature of these emotions.

The predicate of a moral judgment always involves a notion of disinterestedness. When pronouncing an act to be good or bad, I mean that it is so, quite independently of any reference it might have to my own interests. A moral judgment may certainly have a selfish motive; but then it, nevertheless, pretends to be disinterested, which shows that disinterestedness is a characteristic of moral concepts as such. This is admitted even by the egoistic hedonist, who maintains that we approve and condemn acts from self-love. According to Helvetius, it is the love of consideration that a virtuous man takes to be in him the love of virtue; and yet everybody pretends to love virtue for its own sake, "this phrase is in every one's mouth and in no one's heart."[2]

[Footnote 2: Helvetius, _De l'Homme_, i. 263.]

If the moral concepts are essentially generalisations of tendencies in certain phenomena to call forth moral emotions, and, at the same time, contain the notion of {102} disinterestedness, we must conclude that the emotions from which they spring are felt disinterestedly. Of this fact we find an echo--more or less faithful--in the maxims of various ethical theorisers, as well as practical moralists. We find it in the utilitarian demand that, in regard to his own happiness and that of others, an agent should be "as strictly impartial as a disinterested and benevolent spectator";[3] in the "rule of righteousness" laid down by Samuel Clarke, that "We so deal with every man, as in like circumstances we could reasonably expect he should with us";[4] in Kant's formula, "Act only on that maxim which thou canst at the same time will to become a universal law";[5] in Professor Sidgwick's so-called axiom, "I ought not to prefer my own lesser good to the greater good of another";[6] in the biblical sayings, "Thou shalt love thy neighbour as thyself,"[7] and, "Whatsoever ye would that men should do to you, do ye even so to them."[8] The same fact is expressed in the Indian Mahabharata, where it is said:--"Let no man do to another that which would be repugnant to himself; this is the sum of righteousness; the rest is according to inclination. In refusing, in bestowing, in regard to pleasure and to pain, to what is agreeable and disagreeable, a man obtains the proper rule by regarding the case as like his own."[9] Similar words are ascribed to Confucius.[10] When Tsze-kung asked if there is any one word which may serve as a rule of practice for all one's life, the Master answered, "Is not Reciprocity such a word? What you do not want done to yourself, do not do to {103} others." And in another utterance Confucius showed that the rule had for him not only a negative, but a positive form. He said that, in the way of the superior man, there are four things to none of which he himself had as yet attained; to serve his father as he would require his son to serve him, to serve his prince as he would require his minister to serve him, to serve his elder brother as he would require his younger brother to serve him, and to set the example in behaving to a friend as he would require the friend to behave to him.[11]

[Footnote 3: Stuart Mill, _Utilitarianism_, p. 24.]

[Footnote 4: Clarke, _Discourse concerning the Unchangeable Obligations of Natural Religion_, p. 201.]

[Footnote 5: Kant, _Grundlegung zur Metaphysik der Sitten_, sec. 2 (_Sämmtliche Werke_, iv. 269).]

[Footnote 6: Sidgwick, _Methods of Ethics_, p. 383. However, as we have seen above, this so-called "axiom" is not a correct representation of the disinterestedness of moral emotions.]

[Footnote 7: _Leviticus_, xix. 18. _St. Matthew_, xxii. 39.]

[Footnote 8: _St. Matthew_, vii. 12. _Cf._ _St. Luke_, vi. 31.]

[Footnote 9: _Mahabharata_, xiii. 5571 _sq._, in Muir, _Religious and Moral Sentiments, rendered from Sanskrit Writers_, p. 107. _Cf._ _Panchatantra_, iii. (Benfey's translation, ii. 235).]

[Footnote 10: _Lun Yü_, xv. 23. _Cf._ _ibid._ xii. 2; _Chung Yung_, xiii. 3.]

[Footnote 11: _Chung Yung_, xiii. 4.]

This "golden rule" is not, as has been sometimes argued, a rule of retaliation.[12] It does not say, "Do to others what they wish to do to you"; it says, "Do to others what you wish, or require, them to do to you." It brings home to us the fact that moral rules are general rules, which ought to be obeyed irrespectively of any selfish considerations. If formulated as an injunction that we should treat our neighbour in the same manner as we consider that he, under exactly similar circumstances, ought to treat us, it is simply identical with the sentence, "Do your duty," with emphasis laid on the disinterestedness which is involved in the very conception of duty. So far, St. Augustine was right in saying that "Do as thou wouldst be done by" is a sentence which all nations under heaven are agreed upon.[13]

[Footnote 12: Letourneau, _L'évolution religieuse dans les diverses races humaines_, p. 553.]

[Footnote 13: St. Augustine, quoted by Lilly, _Right and Wrong_, p. 106.]

Disinterestedness, however, is not the only characteristic by which moral indignation and approval are distinguished from other, non-moral, kinds of resentment or retributive kindly emotion. It is, indeed, itself a form of a more comprehensive quality which characterises moral emotions--apparent impartiality. If I pronounce an act done to a friend or to an enemy to be either good or bad, that implies that I assume it to be so independently of the fact that the person to whom the act is done is my friend or my enemy. Conversely, if I pronounce an {104} act done by a friend or by an enemy to be good or bad, that implies that I assume the act to be either good or bad independently of my friendly or hostile feelings towards the agent. All this means that resentment and retributive kindly emotion are moral emotions in so far as they are assumed by those who feel them to be uninfluenced by the particular relationship in which they stand, both to those who are immediately affected by the acts in question, and to those who perform those acts. A moral emotion, then, is tested by an imaginary change of the relationship between him who approves or disapproves of the mode of conduct by which the emotion was evoked and the parties immediately concerned, whilst the relationship between the parties themselves is left unaltered. At the same time it is not necessary that the moral emotion should be really impartial. It is sufficient that it is tacitly assumed to be so, nay, even that it is not knowingly partial. In attributing different rights to different individuals, or classes of individuals, we are often, in reality, influenced by the relationship in which we stand to them, by personal sympathies and antipathies; and yet those rights may be moral rights, in the strict sense of the term, not mere preferences, namely, if we assume that any impartial judge would recognise our attribution of rights as just, or even if we are unaware of its partiality. Similarly, when the savage censures a homicide committed upon a member of his own tribe, but praises one committed upon a member of another tribe, his censure and praise are certainly influenced by his relations to the victim, or to the agent, or to both. He does not reason thus: it is blamable to kill a member of one's own tribe, and it is praiseworthy to kill a member of a foreign tribe--whether the tribe be mine or not. Nevertheless, his blame and his praise must be regarded as expressions of moral emotions.

Finally, a moral emotion has a certain flavour of generality. We have previously noticed that a moral judgment very frequently implies some vague assumption {105} that it must be shared by everybody who possesses both a sufficient knowledge of the case and a "sufficiently developed" moral consciousness. We have seen, however, that this assumption is illusory. It cannot, consequently, be regarded as a _conditio sine quâ non_ for a moral judgment, unless, indeed, it be maintained that such a judgment, owing to its very nature, is necessarily a chimera--an opinion which, to my mind, would be simply absurd. But, though moral judgments cannot lay claim to universality or "objectivity," it does not follow that they are merely individual estimates. Even he who fully sees their limitations must admit that, when he pronounces an act to be good or bad, he gives expression to something more than a personal opinion, that his judgment has reference, not only to his own feelings, but to the feelings of others as well. And this is true even though he be aware that his own conviction is not shared by those around him, nor by anybody else. He then feels that it _would be_ shared if other people knew the act and all its attendant circumstances as well as he does himself, and if, at the same time, their emotions were as refined as are his own. This feeling gives to his approval or indignation a touch of generality, which belongs to public approval and public indignation, but which is never found in any merely individual emotion of gratitude or revenge.

* * * * *

The analysis of the moral emotions which has been attempted in this and the two preceding chapters, holds good, not only for such emotions as we feel on account of the conduct of others, but for such emotions as we feel on account of our own conduct as well. Moral self-condemnation is a hostile attitude of mind towards one's self as the cause of pain, moral self-approval is a kindly attitude of mind towards one's self as a cause of pleasure. Genuine remorse, though focussed on the will of the person who feels it, involves, vaguely or distinctly, some desire to suffer. The repentant man wants to think of the wrong he has committed, he wants clearly to realise {106} its wickedness; and he wants to do this, not merely because he desires to become a better man, but because it gives him some relief to feel the sting in his heart. If punished for his deed, he willingly submits to the punishment. The Philippine Islander, says Mr. Foreman, if he recognises a fault by his own conscience, will receive a flogging without resentment or complaint, although, "if he is not so convinced of the misdeed, he will await his chance to give vent to his rancour."[14] We may feel actual hatred towards ourselves, we may desire to inflict bodily suffering upon ourselves as a punishment for what we have done;[15] nay, there are instances of criminals, guilty of capital offences, having given themselves up to the authorities in order to appease their consciences by suffering the penalty of the law.[16] Yet the desire to punish ourselves has a natural antagonist in our general aversion to pain, and this often blunts the sting of the conscience. Suicide prompted by remorse, which sometimes occurs even among savages,[17] is to be regarded rather as a method of putting an end to agonies, than as a kind of self-execution; and behind the self-torments of the sinner frequently lurks the hopeful prospect of heavenly bliss. Self-approval, again, is not merely joy at one's own conduct, but is a kindly emotion, a friendly attitude towards one's self. Such an attitude, for instance, lies at the bottom of the feeling that one's own conduct merits praise or reward.

[Footnote 14: Foreman, _Philippine Islands_, p. 185. _Cf._ Hinde, _The Last of the Masai_, p. 34; Zöller, _Das Togoland_, p. 37.]

[Footnote 15: _Cf._ Jodl, _Lehrbuch der Psychologie_, p. 675.]

[Footnote 16: von Feuerbach, _Aktenmässige Darstellung merkwürdiger Verbrechen_, i. 249; ii. 473, 479 _sq._ von Lasaulx, _Sühnopfer der Griechen und Römer_, p. 6.]

[Footnote 17: See _infra_, on Suicide.]

Not every form of self-reproach or of self-approval is a moral emotion--no more than is every form of resentment or retributive kindly emotion towards other persons. We may be angry with ourselves on account of some act of ours which is injurious to our own interests. He who has lost at play may be as vexed at himself as he who has {107} cheated at play, and the egoist may bitterly reproach himself for having yielded to a momentary impulse of benevolence, or even to conscience itself. In order to be moral emotions, our self-condemnation and self-approval must present the same characteristics as make resentment and retributive kindliness moral emotions when they are felt with reference to the conduct of other people. A person does not feel remorse when he reproaches himself from an egoistic motive, or when he afterwards regrets that he has sacrificed the interests of his children to the impartial claim of justice. Nor does a person feel moral self-approval when he is pleased with himself for having committed an act which he recognises as selfish or unjust. And besides being disinterested and apparently impartial, remorse and moral self-approval have a flavour of generality. As Professor Baldwin remarks, moral approval or disapproval, not only of other people, but of one's self, "is never at its best except when it is accompanied, in the consciousness which has it, with the knowledge or belief that it is also socially shared."[18] Indeed, almost inseparable from the moral judgments which we pass on our own conduct seems to be the image of an impartial outsider who acts as our judge.

[Footnote 18: Baldwin, _Social and Ethical Interpretation in Mental Development_, p. 314.]

CHAPTER V

THE ORIGIN OF THE MORAL EMOTIONS

WE have found that resentment and retributive kindly emotion are easily explicable from their usefulness, both of them having a tendency to promote the interests of the individuals who feel them. This explanation also holds good for the moral emotions, in so far as they are retributive emotions: it accounts for the hostile attitude of moral disapproval towards the cause of pain, and for the friendly attitude of moral approval towards the cause of pleasure. But it still remains for us to discover the origin of those elements in the moral emotions by which they are distinguished from other, non-moral, retributive emotions. First, how shall we explain their disinterestedness?

We have to distinguish between different classes of conditions under which disinterested retributive emotions arise. In the first place, we may feel disinterested resentment, or disinterested retributive kindly emotion, on account of an injury inflicted, or a benefit conferred, upon another person with whose pain, or pleasure, we sympathise, and in whose welfare we take a kindly interest. Our retributive emotions are, of course, always reactions against pain, or pleasure, felt by ourselves; this holds true for the moral emotions as well as for revenge and gratitude. The question to be answered, then, is, Why should we, quite disinterestedly, feel pain calling forth indignation because our neighbour is hurt, and pleasure calling forth approval because he is benefited?

{109} That a certain act causes pleasure or pain to the by-stander is partly due to the close association which exists between these feelings and their outward expressions. The sight of a happy face tends to produce some degree of pleasure in him who sees it; the sight of the bodily signs of suffering tends to produce a feeling of pain. In either case the feeling of the spectator is the result of a process of reproduction, the perception of the physical manifestation of the feeling recalling the feeling itself on account of the established association between them.

Sympathetic pain or pleasure may also be the result of an association between cause and effect, between the cognition of a certain act or situation and the feeling generally produced by this act or situation. A blow may cause pain to the spectator before he has witnessed its effect on the victim. The sympathetic feeling is of course stronger when both kinds of association concur in producing it, than when it is the result of only one. As Adam Smith observes, "general lamentations which express nothing but the anguish of the sufferer, create rather a curiosity to inquire into his situation, along with some disposition to sympathise with him, than any actual sympathy that is very sensible."[1] On the other hand, the sympathy which springs from an association between cause and effect is much enhanced by the perception of outward signs of pleasure or pain in the individual with whom we sympathise.

[Footnote 1: Adam Smith, _Theory of Moral Sentiments_, p. 7.]

But the sympathetic feeling which results from association alone is not what is generally understood by sympathy. Arising merely from the habitual connection of certain cognitions with certain feelings in the experience of the spectator, it is, strictly speaking, not at all concerned with the _feelings_ of the other person. It is not a reflex of what he feels--which, indeed, is a matter of complete indifference--and the activity which it calls forth is thoroughly selfish. If it is a feeling of pain, the spectator naturally, for his own sake, tries to get rid of it; but this {110} may be done by turning the back upon the sufferer, and looking out for some diversion. The sympathetic feeling which springs from association alone, may also produce a benevolent or hostile reaction against its immediate cause: the smiling face often evokes a kindly feeling towards the smiler, and "the sight of suffering often directs irritation against the sufferer."[2] In such cases it is the other person himself, rather than his benefactor or his tormentor, that is regarded as cause by the sympathiser. When based on association alone, the sympathetic feeling thus lacks the most vital characteristic of sympathy, in the popular sense of the term: it lacks kindliness.[3]

[Footnote 2: Leslie Stephen, _Science of Ethics_, p. 243.]

[Footnote 3: The difference between sympathy and kindly ("tender") emotion has been commented upon by Professor Ribot (_Psychology of the Emotions_, p. 233), and by Mr. Shand, in his excellent chapter on the 'Sources of Tender Emotion,' in Stout's _Groundwork of Psychology_, p. 198 _sqq._]

Sympathy, in the ordinary use of the word, requires the co-operation of the altruistic sentiment or affection--a disposition of mind which is particularly apt to display itself as kindly emotion towards other beings. This sentiment,[4] only, induces us to take a kindly interest in the feelings of our neighbours. It involves a tendency, or willingness, and, when strongly developed, gives rise to an eager desire, to sympathise with their pains and pleasures. Under its influence, our sympathetic feeling is no longer a mere matter of association; we take an active part in its production, we direct our attention to any circumstance which we believe may affect the feelings of the person whom we love, to any external manifestation of his emotions. We are anxious to find out his joys and sorrows, so as to be able to rejoice with him and to suffer with him, and, especially, when he stands in need of it, to console or to help him. For the altruistic sentiment is not merely willingness to sympathise; it is above all a conative {111} disposition to do good. The latter aptitude must be regarded rather as the cause than as the result of the former; affection is not, as Adam Smith maintained,[5] merely habitual sympathy, or its necessary consequence. It is true that sympathetic pain, unaided by kindliness, may induce a person to relieve the suffering of his neighbour, instead of shutting his eyes to it; but then he does so, not out of regard to the feelings of the sufferer, but simply to free himself of a painful cognition. Nor must it be supposed that the altruistic sentiment prompts to assistance only by strengthening the sympathetic feeling. The sight of the wounded traveller may have caused no less pain to the Pharisee than to the good Samaritan; yet it would have been impossible for the Samaritan to dismiss his pain by going

away, since he felt a desire to assist the wounded, and his desire would have been left ungratified if he had not stopped by the wayside. To the egoist, the relief offered to the sufferer is a means of suppressing the sympathetic pain; to the altruist, the sympathetic pain is, so to say, a means of giving relief. The altruist wants to know, to feel the pain of his neighbour, because he desires to help him. Why are the most kind-hearted people often the most cheerful, if not because they think of alleviating the misery of their fellow-creatures, instead of indulging in the sympathetic pain which it evokes?

[Footnote 4: I use the word "sentiment" in the sense proposed by Mr. Shand, in his article, 'Character and the Emotions,' in _Mind_, N.S. v. 203 _sqq._, and adopted by Professor Stout, _op. cit._ p. 221 _sqq._ Sentiments cannot be actually felt at any one moment; "they are complex mental dispositions, and may, as divers occasions arise, give birth to the whole gamut of the emotions" (_ibid._ p. 223 _sq._).]

[Footnote 5: Adam Smith, _op. cit._ p. 323.]

It is obvious, then, that sympathy aided by the altruistic sentiment--sympathy in the common sense--tends to produce disinterested retributive emotions. When we to some extent identify, as it were, our feelings with those of our neighbour, we naturally look upon any person who causes him pleasure or pain as the cause of our sympathetic pleasure or pain, and are apt to experience towards that person a retributive emotion similar in kind, if not always in degree, to the emotion which we feel when we are ourselves benefited or injured. In all animal species which possess altruistic sentiments in some form or other, we may be sure to find sympathetic resentment as their accompaniment. {112} A mammalian mother is as hostile to the enemy of her young as to her own enemy. Among social animals whose gregarious instinct has developed into social affection,[6] sympathetic resentment is felt towards the enemy of any member of the group; they mutually defend each other, and this undoubtedly involves some degree of sympathetic anger. With reference to animals in confinement and domesticated animals, many striking instances of this emotion might be quoted, even in cases when injuries have been inflicted on members of different species to which they have become attached. Professor Romanes' terrier, "whenever or wherever he saw a man striking a dog, whether in the house, or outside, near at hand or at a distance, ... used to rush in to interfere, snarling and snapping in a most threatening way."[7] Darwin makes mention of a little American monkey in the Zoological Gardens of London which, when seeing a great baboon attack his friend, the keeper, rushed to the rescue and by screams and bites so distracted the baboon, that the man was able to escape.[8] The dog who flies at any one who strikes, or even touches, his master, is a very familiar instance of sympathetic resentment. The Rev. Charles Williams mentions a dog at Liverpool who saved a cat from the hands of some young ruffians who were maltreating it: he rushed in among the boys, barked furiously at them, terrified them into flight, and carried the cat off in his mouth, bleeding and almost senseless, to his kennel, where he laid it on the straw, and nursed it.[9] In man, sympathetic resentment begins at an early age. Professor Sully mentions a little boy under four who was indignant at any picture where an animal suffered.[10]

[Footnote 6: The connection between social affection and the gregarious instinct will be discussed in a subsequent chapter.]

[Footnote 7: Romanes, _Animal Intelligence_, p. 440.]

[Footnote 8: Darwin, _Descent of Man_, p. 103. _Cf._ Fisher, in _Revue Scientifique_, xxxiii. 618. A curious instance of a terrier "avenging" the death of another terrier, his inseparable friend, is mentioned by Captain Medwin (_Angler in Wales_, ii. 162-164, 197, 216 _sq._).]

[Footnote 9: Williams, _Dogs and their Ways_, p. 43.]

[Footnote 10: Sully, _Studies of Childhood_, p. 250.]

The altruistic sentiments of mankind will be treated at {113} length in subsequent chapters. We shall find reason to believe that not only maternal, but to some extent, paternal and conjugal affection, prevailed in the human race from ancient times, and that social affection arose in those days when the conditions of life became favourable to an expansion of the early family, when the chief obstacle to a gregarious life--scarcity of food--was overcome, and sociality, being an advantage to man, became his habit. There are still savages who live in families rather than in tribes, but we know of no people among whom social organisation outside the family is totally wanting. Later discoveries only tend to confirm Darwin's statement that, though single families or only two or three together, roam the solitudes of some savage lands, they always hold friendly relations with other families inhabiting the same district; such families occasionally meeting in council and uniting for their common defence.[11] But as a general rule, to which there are few exceptions, the lower races live in communities larger than family groups, and all the members of the community are united with one another by common interests and common feelings. Of the harmony, mutual good-will, and sense of solidarity,

which under normal conditions prevail in these societies, much evidence will be adduced in following pages. Mr. Melville's remark with reference to some Marquesas cannibals may be quoted as to some extent typical. "With them," he says, "there hardly appeared to be any difference of opinion upon any subject whatever. . . . They showed this spirit of unanimity in every action of life: everything was done in concert and good fellowship."[12] When a member of the group is hurt, the feeling of unanimity takes the form of public resentment. As Robertson observed long ago, "in small communities, every man is touched with the injury or affront offered to the body of which he is a member, as if it were a personal attack upon his own honour or safety. The desire of revenge is communicated from breast to breast, {114} and soon kindles into rage."[13] Speaking of some Australian savages, Mr. Fison remarks:--"To the savage, the whole gens is the individual, and he is full of regard for it. Strike the gens anywhere, and every member of it considers himself struck, and the whole body corporate rises up in arms against the striker."[14] Nobody will deny that there is a disinterested element in this public resentment, even though every member of the group consider the enemy of any other member to be actually his own enemy as well, and, partly, hate him as such.

[Footnote 11: Darwin, _op. cit._ p. 108.]

[Footnote 12: Melville, _Typee_, p. 297 _sq._]

[Footnote 13: Robertson, _History of America_, i. 350. _Cf._ Clifford's theory of the "tribal self" (_Lectures and Essays_, p. 290 _sqq._). He says (_ibid._ p. 291), "The savage is not only hurt when anybody treads on his foot, but when anybody treads on his tribe."]

[Footnote 14: Fison and Howitt, _Kamilaroi and Kurnai_, p. 170.]

Our explanation of what has here been called "sympathetic resentment," however, is not yet complete. This emotion, as we have seen, may be a reaction against sympathetic pain; but it may also be directly produced by the cognition of the signs of anger. In the former case it is, strictly speaking, independent of the _emotion_ of the injured individual; we may feel resentment on his behalf though he himself feels none. In the latter case it is a reflected emotion, felt independently of the cause of the original emotion of which it is a reflection--as when the yells and shrieks of a street dog-fight are heard, and dogs from all sides rush to the spot, each dog being apparently ready to bite any of the others. In the former case, it is, by the medium of sympathetic pain, closely connected with the inflicted injury; in the latter case it may even be the reflection of an emotion which is itself sympathetic, and the origin of which is perhaps out of sight. In an infuriated crowd the one gets angry because the other is angry, and very often the question, Why? is hardly asked. This form of sympathetic resentment is of considerable importance both as an originator and as a communicator of moral ideas. To teach that a certain act is wrong is to teach that it is an object, and a proper object, of moral indignation, and the aim of the instructor {115} is to inspire a similar indignation in the mind of the pupil. An intelligent teacher tries to attain this end by representing the act in such a light as to evoke disapproval independently of any appeal to authority; but, unfortunately, in many cases where the duties of current morality are to be enjoined, he cannot do so--for a very obvious reason. Of various acts which, though inoffensive by themselves, are considered wrong, he can say little more than that they are forbidden by God and man; and if, nevertheless, such acts are not only professed, but actually felt, to be wrong, that is due to the fact that men are inclined to sympathise with the resentment of persons for whom they feel regard. It is this fact that accounts for the connection between the punishment of an act and the consequent idea that it deserves to be punished. We shall see that the punishment which society inflicts is, as a rule, an expression of its moral indignation; but there are instances in which the order is reversed, and in which human, or, as it may be supposed, divine, punishment or anger is the cause, and moral disapproval the effect. Children, as everybody knows, grow up with their ideas of right and wrong graduated, to a great extent, according to the temper of the father or mother;[15] and men are not seldom, as Hobbes said, "like little children, that have no other rule of good and evill manners, but the correction they receive from their Parents, and Masters."[16] The case is the same with any outbreak of public resentment, with any punishment inflicted by society at large. However selfish it may be in its origin, to whatever extent it may spring from personal motives, it always has a tendency to become in some degree disinterested, each individual not only being angry on his own behalf, but at the same time reflecting the anger of everybody else.

[Footnote 15: _Cf._ Baring-Gould, _Origin and Developwent of Religious Belief_, i. 212.]

[Footnote 16: Hobbes, _Leviathan_, i. 2, p. 76.]

Any means of expressing resentment may serve as a communicator of the emotion. Besides punishment, language deserves special mention. Moral disapproval may {116} be evoked by the very sounds of certain words, like "murder," "theft," "cowardice," and others, which not merely indicate the commission of certain acts, but also express the opprobrium attached to them. By being

called a "liar," a person is more disgraced than by any plain statement of his untruthfulness; and by the use of some strong word the orator raises the indignation of a sympathetic audience to its pitch.

All the cases of disinterested resentment which we have hitherto considered fall under the heading of sympathetic resentment. But there are other cases into which sympathy does not enter at all. Resentment is not always caused by the infliction of an injury; it may be called forth by any feeling of pain traceable to a living being as its direct or indirect cause. Quite apart from our sympathy with the sufferings of others, there are many cases in which we feel hostile towards a person on account of some act of his which in no way interferes with our interests, which conflicts with no self-regarding feeling of ours. There are in the human mind what Professor Bain calls "disinterested antipathies," sentimental aversions "of which our fellow-beings are the subjects, and on account of which we overlook our own interest quite as much as in displaying our sympathies and affections."[17] Differences of taste, habit, and opinion, are particularly apt to create similar dislikes, which, as will be seen, have played a very prominent part in the moulding of the moral consciousness. When a certain act, though harmless by itself (apart from the painful impression it makes upon the spectator), fills us with disgust or horror, we may feel no less inclined to inflict harm upon the agent, than if he had committed an offence against person, property, or good name. And here, again, our resentment is sympathetically increased by our observing a similar disgust in others. We are easily affected by the aversions and likings of our neighbours. As Tucker said, "we grow to love things we perceive {117} them fond of, and contract aversions from their dislikes."[18]

[Footnote 17: Bain, _Emotions and the Will_, p. 268.]

[Footnote 18: Tucker, _Light of Nature Pursued_, i. 154.]

We have already seen that sympathy springing from an altruistic sentiment may produce, not only disinterested resentment, but disinterested retributive kindly emotion as well. When taking a pleasure in the benefit bestowed on our neighbour, we naturally look with kindness upon the benefactor; and just as sympathetic resentment may be produced by the cognition of the outward signs of resentment, so sympathetic retributive kindly emotion may be produced by the signs of retributive kindliness. Language communicates emotions by terms of praise, as well as by terms of condemnation; and a reward, like a punishment, tends to reproduce the emotion from which it sprang. Moreover, men have disinterested likings, as they have disinterested dislikes. As an instance of such likings may be mentioned the common admiration of courage when felt irrespectively of the object for which it is displayed.

Having thus found the origin of disinterested retributive emotions, we have at the same time partly explained the origin of the moral emotions. But, as we have seen, disinterestedness is not the sole characteristic by which moral indignation and approval are distinguished from other retributive emotions: a moral emotion is assumed to be impartial, or, at least, is not knowingly partial, and it is coloured by the feeling of being publicly shared. However, the real problem which we have now to solve is not how retributive emotions may become apparently impartial and be coloured by a feeling of generality, but why disinterestedness, apparent impartiality, and the flavour of generality have become characteristics by which so-called moral emotions are distinguished from other retributive emotions. The solution of this problem lies in the fact that society is the birthplace of the moral consciousness; that the first moral judgments expressed, not the private emotions of isolated individuals, but emotions which were {118} felt by the society at large; that tribal custom was the earliest rule of duty.

Customs have been defined as public habits, as the habits of a certain circle, a racial or national community, a rank or class of society. But whilst being a habit, custom is at the same time something else as well. It not merely involves a frequent repetition of a certain mode of conduct, it is also a rule of conduct. As Cicero observes, the customs of a people "are precepts in themselves."[19] We say that "custom commands," or "custom demands," and speak of it as "strict" and "inexorable"; and even when custom simply allows the commission of a certain class of actions, it implicitly lays down the rule that such actions are not to be interfered with.

[Footnote 19: Cicero, _De Officiis_, i. 41.]

The rule of custom is conceived of as a moral rule, which decides what is right and wrong.[20] "Les loix de la conscience," says Montaigne, "que nous disons naistre de nature, naissent de la coustume."[21] Mr. Howitt once said to a young Australian native with whom he was speaking about the food prohibited during initiation, "But if you were hungry and caught a female opossum, you might eat it if the old men were not there." The youth replied, "I could not do that; it would not be right"; and he could give no other reason than that it would be wrong to disregard the customs of his people.[22] Mr. Bernau says of the British Guiana Indians:--"Their moral sense of good and evil is entirely regulated by the customs and practices inherited from their forefathers. What their predecessors believed and did must have been right, and they deem it the height of presumption to suppose that any

could think and act otherwise."[23] The moral evil of the pagan Greenlanders "was all that was contrary to laws and customs, as {119} regulated by the angakoks," and when the Danish missionaries tried to make them acquainted with their own moral conceptions, the result was that they "conceived the idea of virtue and sin as what was pleasing or displeasing to Europeans, as according or disaccording with their customs and laws."[24] "The Africans, like most heathens," Mr. Rowley observes, "do not regard sin, according to their idea of sin, as an offence against God, but simply as a transgression of the laws and customs of their country."[25] The Ba-Ronga call derogations of universally recognised custom _yila_, prohibited, tabooed.[26] The Bedouins of the Euphrates "make no appeal to conscience or the will of God in their distinctions between right and wrong, but appeal only to custom."[27] According to the laws of Manu, the custom handed down in regular succession since time immemorial "is called the conduct of virtuous men."[28] The Greek idea of the customary, [Greek: to\ no/mimon], shows the close connection between morality and custom; and so do the words [Greek: e)/thos, ê)/thos], and [Greek: e)thika/], the Latin _mos_ and _moralis_, the German _Sitte_ and _Sittlichkeit_.[29] Moreover, in early society, customs are not only moral rules, but the only moral rules ever thought of. The savage strictly complies with the Hegelian command that no man must have a private conscience. The following statement, which refers to the Tinnevelly Shanars, may be quoted as a typical example:--"Solitary individuals amongst them rarely adopt any new opinions, or any new course of procedure. They follow the multitude to do evil, and they follow the multitude to do good. They think in herds."[30]

[Footnote 20: _Cf._ Austin, _Lectures on Jurisprudence_, i. 104; Tönnies, 'Philosophical Terminology,' in _Mind_, N.S., viii. 304. Von Jhering (_Zweck im Recht_, ii. 23) defines the German _Sitte_ as "die im Leben des Volks sich bildende verpflichtende Gewohnheit"; and a similar view is expressed by Wundt (_Ethik_, p. 128 _sq._).]

[Footnote 30: Caldwell, _Tinnevelly Shanars_, p. 69.]

Disobedience to custom evokes public indignation. In {120} the lower stages of civilisation, especially, custom is a tyrant who binds man in iron fetters, and who threatens the transgressor, not only with general disgrace, but often with bodily suffering. "To believe that man in a savage state is endowed with freedom either of thought or action," says Sir G. Grey, "is erroneous in the highest degree";[31] and this statement is corroborated by an array of facts from all quarters of the savage world.[32] Now, as the rule of custom is a moral rule, the indignation aroused by its transgression is naturally a moral emotion. Moreover, where all the duties incumbent on a man are expressed in the customs of the society to which he belongs, it is obvious that the characteristics of moral indignation are to be sought for in its connection with custom. The most salient feature of custom is its generality. Its transgression calls forth public indignation; hence the flavour of generality which characterises moral disapproval. Custom is fixed once for all, and takes no notice of the preferences of individuals. By recognising the validity of a custom, I implicitly admit that the custom is equally binding for me and for you and for all the other members of the society. This involves disinterestedness; I admit that a breach of the custom is equally wrong whether I myself am immediately concerned in the act or not. It also involves apparent impartiality; I assume that my condemnation of the act is independent of the relationship in which the parties concerned in it stand to me personally, or, at least, I am not aware that my condemnation is influenced by any {121} such relationship. And this holds good whatever be the origin of the custom. Though customs are very frequently rooted in public sympathetic resentment or in

public disinterested aversions, they may have a selfish and partial origin as well. At first the leading men of the society may have prohibited certain acts because they found them disadvantageous to themselves, or to those with whom they particularly sympathised. Where custom is an oppressor of women, this oppression may certainly be traced back to the selfishness of men. Where custom sanctions slavery, it is certainly not impartial to the slaves. Yet in the one case as in the other, I assume custom to be in the right, irrespectively of my own station, and I even expect the women and slaves themselves to be of the same opinion. Such an expectation is by no means a chimera. Under normal social conditions, largely owing to men's tendency to share sympathetically the resentment of their superiors, the customs of a society are willingly submitted to, and recognised as right, by the large majority of its members, whatever may be their station. Among the Rejangs of Sumatra, says Marsden, "a man without property, family, or connections, never, in the partiality of self-love, considers his own life as being of equal value with that of a man of substance."[33] However selfish, however partial a certain rule may be, it becomes a true custom, a moral rule, as soon as the selfishness or the partiality of its makers is lost sight of.

[Footnote 33: Marsden, _History of Sumatra_, p. 247.]

It will perhaps be argued that, by deriving the characteristics of moral indignation from its connection with custom, we implicitly contradict our initial assumption that moral emotions lie at the bottom of all moral judgments. But it is not so. Custom is a moral rule only on account of the indignation called forth by its transgression. In its ethical aspect it is nothing but a generalisation of emotional tendencies, applied to certain modes of conduct, and transmitted from generation to generation. Public indignation lies at the bottom of it. In its capacity {122} of a rule of duty, custom, _mos_, is derived from the emotion to which it gave its name.

As public indignation is the prototype of moral disapproval, so public approval, expressed in public praise, is the prototype of moral approval. Like public indignation, public approval is characterised by a flavour of generality, by disinterestedness, by apparent impartiality. But of these two emotions public indignation, being at the root of custom and leading to the infliction of punishment, is by far the more impressive. Hence it is not surprising that the term "moral" is etymologically connected with _mos_, which always implies the existence of a social rule the transgression of which evokes public indignation. Only by analogy it has come to be applied to the emotion of approval as well.

Though taking their place in the system of human emotions as public emotions felt by the society at large, moral disapproval and approval have not always remained inseparably connected with the feelings of any special society. The unanimity of opinion which originally characterised the members of the same social unit was disturbed by its advancement in civilisation. Individuals arose who found fault with the moral ideas prevalent in the community to which they belonged, criticising those ideas on the basis of their own individual feelings. Such rebels are certainly no less justified in speaking in the name of morality true and proper, than is society itself. The emotions from which their opposition against public opinion springs may be, in nature, exactly similar to the approval or disapproval felt by the society at large, though they are called forth by different facts or, otherwise, differ from these emotions in degree. They may present the same disinterestedness and apparent impartiality--indeed, dissent from the established moral ideas largely rises from the conviction that the apparent impartiality of public feelings is an illusion. As will be seen, the evolution of the moral consciousness involves a progress in impartiality and justice; it tends towards an equalisation {123} of rights, towards an expansion of the circle within which the same moral rules are held applicable; and this process is in no small degree effected by the efforts made by high-minded individuals to raise public opinion to their own standard of right. Nay, as we have already noticed, individual moral feelings do not even lack that flavour of generality which characterises the resentment and approval felt unanimously by a body of men. Though, perhaps, persecuted by his own people as an outcast, the moral dissenter does not regard himself as the advocate of a mere private opinion.[34] Even when standing alone, he feels that his conviction is shared at least by an ideal society, by all those who see the matter as clearly as he does himself, and who are animated with equally wide

sympathies, an equally broad sense of justice. Thus the moral emotions remain to the last public emotions--if not in reality, then as an ideal.

[Footnote 34: _Cf._ Pollock, _Essays in Jurisprudence and Ethics_, p. 309.]

The fact that the earliest moral emotions were public emotions implies that the original form of the moral consciousness cannot, as is often asserted, have been the individual's own conscience. Dr. Martineau's observation, that the inner springs of other men's actions may be read off only by inference from our own experience, by no means warrants his conclusion that the moral consciousness is at its origin engaged in self-estimation, instead of circuitously reaching this end through a prior critique upon our fellow-men.[35] The moral element which may be contained in the emotion of self-reproach or self-approval, is generally to such an extent mixed up with other and non-moral elements, that it can be disentangled only by a careful process of abstraction, guided by the feelings of other people with reference to our conduct or by our own feelings with reference to the conduct of others. The moral emotion of remorse presupposes some notion of right and wrong, and the application of this notion to one's own conduct. Hence it could never have {124} been distinguished as a special form of, or element in, the wider emotion of self-reproach, unless the idea of morality had been previously derived from another source. The similarity between regret and remorse is so close, that in certain European languages there is only one word for both.[36]

[Footnote 35: Martineau, _Types of Ethical Theory_, ii. 29 _sqq._]

[Footnote 36: As, in Swedish, the word _ånger_.]

* * * * *

From what has been said above it is obvious that moral resentment is of extreme antiquity in the human race, nay, that the germ of it is found even in the lower animal world, among social animals capable of feeling sympathetic resentment. The origin of custom as a moral rule no doubt lies in a very remote period of human history. We have no knowledge of a savage people without customs, and, as will be seen subsequently, savages often express their indignation in a very unmistakable manner when their customs are transgressed. Various data prove that the lower races have some feeling of justice, the flower of all moral feelings. And the supposition that remorse is unknown among them,[37] is not only unfounded, but contradicted by facts. Indeed, genuine remorse is so hidden an emotion even among ourselves, that it cannot be expected to be very conspicuous among savages. As we have seen, it requires a certain power of abstraction, as well as great impartiality of feeling, and must therefore be sought for at the highest reaches of the moral consciousness rather than at its lowest degrees. But to suppose that savages are entirely without a conscience is quite contrary to what we may infer from the great regard in which they hold their customs, as also contrary to the direct statements of travellers who have taken some pains to examine the matter. The answer given by the young Australian when asked by Mr. Howitt whether he might not eat a female opossum if the old men were not present,[38] certainly indicates conscientious respect for a moral rule, and is, as Mr. Fison observes, "a striking instance of that 'moral {125} feeling' which Sir John Lubbock denies to savages."[39] Dr. Hübbe-Schleiden asserts that, among the people whom he had in his service, he found the Negroes, in their sense of duty, not inferior, but rather superior to the Europeans.[40] Mr. New says of the Wanika:--"Conscience lives in them as the vicegerent of Almighty God, and is ever excusing or else accusing them. It may be blunted, hardened, resisted, and largely suppressed, but there it is."[41] M. Arbousset once desired some Bechuanas to tell him whether the blacks had a conscience. "Yes, all have one," they said in reply. "And what does it say to them?" "It is quiet when they do well and torments them when they sin." "What do you call sin?" "The theft, which is committed trembling, and the murder from which a man purifies and re-purifies himself, but which always leaves remorse."[42] Mr. Washington Matthews refers to a passage in a Navaho story which "shows us that he who composed this tale knew what the pangs of remorse might be, even for an act not criminal, as we consider it, but merely ungenerous and unfilial."[43]

[Footnote 43: Matthews, 'Study of Ethics among the Lower Races,' in _Journal of American Folk-Lore_, xii. 7.]

A different opinion as to the existence of moral feelings among savages has been expressed by Lord Avebury. To him even modern savages seem to be "almost entirely wanting in moral feeling"; and he says that he has "been forced to this conclusion, not only by the direct statements of travelers but by the general tenor of their remarks, and especially by the remarkable absence of repentance and remorse among the lower races of men."[44] The importance of the subject renders {126} it necessary to scrutinise the facts which Lord Avebury has adduced in support of his conclusion.

[Footnote 44: Avebury, _op. cit._ pp. 414, 426. Lord Avebury quotes Burton's statement that in Eastern Africa, as also among the Yoruba negroes, conscience does not exist, and that "repentance" expresses regret for missed opportunities of mortal crime. Speaking of the stage of savagery represented by the Bakaïri, Dr. von den Steinen likewise observes (_Unter den Naturvölkern Zentral-Brasiliens_, p. 351), "Goodness and badness exist only in the crude sense of doing to others what is agreeable or disagreeable, but the moral consciousness, and the ideal initiative, influenced neither by prospect of reward nor fear of punishment, are entirely lacking." Lippert maintains (_Kulturgeschichte der Menschheit_, i. 27) "dass sich das Gewissen beim Naturmenschen nicht als 'Selbsttadel,' sondern nur als Furcht zeigt."]

Mr. Neighbors states that, among the Comanches of Texas, "no individual action is considered a crime, but every man acts for himself according to his own judgment, unless some superior power--for instance, that of a popular chief--should exercise authority over him." Another writer says, "The Redskin has no moral sense whatever." Among the Basutos, according to Casalis, morality "depends so entirely upon social order that all political disorganisation is immediately followed by a state of degeneracy, which the re-establishment of order alone can rectify." Similar accounts are given as regards Central Africa and some other places. Thus at Jenna, and in the surrounding districts, "whenever a town is deprived of its chief, the inhabitants acknowledge no law--anarchy, troubles, and confusion immediately prevail, and till a successor is appointed all labour is at an end." The Damaras "seem to have no perceptible notion of right or wrong." The Tasmanians were "without any moral views and impressions." Eyre says of the Australians that they have "no moral sense of what is just and equitable in the abstract"; and a missionary had very great difficulty in conveying to those natives any idea of sin. The Kacharis had "in their own language no words for sin, for piety, for prayer, for repentance"; and of another of the aboriginal tribes of India Mr. Campbell remarks that they "are . . . said to be without moral sense." Lord Avebury in this connection even quotes a statement to the effect that the expressions which the Tonga Islanders have for ideas like vice and injustice "are equally applicable to other things." The South American Indians of the Gran Chaco are said by the missionaries to "make no distinction between right and wrong, and have therefore neither fear nor hope of any present or future punishment or reward, nor any mysterious terror of some supernatural power." Finally, Lord Avebury observes that religion, except in the more advanced races, has no moral aspect or influence, that the deities are almost invariably regarded as evil, and that the belief in a future state is not at first associated with reward or punishment.[45]

[Footnote 45: Avebury, _op. cit._ p. 417 _sqq._]

Many of the facts referred to by Lord Avebury do not at all presuppose the absence of moral feelings. It is difficult to see why the malevolence of gods should prevent men from having notions of right and wrong, and we know from the Old Testament itself that there may be a moral law without Paradise {127} and Hell. The statement concerning the Comanches only implies that, among them, individual freedom is great; whilst the social disorder which prevails among various peoples at times of political disorganisation indicates that the cohesiveness of the political aggregate is weak, as well as a certain discrepancy between moral ideas and moral practice. In Morocco, also, the death of a Sultan is immediately followed by almost perfect anarchy, and yet the people recognise both the moral tenets of the Koran and the still more stringent tenets of their ancient customs. As to the Basutos, Casalis expressly states that they have the idea of moral evil, and represent it in their language by words which mean ugliness, or damage, or debt, or incapacity;[46] and M. Arbousset once heard a Basuto say, on an unjust judgment being pronounced, "The judge is powerful, therefore we must be silent; if he were weak, we should all cry out about his injustice."[47] Moreover, a people may be unconscious of what is just "in the abstract," and of moral "notions," in the strict sense of the term, and at the same time, in concrete cases, distinguish between right and wrong, just and unjust. Of the Western Australians, Mr. Chauncy expressly says that they have a keen sense of justice, and mentions an instance of it;[48] whilst our latest authorities on the Central Australians observe that, though their moral code differs radically from ours, "it cannot be denied that their conduct is governed by it, and that any known breaches are dealt with both surely and severely."[49] As regards the Tonga Islanders, Mariner states that "their ideas of honour and justice do not very much differ from ours except in degree, they considering some things more honourable than we should, and others much less so"; and in another place he says that "the notions of the Tonga people, in respect to honour and

justice . . . are tolerably well defined, steady and universal," though not always acted upon.[50] The statement that the American Indians have "no moral sense whatever," sounds very strange when compared with what is known about their social and moral life; Buchanan, for instance, asserts that they "have a strong innate sense of justice."[51] Of course, there may be diversity of opinion as to what constitutes the "moral sense"; if the conception of sin or other theological notions are regarded as essential to it, it is probably {128} wanting in a large portion of mankind, and not only in the least civilised. When missionaries or travellers deny to certain savages moral feelings and ideas, they seem chiefly to mean feelings or ideas similar to their own.

[Footnote 46: Casalis, _Basutos_, p. 304.]

[Footnote 51: Buchanan, _Sketches of the History, &c., of the North American Indians_, p. 158.]

Of many savage and barbarous peoples it is directly affirmed that they have a sense of justice. Mr. Man says concerning the Andaman Islanders, "Certain traits which have been noticeable in their dealings with us would give colour to the belief that they are not altogether lacking in the sense of honour, and have some faint idea of the meaning of justice."[52] Colonel Dalton states that, among the Korwás on the highlands of Sirgúja, when several persons are implicated in one offence, he has found them "most anxious that to each should be ascribed his fair share of it, and no more, the oldest of the party invariably taking on himself the chief responsibility as leader or instigator, and doing his utmost to exculpate as unaccountable agents the young members of the gang."[53] The Aleuts, according to Veniaminof, are "naturally inclined to be just," and feel deeply undeserved injuries.[54] Kolben, who is nowadays recognised as a good authority,[55] wrote of the Hottentots, "The strictness and celerity of the Hottentot justice are things in which they outshine all Christendom."[56] Missionaries have wondered that, among the Zulus, "in the absence for ages of all revealed truth and all proper religious instruction, there should still remain so much of mental integrity, so much ability to discern truth and justice, and withal so much regard for these principles in their daily intercourse with one another."[57] Zöller ascribes to the Negro a well-developed feeling of justice. "No European," he says, "at least no European child, could discriminate so keenly between just and unjust punishment."[58] Mr. Hinde observes:--"One of the most marked characteristics of black people is their keen perception of justice. They do not resent merited punishment where it is coupled with justice upon other matters. The Masai have their sense of justice particularly strongly developed."[59] Dieffenbach writes of the Maoris, "There is a high natural sense of justice amongst them; {129} and it is from us that they have learnt that many forbidden things can be done with impunity, if they can only be kept secret."[60] Justice is a virtue which always commands respect among the Bedouins, and "injustice on the part of those in power is almost impossible. Public opinion at once asserts itself; and the Sheykh, who should attempt to override the law, would speedily find himself deserted."[61]

Much less conspicuous than the emotion of public resentment is the emotion of public approval. These public emotions are largely of a sympathetic character, and, whilst a tendency to sympathetic resentment is always involved in the sentiment of social affection, a tendency to sympathetic retributive kindly emotion is not. Among the lower animals this latter emotion seems hardly to occur at all, and in men it is often deplorably defective. Resentment towards an enemy is itself, as a rule, a much stronger emotion than retributive kindly emotion towards a friend. And, as for the sympathetic forms of these emotions, it is not surprising that the altruistic sentiment is more readily moved by the sight of pain than by the sight of pleasure,[62] considering that its fundamental object is to be a means of protection for the species. Moreover, sympathetic retributive kindliness has powerful rivals in the feelings of jealousy and envy, which tend to make the individual hostile both towards him who is the object of a benefit and towards him who bestows it. As an ancient writer observes, "many suffer with their friends when the friends are in distress, but are envious of them when they prosper."[63] But though these circumstances are a hindrance to the rise of retributive kindly emotions of a sympathetic kind, they do not prevent public approval in a case when the whole society profits by a benefit, nor have they any bearing on those disinterested instinctive likings of which I have spoken above. I think, then, we may {130} safely conclude that public praise and moral approval occurred, to some degree, even in the infancy of human society. It will appear from numerous facts recorded in following chapters, that the moral consciousness of modern savages contains not only condemnation, but praise.

CHAPTER VI

ANALYSIS OF THE PRINCIPAL MORAL CONCEPTS

WE have assumed that the moral concepts are essentially generalisations of tendencies in certain phenomena to call forth moral emotions. We have further assumed that there are two kinds of moral emotions: indignation and approval. If these assumptions hold good, either indignation or approval must be at the bottom of every moral concept. That such is really the case will, I think, become evident from the present chapter, in which the principal of those concepts will be analysed.

Our analysis will be concerned with moral concepts formed by the civilised mind. Whilst the most representative of English terms for moral estimates have equivalents in the other European languages, I do not take upon myself to decide to what extent they have equivalents in non-European tongues. That all existing peoples, even the very lowest, have moral emotions is as certain as that they have customs, and there can be no doubt that they give expression to those emotions in their speech. But it is another question how far their emotions have led to such generalisations as are implied in moral concepts. Concerning the Fuegians M. Hyades observes, "Les idées abstraites sont chez eux à peu près nulles. Il est difficile de définir exactement ce qu'ils appellent un homme bon et un homme méchant; mais à coup sûr ils n'ont pas la notion de ce qui est bon ou mauvais, abstraction faite de l'individu ou de l'objet auquel ils appliqueraient l'un ou l'autre {132} de ces attributs."[1] The language of the Californian Karok, though rich in its vocabulary, is said to possess no equivalent for "virtue."[2] In the aboriginal tongues of the highlanders of Central India "there seem to be no expressions for abstract ideas, the few such which they possess being derived from the Hindí. . . . . The nomenclature of religious ceremony, of moral qualities, and of nearly all the arts of life they possess, are all Hindí."[3] On a strict examination of the language of the Tonga Islanders, Mariner could discover "no words essentially expressive of some of the higher qualities of human merit, as virtue, justice, humanity; nor of the contrary, as vice, injustice, cruelty, &c. They have indeed expressions for these ideas," he adds, but these expressions "are equally applicable to other things. To express a virtuous or good man, they would say, _tangata lillé_, a good man, or _tangata loto lillé_, a man with a good mind; but the word lillé, good (unlike our word virtuous), is equally applicable to an axe, canoe, or anything else."[4] Of the Australian natives about Botany Bay and Port Jackson Collins wrote, "That they have ideas of a distinction between good and bad is evident from their having terms in their language significant of these qualities." A fish of which they never ate, was _wee-re_, or bad, whereas the kangaroo was _bood-yer-re_, or good; and these expressions were used not only for qualities which they perceived by their senses, but for all kinds of badness and goodness, and were the only terms they had for wrong and right. "Their enemies were wee-re; their friends bood-yer-re. On our speaking of cannibalism, they expressed great horror at the mention, and said it was wee-re. On seeing any of our people punished or reproved for ill-treating them, they expressed their approbation, and said it was bood-yer-re, it was right."[5]

[Footnote 1: Hyades and Deniker, _Mission scientifique du Cap Horn_, vii. 251.]

[Footnote 2: Powers, _Tribes of California_, p. 22.]

[Footnote 3: Forsyth, _Highlands of Central India_, p. 139.]

[Footnote 4: Mariner, _Natives of the Tonga Islands_, ii. 147 _sq._]

[Footnote 5: Collins, _English Colony in New South Wales_, i. 548 _sq._]

{133} Considering, moreover, that even the European languages make use of such general terms as "good" and "bad" for the purpose of expressing moral qualities, it seems likely that, originally, moral concepts were not clearly differentiated from other more comprehensive generalisations, and that they assumed a more definite shape only by slow degrees. At the same time we must not expect to find the beginning of this process reflected in the vocabularies of languages. There is every reason to believe that a savage practically distinguishes between the "badness" of a man and the "badness" of a piece of food, although he may form no clear idea of the distinction. As Professor Wundt observes, "the phenomena of language do not admit of direct translation back again into ethical processes: the ideas themselves are different from their vehicles of expression, and here as everywhere the external mark is later than the internal act for which it stands."[6] Language is a rough generaliser; even superficial resemblance between different phenomena often suffices to establish linguistic identity between them. Compare the rightness of a line with the rightness of conduct, the wrongness of an opinion with the wrongness of an act. And notice the different significations given to the verb "ought" in the following sentences:--"They ought to be in town by this time, as the train left Paris last night"; "If you wish to be healthy you ought to rise early"; "You ought always to speak the truth." Though it may be shown that in these statements the predicate "ought" signifies something which they all have in common--the reference to a rule,[7]--we must by no means assume that this constitutes the essence of the moral "ought," or gives us the clue to its origin.

[Footnote 6: Wundt, _Ethik_, p. 36 (English translation, p. 44).]

[Footnote 7: _Cf._ Stephen, _Liberty, Equality, Fraternity_, p. 343 _sq._]

Discarding all questions of etymology as irrelevant to our subject,[8] we shall, in our analysis of moral concepts, {134} endeavour to fix the true import of each concept by examining how, and under what circumstances, the term expressing it is generally applied. We shall restrict ourselves to the principal, typical terms which are used as predicates in moral judgments. If we succeed in proving that they are all fundamentally derived from either moral indignation or moral approval, there can be no reasonable doubt as to the origin of the rest.

[Footnote 8: The attempt to apply the philological method to an examination of moral concepts has, in my opinion, proved a failure--which may be seen from Mr. Baynes' book on _The Idea of God and the Moral Sense in the Light of Language_.]

The tendency in a phenomenon to arouse moral indignation is directly expressed by the term _bad_, and a disposition of mind which is characterised by some special kind of badness is called _vice_. Closely allied to the term "bad" is the term _wrong_. But there is a difference in the use of these words. Whilst "bad" may be applied both to a person's character and to his conduct, only his conduct may be said to be "wrong." The reason for this is that the concept of moral wrongness is modelled on the idea of a moral law, the breach of which is regarded as "wrong." And, by laying down a moral law, we only enjoin a certain mode of conduct; we do not command a person to have a certain character.

The moral law is expressed by the term _ought_, a term which, in modern ethics, generally occupies a central position among moral predicates. The notion which it embodies is frequently looked upon as ultimate and incapable of analysis--"too elementary" (to quote Professor Sidgwick) "to admit of any formal definition."[9] This view, I think, instead of simplifying the matter, has been one of the chief causes of the prevailing confusion in ethical thought.

[Footnote 9: Sidgwick, _Methods of Ethics_, p. 33.]

Far from being a simple notion, "ought" appears to me clearly decomposable, even though it have a special flavour of its own. First of all, it expresses a conation. When I feel that I ought to do a thing, I experience an impulse to do it, even though some opposite impulse may finally determine my action. And when I say to another man, "You ought to do this, or that," there is certainly implied {135} a purpose to influence his action in a certain direction. In the notion of _duty_, the ethical import of which is identical with that of "ought," this conative element is not so obvious.

Closely connected with the conative nature of "ought" is the imperative character it is apt to assume. But, though frequently used imperatively, "ought" is not necessarily and essentially imperative. Even if the "ought" which I address to myself, in a figurative sense, may be styled a command, it is hardly appropriate to speak of a present command with reference to past actions. The

common phrase, "You ought to have done this, or that," cannot be called a command.

The conation expressed in "ought" is determined by the idea that the mode of conduct which ought to be performed is not, or will possibly not be, performed. It is also this idea of its not being performed that determines the emotion which gives to "ought" the character of a moral predicate. The doing of what ought not to be done, or the omission of what ought not to be omitted, is apt to call forth moral indignation--this is the most essential fact involved in the notion of "ought." Every "ought"-judgment contains implicitly a negation. Nobody would ever have dreamt of laying down a moral rule if the idea of its transgression had not presented itself to his mind. We may reverse the words of the Apostle,[10] and say that where no transgression is, there is no law. When Solon was asked why he had specified no punishment for one who had murdered a father, he replied that he supposed it could not occur to any man to commit such a crime.[11] Similarly, the modern Shintoist concludes that the primæval Japanese were pure and holy from the fact that they are represented as a people who had no moral commandments.[12] It is this prohibitive character of "ought" that has imparted to duty that idea of antagonism to inclination which has found its most famous expression {136} in the Kantian ethics, and which made Bentham look upon the word itself as having in it "something disagreeable and repulsive."[13] It is the intrinsic connection between "ought" and "wrong" that has given to duty the most prominent place in ethical speculation whenever moral pessimism has been predominant. Whilst the ancient Greeks, with whom happiness was the state of nature, never spoke of duty, but held virtue to be the Supreme Good, Christianity, on the other hand, which looked upon man as a being born and bred in sin, regarded morals pre-eminently as the science of duty. Then, again, in modern times, Kant's categorical imperative came as a reaction against that moral optimism which once more had given the preference to virtue, considering everything in the world or in humanity as beautiful and good from the very beginning.[14] It is also worth noting that the feeling of self-complacency connected with the consciousness of having acted in accordance with the law of duty, has no distinctively expressive name in ordinary language, while the opposite feeling is known by so familiar and distinctive a term as "remorse." This is not, as has been said,[15] "a significant indication of the moral condition of mankind," but a significant indication of the true import of the notion of duty itself.

[Footnote 10: _Romans_, iv. 15.]

[Footnote 11: Diogenes Laërtius, _Solon_, 10. Cicero, _Pro S. Roscio Amerino_, 25.]

[Footnote 12: Griffis, _Religions of Japan_, p. 72.]

[Footnote 13: Bentham, _Deontoiogy_, i. 10.]

[Footnote 14: Ziegler, _Social Ethics_, pp. 22, 75 _sq._]

[Footnote 15: Murray, _Introduction to Ethics_, p. 108.]

It is not, then, in the emotion of approval that we must seek for the origin of this concept. We may undoubtedly applaud him who is faithful to his duty, but the idea of duty involves no applause. There is no contradiction in the omission of an act being disapproved of and the performance of it being praised. "Ought" and "duty" express only the tendency of an omission to call forth disapproval, and say nothing about the consequences of the act's performance. The conscientious man refuses the homage paid to him, by saying, "I have only done my duty." Duty is a "stern {137} lawgiver," who threatens with punishment, but promises no reward.[16]

[Footnote 16: The intrinsic connection between duty and disapproval has previously been noticed by Stuart Mill (in a note to James Mill's _Analysis of the Human Mind_, ii. 325), according to whom "no case can be pointed out in which we consider anything as a duty, and any act or omission as immoral or wrong, without regarding the person who commits the wrong and violates the duty as a fit object of punishment." _Cf._ also Bain, _Emotions and the Will_, ch. 15, and Gizycki, _Introduction to the Study of Ethics_, English adaptation by Stanton Coit, p. 102 _sq._]

The ideas of "ought" and "duty" thus spring from the same source as the ideas of "bad" and "wrong." To say that a man ought to do a thing is, so far as the morality of his action is concerned, the very same thing as to say that it is bad, or wrong, of him not to do it--in other words, that the not-doing of it has a tendency to call forth moral disapproval.

"Wrong" is popularly regarded as the opposite of _right_, and they are really contradictories, but only within the sphere of positive moral valuation. We do not call the actions of irresponsible beings, like animals or infants, "right," although they are not wrong; nor do we pronounce morally indifferent actions of responsible beings to be "right," unless we wish thereby especially to mark their moral value as not being wrong. An act which is permissible is of course not wrong, and so far it may be said to be right; but it

would be more accurate to say that people have _a_ right to do it. The adjective "right," in its strict sense, refers to cases from which the indifferent is excluded. A right action is, on a given occasion, _the_ right action, and other alternatives are wrong. "Right" is thus closely related to "ought," but at the same time "right" and "obligatory" are not identical. I cannot quite subscribe to the view of Professor Sidgwick, that "in the recognition of conduct as 'right' is involved an authoritative prescription to do it."[17] What is right is in accordance with the moral law; the adjective "right" means that duty is fulfilled. It is true that the super-obligatory also is right. But "right" takes no notice of the super-obligatory as distinct from the obligatory, and what goes {138} beyond duty always involves the fulfilment of some duty. It may be admitted to be "not only right," but not to be more right. Right has no comparative. A duty is either fulfilled or not, and unless it be perfectly fulfilled the conduct is wrong. There are degrees of wrongness and of goodness, as the moral indignation and the moral approval may be stronger or weaker, but there are no degrees of rightness.

[Footnote 17: Sidgwick, _op. cit._ p. 106.]

The fact that the right action is a duty fulfilled accounts for the erroneous opinion so generally held by ethical writers that "right" is intrinsically connected with moral approval.[18] The choice of the right alternative may give us satisfaction and call forth in us an emotion of approval. This emotion may be the motive for our pointing out the rightness of the act, and the judgment in which we do so may even intrinsically contain applause. The manner in which the judgment "That is right," is pronounced, often shows that it is meant to be an expression of praise. But this does not imply that the concept "right" by itself has reference to moral approval and involves praise. It only means that in one word is expressed a certain concept--the concept that a duty is fulfilled--_plus_ an emotion of approval. That "right" _per se_ involves no praise is obvious from the fact that we regard it as perfectly right to pay a debt and to keep a promise, or to abstain from killing, robbing, or lying, although such acts or omissions generally have no tendency whatever to evoke in us an emotion of moral approval.

[Footnote 18: Hutcheson, _Essay on the Nature and Conduct of the Passions and Affections, with Illustrations on the Moral Sense_, p. 279. Clifford, _Lectures and Essays_, pp. 294, 304 _sq._ Fowler and Wilson, _Principles of Morals_, ii. 199. Alexander, _Moral Order and Progress_, p. 399.]

The concept of "right," then, as implying that the opposite mode of conduct would have been wrong, ultimately derives its moral significance from moral disapproval. This may seem strange considering that "right" is commonly looked upon as positive and "wrong" as its negation. But we must remember that language and popular conceptions in these matters start {139} from the notion of a moral rule or command. It is a matter of paramount importance that such modes of conduct as are apt to arouse moral indignation should be avoided. People try to prevent them by prohibitions and injunctions, often emphasised by threats of penalties for the transgressors. The whole moral and social discipline is based upon commands; customs are rules of conduct, and so are laws. It is natural, then, that the notion of a command should figure uppermost in popular conceptions of morality. Obedience to the command is right, a breach of it is wrong. But the fact which gives birth to the command itself is the indignation called forth by the act which the command forbids, or by the omission of that which it enjoins.

I have spoken here of "right" as an adjective. Used as a substantive, to denote _a right_, it also, in whatever sense it be used, expresses a concept which is rooted in the emotion of moral disapproval. To have a right to do a thing is to be allowed to do it, either by positive law, in the case of a legal right, or by the moral law, in the case of a moral right; in other words, to have a moral right to do a thing means that it is not wrong to do it. But generally the concept of "a right" means something more than this. From the fact that an act is allowable, that it is not wrong, it follows, as a rule, that it ought not to be prevented, that no hindrance ought to be put in the way of its performance; and this character of inviolability is largely included in the very concepts of rights. That a man has a right to live does not merely mean that he commits no wrong by supporting his life, but it chiefly means that it would be wrong of other people to prevent him from living, that it is their duty not to kill him, or even, as the case may be, that it is their duty to help him to live. And in order to constitute a right in him, the duty in question must be a duty _to him_. That a right belonging to A is not merely a duty incumbent on B, but a duty _to_ A incumbent on B, will become evident from an example. To kill another {140} person's slave may be condemned as an injury done to the slave himself, in which case it is a duty to the slave not to kill him; or to kill another person's slave may be condemned on account of the loss it causes to the master, in which case it is deemed a duty to the master not to kill the slave. In the latter case we can hardly say that the duty of not killing the slave constitutes a right to live in the slave--it only constitutes a right in the master to retain his slave alive, not to be deprived of him by an act causing his death.

So commonly does the conception of a right belonging to a person contain the idea of a duty which other persons owe him, that it seems necessary to point out the existence of rights in which no such idea is involved. A man's right to defend his country, for instance, does not intrinsically imply that it is wrong of the enemy to disable him from doing so. But, on the other hand, there are

rights which are nothing else than duties towards those who have the rights. A right is not always a person's right to a certain activity, or to abstaining from a certain activity; it may have exclusive reference to other people's acts or omissions. That a man has the right to be rewarded by his country only means that his country is under an obligation to reward him. That a father has a right to be obeyed by his children only means that it is a duty incumbent on his children to obey him. That a person has the right of bodily integrity only means that it is wrong to inflict on him a bodily injury. These rights may, no doubt, if violated, give rise to certain rights of activity: a man may have a right to claim the reward which is due to him, a father to exact from his children the obedience which they owe him, a person who is wronged to defend himself. But the rights of claiming a reward, of exacting obedience, of resisting wrong, are certainly not identical with the rights of being rewarded, of being obeyed, of not being wronged.

It is commonly said that rights have their corresponding duties. But if this expression is to be used, it must be {141} remembered that the duty which "corresponds" to a right, as a matter of fact, is either included in that right or simply identical with it. The identity between the right and the duty, then, consists in this, that the notion of a right belonging to a person is identical with the notion of a duty towards him. Rights and duties are not identical in the sense that it is always a duty to insist on a right, though this has been urged.[19] If anybody prevents me from making use of my right it may no doubt be deemed a duty on my part not to tolerate the wrong committed against me, but nothing of the kind is involved in the concept of a right. And the same may be said with reference to the assertion that a right to do a thing is always, at the same time, a duty to do it--an assertion which is a consequence of the doctrine that there is nothing morally indifferent and nothing that goes beyond duty; in other words, that all conduct of responsible beings is either wrong or obligatory. Even if this doctrine were psychologically correct--which it is not--even if there were a constant coincidence between the acts which a person has a right to perform and acts which it is his duty to perform, that would not constitute identity between the concepts of rights and duties. According to the meaning of a right, A's right may be B's duty towards A, but A's right cannot be A's duty towards B or anybody else.

[Footnote 19: Alexander, _op. cit._ p. 146 _sq._]

Closely connected with the notions of wrongness and rightness are the notions of _injustice_ and _justice_. Injustice, indeed, is a kind of wrongness. To be unjust is always to be unjust to somebody, and this implies a doing of wrong to somebody, a violation of somebody's right. "Justice," again, is a kind of rightness. It involves the notion that a duty to somebody, a duty corresponding to a right, is fulfilled;[20] we say that justice "demands" that it should be fulfilled. As an act is "right" if its omission {142} is wrong, so an act is "just," in the strict sense of the word, if its omission is unjust. But, like the adjective "right," the adjective "just" is also sometimes used in a wider sense, to denote that something is "not unjust." As non-obligatory acts that are "not wrong" can hardly be denied to be "right," so non-obligatory acts that are "not unjust" can hardly be denied to be "just," although they are not demanded by justice.

[Footnote 20: According to the _Institutiones_ of Justinian (i. 1. 1) "justice is the constant and perpetual will to render to each one his right,"--"justitia est constans et perpetua voluntas jus suum cuique tribuens."]

At the same time, "injustice" and "justice" are not simply other names for violating or respecting rights. Whenever we style an act "unjust," we emphasise that it involves partiality. We do not denominate murder and robbery unjust, but wrong or criminal, because the partiality involved in their commission is quite obscured by their general wrongness or criminality; but we at once admit their gross injustice when we consider that the murderer and robber indulged their own inclinations with utter disregard of their neighbours' rights. And we look upon "unjust" as an exceedingly appropriate term for a judge who condemns an innocent man with the intention to save the culprit, and for an employer who keeps for himself a profit which he ought to share with his employees. Again, when we style an act "just," in the strict sense of the term, we point out that an undue preference would have been shown to somebody by its omission. It is true that, as Adam Smith observes, "we may often fulfil all the rules of justice by sitting still and doing nothing,"[21] and that the man who barely abstains from violating either the person or the estate or the reputation of his neighbours so far does justice to them; but in such a case we hardly apply the epithet "just," simply because there is no reason for emphasising the partiality involved in the opposite mode of conduct. On the other hand, we say it is just, or, more emphatically, that justice demands, that the innocent should not suffer in the place of the guilty, or that the employer should give his employees all their dues.

[Footnote 21: Adam Smith, _Theory of Moral Sentiments_, p. 117.]

It is necessary to note that the impartiality which justice {143} demands is impartiality within the recognised order of rights, whether these rights themselves have a partial origin or not. A father is unjust if he gives away property to one of his children in preference

to others, in case all of them are recognised to have a right to an equal share in his property, even though it be only a conditional right; and a man is unjust if he keeps for himself a profit to which another man has an equal right. But in a society which regards slavery as a morally permissible institution, a man is not necessarily deemed unjust if he beats a slave in a case where it would have been wrong to beat a freeman. However, in the case of unequal rights, justice admits of no greater difference of treatment than what the difference in rights implies. It may be just to punish a man who by a crime has forfeited that right to be protected from wilfully inflicted pain which every law-abiding citizen possesses, but it is unjust to extend the inequality between his condition and the condition of others beyond the inequality of their rights by inflicting upon him a punishment which is unduly severe.

It is the emphasis laid on the duty of impartiality that gives justice a special prominence in connection with punishments and rewards. A man's rights depend to a great extent upon his actions. Other things being equal, the criminal has not the same rights to inviolability as regards reputation, or freedom, or property, or life, as the innocent man; the miser and egoist have not the same rights as the benefactor and the philanthropist. On these differences in rights due to differences in conduct, the terms "just" and "unjust" lay stress; for in such cases an injustice would have been committed if the rights had been equal. When we say of a criminal that he has been "justly" imprisoned we point out that he was no victim of undue partiality, as he had forfeited the general right to freedom on account of his crime. When we say of a benefactor that he has been "justly" rewarded, we point out that no favour was partially bestowed upon him in preference to others, as he had acquired the special right of being rewarded. But the {144} "justice" of a punishment or a reward, strictly speaking, involves something more than this; as we have seen, what is strictly "just" is always the discharge of a duty corresponding to a right which would have been in a partial manner disregarded by a transgression of the duty. If it is just that a person should be rewarded, he ought to be rewarded, and to fulfil this duty is to do him justice. Again, if it is just that a person should be punished, he ought to be punished, and his not being punished is an injustice to other persons. It is an injustice towards all those whose condemnation of the wrong act finds its recognised expression in the punishment, inasmuch as their rightful claim that the criminal should be punished, their right of resisting wrong, is thereby violated in favour of the wrong-doer. Moreover, his not being punished is an injustice towards other criminals, who have been punished for similar acts, in so far as they have a right to demand that no undue preference should be shown to anybody whose guilt is equal to theirs. Retributive justice may admit of a certain latitude as to the retribution. It may be a matter of small concern from the community's point of view whether men are fined or imprisoned for the commission of a certain crime. But it may be a demand of justice that, under equal circumstances, all of them should be punished with the same severity, since the crime has equally affected their rights.

The emphasis which "injustice" lays on the partiality of a certain mode of conduct always involves a condemnation of that partiality. Like every other kind of wrongness, "injustice" is thus a concept which is obviously based on the emotion of moral disapproval. And so is the concept of "justice," whether it involves the notion that an injustice would be committed if a certain duty were not fulfilled, or it is simply used to denote that a certain mode of conduct is "not unjust." But there is yet another sense in which the word "just" is applied. It may emphasise the impartiality of an act in a tone of praise. Considering how difficult it is to be perfectly impartial and to give every man his due, especially when one's own interests are {145} concerned, it is only natural that men should be applauded for being just, and consequently that to call a person just should often be to praise him. So, also, "justice" is used as the name for a virtue, "the mistress and queen of all virtues."[22] But all this does not imply that an emotion of moral approval enters into the concept of justice. It only means that one word is used to express a certain concept--a concept which, as we have seen, ultimately derives its import from moral disapproval--_plus_ an emotion of approval. That the concept of justice by itself involves no reference to the emotion of moral approval appears from the fact that it is no praise to say of an act that it is "only just."

[Footnote 22: Cicero, _De officiis_, iii. 6.]

* * * * *

From the concepts springing from moral disapproval we pass to those springing from moral approval. Foremost among these ranks the concept _good_.[23]

[Footnote 23: Professor Bain, who takes a very legal view of the moral consciousness, maintains (_Emotions and the Will_, p. 292) that "positive good deeds and self-sacrifice . . . transcend the region of morality proper, and occupy a sphere of their own." A similar opinion has been expressed by Prof. Durkheim (_Division du travail social_), and, more recently, by Dr. Lagerborg, in his interesting essay, 'La nature de la morale' (_Revue internationale de Sociologie_, xi. 466). Prof. Durkheim argues (p. 30) that it would be "contraire à toute méthode" to include under the same heading acts which are obligatory and acts which are objects of admiration, and at the same time exempt from all regulation. "Si donc, pour rester fidèle à l'usage, on réserve aux premiers la

qualification de moraux, on ne saurait la donner également aux seconds." But I fail to see that ordinary usage recognises regulation as the test of morality. On the contrary, terms like "goodness" and "virtue," though having no reference whatever to any moral rule, have always hitherto been applied to qualities avowedly moral.]

Though "good," being affixed to a great variety of objects, takes different shades of meaning in different cases, there is one characteristic common to everything called "good." This is hardly, as Mr. Spencer maintains,[24] its quality of being well adapted to a given end. It is true that the good knife is one which will cut, the good gun one which carries far and true. But I fail to see that "good" in a moral sense involves any idea of an adaptation to a given purpose, and, by calling conduct {146} "good," we certainly do not mean that it "conduces to life in each and all." "Good" simply expresses approval or praise of something on account of some quality which it possesses. A house is praised as "good" because it fulfils the end desired, a wine because it has an agreeable taste, a man on account of his moral worth. "Good," as a moral epithet, involves a praise which is the outward expression of the emotion of moral approval, and is affixed to a subject of moral valuation on account of its tendency to call forth such an emotion.

[Footnote 24: Spencer, _Principles of Ethics_, i. 21 _sqq._]

"Good" has commonly been identified with "right," but such an identification is incorrect. A father does right in supporting his young children, inasmuch as he, by supporting them, discharges a duty incumbent upon him, but we do not say that he does a good deed by supporting them, or that it is good of him to do so. Nor do we call it good of a man not to kill or rob his neighbours, although his conduct is so far right. The antithesis between right and wrong is, in a certain sense at least, contradictory, the antithesis between good and bad is only contrary. Every act--provided that it falls within the sphere of positive moral valuation--that is not wrong is right, but every act that is not bad is not necessarily good. Just as we may say of a thing that it is "not bad," and yet refuse to call it "good," so we may object to calling the simple discharge of a duty "good," although the opposite mode of conduct would be bad. On the other hand, no confusion of ethical concepts is involved in attributing goodness to the performance of a duty, or, in other words, praising a man for an act the omission of which would have incurred blame. To say of one and the same act that it is right and that it is good, really means that we look upon it from different points of view. Since moral praise expresses a benevolent attitude of mind, it is commendable for a man not to be niggard in his acknowledgment of other people's right conduct; whereas, self-praise being objectionable, only the other point of view is deemed proper when he passes a {147} judgment upon himself. He may say, without incurring censure, "I have done my duty, I have done what is right," but hardly, "I have done a good deed"; and it would be particularly obnoxious to say, "I am a good man." The best man even refuses to be called good by others:--"Why callest thou me good? there is none good but one, that is, God."[25]

[Footnote 25: _St. Matthew_, xix. 17.]

Whilst "goodness" is the general expression for moral praise, _virtue_ denotes a disposition of mind which is characterised by some special kind of goodness. He who is habitually temperate possesses the virtue of temperance, he who is habitually just the virtue of justice. And even when a man is simply said to be "virtuous," this epithet is given to him, more or less distinctly, with reference to some branch of goodness which constitutes his virtue. A Supreme Being, to whom is attributed perfect goodness, is not called virtuous, but good.

It was the opinion of Aristotle that virtue is imperfect so long as the agent cannot do the virtuous action without a conflict of impulses. Others maintain, on the contrary, that virtue essentially expresses effort, resistance, and conquest. It has been represented as "mediation through pain";[26] according to Kant, it is "the moral disposition in struggle."[27] But I do not see that virtue presupposes struggle, nor that it is lessened by being exercised with little or no effort. A virtue consists in the disposition to will or not to will acts of a certain kind, and is by no means reduced by the fact that no rival impulses make themselves felt. It is true that by struggle and conquest a man may display more virtue, namely, the virtue of self-restraint in addition to the virtue gained by it. The vigorous and successful contest against temptation constitutes a virtue by itself. For instance, the quality of mind which is exhibited in a habitual and victorious effort to conquer strong sexual passions is a virtue distinguishable from that of chastity. But even this virtue of {148} resisting seductive impulses is not greater, _ceteris paribus_, in proportion as the victory is more difficult. Take two men with equally strong passions and equally exposed to temptations, who earnestly endeavour to lead a chaste life. He who succeeds with less struggle, thanks to his greater power of will, is surely inferior neither in chastity nor in self-restraint. Suppose, again, that the two men were exposed to different degrees of temptation. He who overcomes the greater temptation _displays_ more self-restraint; yet the other man may possess this virtue in an equal degree, and his chastity is certainly not made greater thereby. He may have more merit, but merit is not necessarily proportionate to virtue.

[Footnote 26: Laurie, _Ethica_, p. 253 _sqq._]

[Footnote 27: Kant, _Kritik der praktischen Vernunft_, i. 1. 3 (_Sämmtliche Werke_, v. 89).]

The virtues are broad generalisations of mental dispositions which, on the whole, are regarded as laudable. Owing to their stereotyped character, it easily happens, in individual cases, that the possession of a virtue confers no merit upon the possessor; and, at least from the point of view of the enlightened moral consciousness, a man's virtues are no exact gauge of his moral worth. In order to form a just opinion of the value of a person's character, we must take into account the strength of his instinctive desires and the motives of his conduct. There are virtues that pay no regard to this. A sober man, who has no taste for intoxicants, possesses the virtue of sobriety in no less degree than a man whose sobriety is the result of a difficult conquest over a strong desire. He who is brave with a view to be applauded is not, as regards the virtue of courage, inferior to him who faces dangers merely from a feeling of duty. The only thing that the possession of a virtue presupposes is that it should have been tried and tested. We cannot say that people unacquainted with intoxicants possess the virtue of sobriety, and that a man who never had anything to spend distinguishes himself for frugality. For to attribute a virtue to somebody is always to bestow upon him some degree of praise, and it is no praise, only irony, to say of a man that he "makes a virtue of necessity."

{149} Attempts have been made to reconcile the Aristotelian and the Kantian views of the relation between virtue and effort, by saying that virtue is the harmony won and merit is the winning of it.[28] This presupposes that a man to whom virtue is natural has had his fights. But, surely, it is not always so. Who could affirm that every temperate, or charitable, or just man has acquired the virtue only as a result of inward struggle? There are people to whom some virtues at least are natural from the beginning, and others who acquire them with a minimum of effort.

[Footnote 28: Dewey, _Study of Ethics_, p. 133 _sq._ Simmel, _Einleitung in die Moralwissenschaft_, i. 228. _Cf._ also Shaftesbury 'Inquiry concerning Virtue and Merit,' i. 2. 4, in _Characteristicks_, ii. 36 _sqq._]

There has been much discussion about the relation between virtue and duty. It has been said that "they are co-extensive, the former describing conduct by the quality of the agent's mind, the latter by the nature of the act performed";[29] that they express the same ideal, virtue subjectively, duty objectively;[30] or that virtue, in its proper sense, is "the quality of character that fits for the discharge of duty," and that it "only lives in the performance of duty."[31] At the same time it is admitted that "the distinctive mark of virtue seems to lie in what is beyond duty," and that "though every virtue is a duty, and every duty a virtue, there are certain actions to which it is more natural to apply the term virtuous."[32] Prof. Sidgwick, again, in his elaborate chapter on 'Virtue and Duty,' remarks that he has "thought it best to employ the terms so that virtuous conduct may include the performance of duty as well as whatever good actions may be commonly thought to go beyond duty; though recognising that virtue in its ordinary use is most conspicuously manifested in the latter."[33]

[Footnote 29: Alexander, _op. cit._ p. 244.]

[Footnote 30: Grote, _Treatise on the Moral Ideals_, p. 22. _Cf._ Seth, _Study of Ethical Principles_, p. 239.]

[Footnote 31: Muirhead, _Elements of Ethics_, p. 190 n.*]

[Footnote 32: Alexander, _op. cit._ p. 243 _sq._]

[Footnote 33: Sidgwick, _op. cit._ p. 221.]

It can be no matter of surprise that those who regard the notion of "duty" as incapable of being analysed, or {150} who fail to recognise its true import, are embarrassed by its relation to virtue. We do not call it a virtue if a man habitually abstains from killing or robbing, or pays his debts, or performs a great number of other duties. We do call chastity and temperance and justice virtues, although we regard it as obligatory on a man to be chaste, temperate, just. We also call hospitality, generosity, and charity virtues in cases where they go beyond the strict limits of duty. "The relation of virtue and duty is complicated," says Professor Alexander.[34] "In its common use each term seems to include something excluded from the other," observes Professor Sidgwick.[35] But, indeed, the relation is not complicated, for there is no other intrinsic relation between them than their common antagonism to "wrong." That something is a duty implies that its non-performance tends to evoke moral indignation, that it is a virtue implies that its performance tends to evoke moral approval. That the virtues actually cover a comparatively large field of the province of duty is simply owing to their being dispositions of mind. We may praise the habits of justice and gratitude, even though we find nothing praiseworthy in an isolated just or grateful act.

[Footnote 34: Alexander, _op. cit._ p. 244.]

[Footnote 35: Sidgwick, _op. cit._ p. 219.]

There has been no less confusion with regard to the relation between duty and _merit_. Like the notions of "good" and "virtue," the "meritorious" derives its origin from the emotion of moral approval; but while the former merely express a tendency to give rise to such an emotion, "meritorious" implies that the object to which it refers merits praise, that it has a just claim to praise, or, in other words, that it ought to be recognised as good. This makes the term "meritorious" more emphatic than the term "good," but at the same time it narrows its province in a peculiar way. Just as the expression that something ought to be done implies the idea of its not being done, so the word "meritorious" suggests the idea of goodness which may fail of due recognition. And as it is meaningless to speak of duty in a case where the {151} opposite mode of conduct is entirely out of the question, so it would be an absurdity to attribute merit to somebody for an act the goodness of which is universally admitted. Thus "meritorious" involves a restriction. It would be almost blasphemous to call the acts of a God conceived to be infinitely good meritorious, since it would suggest a limitation of his goodness.

The emphatic claim to praiseworthiness made by the "meritorious" has rendered it objectionable to a great number of moralists. It has been identified with the "super-obligatory"--a conception which is to many an abomination. From what has been said above, however, it is manifest that they are not identical. As the discharge of a duty may be regarded as a good act, so it may also be regarded as an act which ought to be recognised as good. Practically, no doubt, there is a certain antagonism between duty and merit. We praise, and, especially, we regard as deserving praise, only what is above the average,[36] and we censure what is below it. No merit is conferred upon him who performs a duty which is seldom transgressed, or the transgression of which would actually incur punishment or censure. We do not think that a man ought to be praised for what his own interest prompts him to perform; and, since the transgression of a moral command which is usually obeyed is generally censured or punished, there is under ordinary circumstances nothing meritorious in performing a duty. But though thus probably most acts which are deemed meritorious fall outside the limits of duty as roughly drawn by the popular mind, we are on the other hand often disposed to attribute merit to a man on account of an act which, from a strict point of view, is his duty, but a duty which most people, under the same circumstances, would have left undischarged. This shows that the antagonism between duty and merit is not absolute. And in the concept of merit _per se_ no such antagonism is involved.

[Footnote 36: Merit, as Professor Alexander puts it (_op. cit._ p. 196), "expresses the interval which separates the meritorious from the average."]

{152} I confess that I fail to grasp what those writers really mean who identify the "meritorious" with the "super-obligatory," and at the same time deny the existence of any super-obligatory. Do they shut their eyes to the important psychical fact indicated by the term "merit," or do they look upon it as a chimera inconsistent with a sufficiently enlightened moral consciousness? For my own part, I cannot see how the moral consciousness could dispense with the idea that there are actions which merit praise or reward, which ought to be praised or rewarded. The denial of merit can be defended from a purely theological point of view, but then only with regard to man's relation to God. It is obvious that a fallen being who is sinning even when he does his best, could not be recognised as good by God and could have no merit. But it is hardly just, nor is it practically possible, that a man should measure his fellow-man by a superhuman standard of perfection, and try to suppress the natural emotion of moral approval and the claims springing from it, by persuading himself that there is no mortal being who ever does anything which ought to be recognised as good.

Quite distinct from the question of merit, then, is that of the _super-obligatory_. Can a man do more than his duty, or, in other words, is there anything good which is not at the same time a duty? The answer depends on the contents given to the commandments of duty, hence it may vary without affecting the concept of duty itself. If we consider that there is an obligation on every man to promote the general happiness to the very utmost of his ability, we must also maintain that nobody can ever do anything good beyond his duty. The same is the case if we regard "self-realisation," or a "normal" exercise of his natural functions, as a man's fundamental duty. In all these cases "to aim at acting beyond obligation," as Price puts it,[37] is "the same with aiming at acting contrary to obligation, and doing more than is fit to be done, the same with doing wrong." It can hardly be denied, however, {153} that those who hold similar views have actually two standards of duty, one by which they measure man and his doings in the abstract, with reference to a certain ideal of life which they please to identify with duty, and another by which they are guided in their practical moral judgments upon their own and their neighbours' conduct. The conscientious man is apt to judge himself more severely than he judges others, partly because he knows his own case better than theirs,[38] and partly because he is naturally

afraid of being intolerant and unjust. He may indeed be unwilling to admit that he ever can do more than his duty, seeing how difficult it is even to do what he ought to do, and impressed, as he would be, with the feeling of his own shortcomings. Yet I do not see how he could conscientiously deny that he has omitted to do many praiseworthy or heroic deeds without holding himself blamable for such omissions.

[Footnote 37: Price, _Review of the Principal Questions in Morals_, p. 204 _sq._]

[Footnote 38: _Cf._ Sidgwick, _op. cit._ p. 221.]

Professor Sidgwick observes that "we should not deny that it is, in some sense, a man's strict duty to do whatever action he judges most excellent, so far as it is in his power."[39] This, as it seems to me, is not a matter of course, and nothing of the kind is involved in the notion of duty itself. We must not confound the moral law with the moral ideal. Duty is the minimum of morality, the supreme moral ideal of the best man is the maximum of it. Those who sum up the whole of morality in the word "ought" identify the minimum and the maximum, but I fail to see that morality is better for this. Rather it is worse. The recognition of a "super-obligatory" does not lower the moral ideal; on the contrary it raises it, or at any rate makes it more possible to vindicate the moral law and to administer it justly. It is nowadays a recognised principle in legislation that a law loses part of its weight if it cannot be strictly enforced. If the realisation of the highest moral ideal is commanded by a moral law, such a law will always remain a dead letter, and morality will gain nothing. Far above the anxious {154} effort to fulfil the commandments of duty stands the free and lofty aspiration to live up to an ideal, which, unattainable as it may be, threatens neither with blame nor remorse him who fails to reach its summits. Does not experience show that those whose thoughts are constantly occupied with the prescriptions of duty are apt to become hard and intolerant?

[Footnote 39: _Ibid._ p. 219.]

Those who deny the existence of anything morally "praiseworthy" which is not a duty, are also generally liable to deny the existence of anything morally _indifferent_ in the conduct of responsible beings. The "super-obligatory" and the "indifferent" have this in common, that they are "ultra-obligatory," and the denial of the one as well as of the other is an expression of the same tendency to look upon the moral law as the sole fact of the moral consciousness. Even Utilitarianism cannot consistently admit of anything indifferent within the province of moral valuation, since two opposite modes of conduct can hardly produce absolutely the same sum of happiness. Such a repudiation of the "indifferent" being quite contrary to the morality of common sense, which, after all, no ethical theory can afford to neglect, considerable ingenuity has been wasted on vain attempts to show that the "indifferent" is nothing but a rude popular conception unable to keep its ground against a thoroughgoing examination. Professor Ziegler ironically asks:--"Such outward matters as eating and drinking are surely morally indifferent? And yet is eating and drinking too much, is spending too much time in outdoor exercise, is lounging idly about, morally indifferent? or, on the other hand, is it morally allowable or wholesome to reduce oneself and make oneself weak and ill by fasting, or to become a hypochondriac by continually staying indoors?"[40] This argument, however, involves a confusion of different volitions. The fact that eating or drinking generally, or eating or drinking too much or too little, are no matters of indifference, surely does not prevent {155} eating or drinking on some certain occasion from being indifferent. Mr. Bradley again observes:--"It is right and a duty that the sphere of indifferent detail should exist. It is a duty that I should develop my nature by private choice therein. Therefore, _because_ that is a duty, it is a duty _not_ to make a duty of every detail; and thus in every detail I have done my duty."[41] This statement also shows a curious confusion of entirely different facts. It may be very true that it is a duty to recognise certain actions as indifferent. This is one thing by itself. But it is quite another thing to perform those actions. And if it is a duty to recognise certain actions as indifferent how could it possibly at the same time be held a duty to perform them?

[Footnote 40: Ziegler, _op. cit._ p. 85.]

[Footnote 41: Bradley, _Ethical Studies_, p. 195, n. 1.]

It has been maintained that the sphere of the indifferent forms the totality of "ought"; that when the same end may be reached by a variety of means, an action may be indifferent merely in relation to the choice of means, but not so far as regards the attainment of the end, and hence is only apparently indifferent.[42] "If it is my moral duty to go from one town to another," says Mr. Bradley, "and there are two roads which are equally good, it is indifferent to the proposed moral duty _which_ road I take; it is not indifferent _that_ I do take one or the other; and whichever road I do take, I am doing my duty on it, and hence it is far from indifferent: my walking on road A is a matter of duty in reference to the end, though not a matter of duty if you consider it against walking on road B; and so with B--but I can escape the sphere of duty neither on A nor on B." All this is true, but forms no argument against the

"indifferent." The statement, "You ought to go to the town and to take either road A or B," refers to two volitions which are regarded as wrong, namely, the volition not to go to the town at all, and the volition to take any road not A or B; and it {156} refers also to two pairs of volitions in reference to which it indicates that the choice between the volitions constituting each pair is indifferent. You may choose to take road A or not to take it; you may choose to take road B or not to take it. The "indifferent" is always an alternative between contradictories. It can therefore never form part of an "ought"-totality, being itself a totality as complete as possible. This is somewhat disguised by a judgment which makes an obligation of a choice between A and B, but becomes conspicuous if we consider a simple case of indifference. Suppose that it is considered indifferent whether you speak or do not speak on a certain occasion. What is here the "ought" that forms the totality of the indifferent? Would there be any sense in saying that you ought either to speak or not to speak? or is the alternative, speaking--not speaking, only a link in an indefinite chain of alternatives, each of which is by itself indifferent, in a relative sense, but the sum of which forms the "ought"? You may be permitted--it will perhaps be argued--in a given moment to speak or to abstain from speaking, to write or to abstain from writing, to read or to abstain from reading, and so on; but however wide the province of the permissible may be, there must always be a limit inside which you ought to remain. That you do this or that may be a matter of indifference, but only of relative indifference, for it is not indifferent what you do on the whole; hence there is nothing absolutely indifferent. Such an argument, however, involves a misapprehension of the true meaning of the "indifferent." The predicate expressing indifference refers to certain definite volitions and their contradictories, not to the whole of a man's conduct in a certain moment. The whole of a man's conduct is never indifferent. But neither is the whole of a man's conduct ever wrong. In the moment when a murderer kills his victim he is fulfilling an endless number of duties: he abstains from stealing, lying, committing adultery, suicide, and so on. The predicate "wrong" only marks the moral {157} character of a special mode of conduct. Why should not the indifferent be allowed to do the same?

[Footnote 42: Simmel, _op. cit._ i. 35 _sqq._ Alexander, _op. cit._ p. 50 _sqq._ Murray, _op. cit._ p. 26 _sq._ Bradley, _op. cit._ p. 195 _sq._]

It has, finally, been observed that the so-called "indifferent" is something "the morality of which can only be individually determined."[43] This remark calls attention to the fact that no mode of conduct can be regarded as indifferent without a careful consideration of individual circumstances, and that much which is apparently indifferent is not really so. This, however, does not involve an abolition of the indifferent. Such an abolition would be the extreme of moral intolerance. He who tried to put it into practice would be the most insupportable of beings, and to himself life would be unbearable. Fortunately, such a man has never existed. The attempts to make every action, even the most trivial, of responsible beings a matter of moral concern, are only theoretical fancies without practical bearing, a hollow and flattering tribute to the idol of Duty.

[Footnote 43: Martensen, _Christian Ethics_, p. 415.]

CHAPTER VII

CUSTOMS AND LAWS AS EXPRESSIONS OF MORAL IDEAS

MORAL ideas are expressed in moral judgments. We have hitherto examined the predicates of such judgments, the import and origin of the moral concepts. Now a much wider field or research remains for us to traverse. We shall direct our attention to the subjects of moral judgments, to the mass of phenomena which, among different peoples and in different ages, have had a tendency to call forth moral blame and moral praise. We shall discuss the general characteristics which all these phenomena have in common. We shall classify the most important of them, and study the moral ideas held with reference to the phenomena of each class separately. And in both cases we shall not only analyse, but try to find an answer to the question, Why?--the ultimate aim of all scientific research. But before entering upon this vast undertaking, we must define the lines on which it is to be conducted. How can we get an insight into the moral ideas of mankind at large?

In answering this question I need not dwell upon such obvious means of information as direct experience, or records of moral maxims and sentiments found in proverbs, literary and philosophical works, and religious codes. The sources which, from an evolutionary point of view, are of the most comprehensive importance for our study, are tribal and national customs and laws. It is to these sources that the present chapter will be devoted.

{159} We have seen that a custom, in the strict sense of the word, is not merely the habit of a certain circle of men, but at the same time involves a moral rule. There is a close connection between these two characteristics of custom: its habitualness and its obligatoriness. Whatever be the foundation for a certain practice, and however trivial it may be, the unreflecting mind has a

tendency to disapprove of any deviation from it for the simple reason that such a deviation is unusual. As Abraham Tucker observes, "it is a constant argument among the common people, that a thing must be done, and ought to be done, because it always has been done."[1] Children show respect for the customary,[2] and so do savages. "If you ask a Kaffir why he does so and so, he will answer--'How can I tell? It has always been done by our forefathers.'"[3] The only reason which the Eskimo can give for some of their present customs, to which they adhere from fear of ill report among their people, is that "the old Innuits did so, and therefore they must."[4] In the behaviour of the Aleut, who "is bashful if caught doing anything unusual among his people,"[5] and in the average European's dread of appearing singular, we recognise the influence of the same force of habit.

[Footnote 1: Tucker, _Light of Nature_, ii. 593. _Cf._ also Simmel, _Einleitung in die Moralwissenschaft_, i. 65 _sqq._]

[Footnote 2: Sully, _Studies of Childhood_, p. 280 _sq._]

[Footnote 3: Leslie, _Among the Zulus and Amatongas_, p. 146.]

[Footnote 4: Hall, _Arctic Researches_, p. 569.]

[Footnote 5: Dall, _Alaska_, p. 396.]

On the other hand, it should be remembered that not every public habit is a custom, involving an obligation; certain practices, though very general in a society, may even be reprobated by almost every one of its members. The habits of a people must therefore be handled with discretion by the student of moral ideas. Yet when he has no reason to conclude as to some special habit that it is held obligatory, he may, probably always, be sure that it is either allowed, or, in spite of all assurances of its wickedness, that the disapproval of it is not generally very deep or genuine. In a community where lying is a {160} prevailing vice, truthfulness cannot be regarded as a very sacred duty; and where sexual immorality is widely spread, the public condemnation of it always smacks of hypocrisy. Men's standard of morality is not independent of their practice. The conscience of a community follows the same rule as the conscience of an individual. "Commit a sin twice," says the Talmud, "and you will think it perfectly allowable."[6] Hence for the study of the inmost convictions of a nation, its "bad habits" form a valuable complement to its professed opinions.

[Footnote 6: Deutsch, _Literary Remains_, p. 58.]

The dictates of custom being dictates of morality, it is obvious that the study of moral ideas will, to a large extent, be a study of customs. But at the same time it should be borne in mind that custom never covers the whole field of morality, and that the uncovered space grows larger in proportion as the moral consciousness develops. Being a rule of duty, custom may only indirectly be an expression of moral approval, by claiming, in certain cases, that goodness should be rewarded. But even when demanding praise, custom is not always a reliable exponent of merit; it includes politeness, and politeness is a great deceiver. Custom may compel us to praise a man for form's sake, when he deserves no praise, and to thank him when he deserves no thanks. Moreover, custom regulates external conduct only. It tolerates all kinds of volitions and opinions if not openly expressed. It does not condemn the heretical mind, but the heretical act. It demands that under certain circumstances certain actions shall be either performed or omitted, and, provided that this demand is fulfilled, it takes no notice of the motive of the agent or omitter. Again, in case the course of conduct prescribed by custom is not observed, the mental facts connected with the transgression, if regarded at all, are dealt with in a rough and ready manner, according to general rules which hardly admit of individualisation. Yet the incongruity between custom and morality which ensues from these circumstances is on {161} the whole more apparent than real. It is rather an incongruity between different moral standards. The unreflecting moral consciousness, like custom, cares comparatively little for the internal aspect of conduct. It does not ask whether a man goes to church on Sunday from a religious motive or from fear of public opinion; it does not ask whether he stays at home from love of ease or from dissent of belief and avoidance of hypocrisy. It is ready to blame as soon as the dictate of custom is disobeyed. The rule of custom is the rule of duty at early stages of development. Only progress in culture lessens its sway.

Finally, the moral ideas which are expressed in the customs of a certain circle of men are not necessarily shared by every one of its members. This may, in the present connection, be considered a matter of slight importance by him who regards morality as "objectively" realised in the customs of a people, and who denies the individual the right to a private conscience. But from the subjective point of view which I am vindicating, individual conviction has a claim to equal consideration with public opinion, nay frequently, to higher respect, representing as it does in many cases a higher morality, a moral standard more purified by reflection and impartiality. At the lower stages of civilisation, however, where a man is led by his feelings more than by his thoughts, such a differentiation of moral ideas hardly occurs. The opinions of the many are the opinions of all, and the customs of a society are

recognised as rules of duty by all its members.

In primitive society custom stands for law, and even where social organisation has made some progress it may still remain the sole rule for conduct.[7] The authority of {162} a chief does not necessarily involve a power to make laws. Even kings who are described as autocrats may be as much tied by custom as is any of their subjects.

[Footnote 7: Cranz, _History of Greenland_, i. 170. Dall, _op. cit._ p. 381 (Tuski). Dobrizhoffer, _Account of the Abipones_, p. 95. The Rejangs of Sumatra "do not acknowledge a right in the chiefs to constitute what laws they think proper, or to repeal or alter their ancient usages, of which they are extremely tenacious and jealous." There is no word in their language which signifies law, and the chiefs, in pronouncing their decisions are not heard to say, "So the law directs," but, "Such is the custom."[8] According to Ellis, "the veneration of the Malagasy for the customs derived from tradition, or any accounts of their ancestors . . . influences both their public and private habits; and upon no individual is it more imperative than upon their monarch, who, absolute as he is in other respects, wants either the will or the power to break through the long-established regulations of a superstitious people."[9] The king of Ashanti, although represented as a despotic monarch, is nevertheless under an obligation to observe the national customs which have been handed down to the people from remote antiquity, and a practical disregard of this obligation, in the attempt to change some of the old customs, cost one of the kings his throne.[10] "The Africans," says Mr. Winwood Reade, with special reference to Dahomey, "have sometimes their enlightened kings, as the old barbarians had their sages and their priests. But it is seldom in the power of the heads of a people to alter those customs which have been held sacred from time immemorial."[11] The Basutos, among whom "the chiefs have the right of making laws and publishing regulations required by the necessities of the times," regard such laws, or _molaos_, as inferior to the _mekhoas_, "the use and wont," which constitute the real laws of the country.[12] Among the ancient Irish, there was no sovereign authority competent to enact a new law, the function of the king being merely, as chief of the tribal assembly, to see that the proper customs were observed.[13]

HISTORY OF

ANCIENT CIVILIZATION

BY

CHARLES SEIGNOBOS

DOCTOR OF LETTERS OF THE UNIVERSITY OF PARIS

LONDON T. FISHER UNWIN ADELPHI TERRACE MCMVII

(_All rights reserved_)

EDITOR'S NOTE

In preparing this volume, the Editor has used both the three-volume edition and the two-volume edition of the "Histoire de la Civilisation." He has usually preferred the order of topics of the two-volume edition, but has supplemented the material therein with other matter drawn from the three-volume edition.

A few corrections to the text have been given in foot-notes. These notes are always clearly distinguished from the elucidations of the author.

A.H.W.

CONTENTS

CHAPTER I

PREHISTORIC TIMES. Prehistoric archaeology--Prehistoric remains; their antiquity--Prehistoric science--The four ages.

THE ROUGH STONE AGE. Remains found in the gravels--The cave-men.

THE POLISHED STONE AGE. Lake-villages--Megalithic monuments.

THE BRONZE AGE. Bronze--Bronze objects.

THE IRON AGE. Iron--Iron weapons--Epochs of the Iron Age.

Conclusions: How the four ages are to be conceived; uncertainties; solved questions.

CHAPTER II

HISTORY AND THE DOCUMENTS. History--Legends--History in general--Great divisions of history--Ancient history--Modern history--The Middle Ages.

SOURCES FOR THE HISTORY OF ANCIENT CIVILIZATIONS. Books--Monuments--Inscriptions--Languages--Lacunae.

RACES AND PEOPLES. Anthropology--The races--Civilized peoples--Aryans and Semites.

CHAPTER III

THE EGYPTIANS. Egypt--The country--The Nile--Fertility of the soil--The accounts of Herodotus--Champollion--Egyptologists--Discoveries.

THE EGYPTIAN EMPIRE. Antiquity of the Egyptian people--Memphis and the pyramids--Egyptian civilization--Thebes--The Pharaoh--The subjects--Despotism--Isolation of the Egyptians.

RELIGION OF THE EGYPTIANS. The gods--Osiris--Ammon-ra--Gods with animal heads--Sacred animals--The bull Apis--Worship of the dead--Judgment of the soul--Mummies--Book of the Dead--The arts--Industry--Architecture--Tombs--Temples--Sculpture--Painting--Literature-- Destinies of the Egyptian civilization.

CHAPTER IV

THE ASSYRIANS AND BABYLONIANS. Chaldea--The land--The people--The cities.

THE ASSYRIANS--Assyria--Origins--Ancient accounts--Modern discoveries-- Inscriptions on bricks--Cuneiform writing--The Assyrian people--The king--Fall of the Assyrian Empire.

THE BABYLONIANS. The second Chaldean empire--Babylon--The Tower of Babylon.

CUSTOMS AND RELIGION. Customs--Religion--The gods--Astrology-- Sorcery--The sciences.

THE ARTS. Architecture--Palaces--Sculpture.

CHAPTER V

THE ARYANS OF INDIA. The Aryans--Aryan languages--The Aryan people.

PRIMITIVE RELIGION OF THE HINDOOS. The Aryans on the Indus--The Vedas--The gods--Indra--Agni--The cult--Worship of ancestors.

BRAHMANIC SOCIETY. The Hindoos on the Ganges--Castes--The Impure--The Brahmans--The new religion of Brahma--Transmigration of souls-- Character of this religion--The rites--Purity--Penances--The monks.

BUDDHISM. Buddha--Nirvana--Charity--Fraternity--Tolerance--Later history of Buddhism--Changes in Buddhism--Buddha transformed into a god--Mechanical prayer--Amelioration of manners.

CHAPTER VI

THE PERSIANS. The religion of Zoroaster--Iran--The Iranians-- Zoroaster--The Zend-Avesta--Ormuzd and Ahriman--Angels and demons-- Creatures of Ormuzd and Ahriman--The cult--Morality--Funerals-- Destiny of the soul--Character of Mazdeism.

THE PERSIAN EMPIRE. The Medes--The Persians--Cyrus--The inscription of Behistun--The Persian empire--The satrapies--Revenues of the empire--The Great King--Services rendered by the Persians--Susa and Persepolis--Persian architecture.

CHAPTER VII

THE PHOENICIANS. The Phoenician people--The land--The cities--Phoenician ruins--Organization of the Phoenician--Tyre--Carthage--Carthaginian army--The Carthaginians--The Phoenician religion.

PHOENICIAN COMMERCE. Occupations of the Phoenicians--Caravans--Marine commerce--Commodities--Secret kept by the Phoenicians--Colonies-- Influence of the Phoenicians--The alphabet.

CHAPTER VIII

THE HEBREWS. Origin of the Hebrew people--The Bible--The Hebrews--The patriarchs--The Israelites--The call of Moses--Israel in the desert--The Promised Land.

THE RELIGION OF ISRAEL. One God--The people of God--The covenant--The Ten Commandments--The Law--Religion constituted the Jewish people.

THE EMPIRE OF ISRAEL. The Judges--The Hangs--Jerusalem--The tabernacle--The temple.

THE PROPHETS. Disasters of Israel--Sentiments of the Israelites--The prophets--The new teaching--The Messiah.

THE JEWISH PEOPLE. Return to Jerusalem--The Jews--The synagogues-- Destruction of the temple--The Jews after the dispersion.

CHAPTER IX

GREECE AND THE GREEKS. The country--The sea--The climate--Simplicity of Greek life--The people--Origin of the Greeks--Legends--The Trojan War--The Homeric Poems--The Greeks at the time of Homer--The Dorians--The Ionians--The Hellenes--The cities.

THE HELLENES BEYOND THE SEA. Colonization--Character of the colonies-- Traditions touching the colonies--Importance of the Greek colonies.

CHAPTER X

GREEK RELIGION. The gods--Polytheism--Anthropomorphism--Mythology--Local gods--The great gods--Attributes of the gods--Olympus and Zeus--Morality of the Greek mythology.

THE HEROES. Various sorts of heroes--Presence of the heroes-- Intervention of the heroes.

WORSHIP. Principle of the cult of the gods--The great Feasts--the sacred games--Omens--Oracles--Amphictyonies.

CHAPTER XI

SPARTA. The People--Laconia--The Helots--The Perioeci--Condition of the Spartiates.

EDUCATION. The children--The girls--The discipline--Laconism--Music-- The dance--Heroism of the women.

INSTITUTIONS. The kings and the council--The ephors--The army--The hoplites--The phalanx--Gymnastics--Athletes--Role of the Spartiates.

CHAPTER XII

ATHENS. Origins of the Athenian people--Attica--Athens--The revolutions in Athens--Reforms of Cleisthenes.

THE ATHENIAN PEOPLE. The slaves--The foreigners--The citizens.

THE GOVERNMENT. The assembly--The courts--The magistrates--Character of the government--The demagogues.

PRIVATE LIFE. Children--Marriage--Women.

CHAPTER XIII

WARS. The Persian wars--Origin of these wars--Comparison of the two adversaries--First Persian war--Second Persian war--Reasons for the victory of the Greeks--Results of the wars.

WARS OF THE GREEKS AMONG THEMSELVES. The Peloponnesian war--War with Sparta--Savage character of the wars--Effects of these wars.

CHAPTER XIV

THE ARTS IN GREECE. Athens in the time of Pericles--Pericles--Athens and her monuments--Importance of Athens.

LETTERS. Orators--Sages--Sophists--Socrates and the philosophers--The chorus--Tragedy and comedy--Theatre.

ARTS. The Grecian temples--Characteristics of Grecian architecture--Sculpture--Pottery--Painting.

CHAPTER XV

THE GREEKS IN THE ORIENT. Asia before Alexander--Decadence of the Persian empire--Expedition of the Ten Thousand--Agesilaus.

CONQUEST OF ASIA BY ALEXANDER. Macedon--Philip--Demosthenes--The Macedonian supremacy--Alexander--The phalanx--Departure of Alexander--Victories of Granicus, Issus, and Arbela--Death of Alexander--Projects of Alexander.

THE HELLENES IN THE ORIENT. Dismemberment of the empire of Alexander-- The Hellenistic kingdoms--Alexandria--Museum--Pergamum.

CHAPTER XVI

LATER PERIOD OF GREEK HISTORY. Decadence of the cities--Rich and poor--Strife between rich and poor--Democracy and oligarchy--The tyrants--Exhaustion of Greece.

THE ROMAN CONQUEST. The leagues--The allies of the Romans--The last struggles.

THE HELLENES IN THE OCCIDENT. Influence of Greece on Rome-- Architecture--Sculpture--Literature--Epicureans and Stoics.

CHAPTER XVII

ANCIENT PEOPLES OF ITALY. The Etruscans--Etruria--The Etruscan people-- The Etruscan tombs--Industry and commerce--Religion--The augurs-- Influence of the Etruscans.

THE ITALIAN PEOPLE. Umbrians and Oscans--The Sacred Spring--The Samnites--The Greeks of Italy.

LATINS AND ROMANS. The Latins--Rome--Roma Quadrata and the Capitol.

CHAPTER XVIII

RELIGION AND THE FAMILY. Religion--The Roman gods--Form of the gods--Principle of the Roman religion--Worship--Formalism-- Prayer--Omens--The priests.

WORSHIP OF ANCESTORS. The dead--Worship of the dead--Cult of the hearth.

THE FAMILY. Religion of the family--Marriage--Women--Children--Father of the family.

CHAPTER XIX

THE ROMAN CITY. Formation of the Roman people--The kings--The Roman people--The plebeians--Strife between patricians and plebeians-- The tribunes of the plebs--Triumph of the plebs.

THE ROMAN PEOPLE. Right of citizenship--The nobles--The knights--The plebs--Freedmen.

THE GOVERNMENT OF THE REPUBLIC. The comitia--Magistrates--Censors-- Senate--The course of offices.

CHAPTER XX

ROMAN CONQUEST. The Roman army--Military service--The levy--Legions and allies--Military exercises--Camp--Order of battle--Discipline-- Colonies &ad military roads.

CHARACTER OF THE CONQUESTS. War--Conquest of Italy--Punic wars--Hannibal--Conquest of the Orient--Conquest of barbarian lands--The triumph--Booty--Allies of Rome--Motives of conquest.

RESULTS OF THE CONQUESTS. Empire of the Roman people--The public domain--Agrarian laws.

CHAPTER XXI

THE CONQUERED PEOPLES. The provincials--Provinces--The proconsuls-- Tyranny and oppression of the proconsuls--The publicans--Bankers-- Defencelessness of the provincials.

SLAVERY. Sale of slaves--Condition of slaves--Number of slaves--Urban slaves--Rural slaves--Treatment of slaves--Ergastulum and mill-- Character of the slaves--Revolts--Admission to citizenship.

CHAPTER XXII

TRANSFORMATION OF LIFE IN ROME. Influence of Greece and the Orient.

CHANGES IN RELIGION. Greek gods--The Bacchanals--Superstitions of the Orient--Sceptics.

CHANGES IN MANNERS. The old customs--Cato the Elder--The new manners-- Oriental luxury--Greek humanity--Lucullus--The new education--New status of women--Divorce.

CHAPTER XXIII

FALL OF THE REPUBLIC. Causes of the decadence--Destruction of the peasant class--The city plebs--Electoral corruption--Corruption of the Senate--Corruption of the army.

THE REVOLUTION. Necessity of the revolution--Civil wars--The Gracchi-- Marius and Sulla--Pompey and Caesar--End of the Republic--Need of peace--Power of the individual.

CHAPTER XXIV

THE EMPIRE AT ITS HEIGHT. The twelve Caesars--The emperor--Apotheosis-- Senate and people--The praetorians--Freedmen of the emperors-- Despotism and disorder.

THE CENTURY OF THE ANTONINES. Marcus Aurelius--Conquests of the Antonines.

IMPERIAL INSTITUTIONS. Extent of the empire in the second century-- Permanent army--Deputies and agents of the emperor--Municipal life--Imperial regime.

SOCIAL LIFE UNDER THE EMPIRE. The continued decadence at Rome--The shows--Theatre--Circus--Amphitheatre--Gladiators--The Roman peace--Fusion of the peoples--Superstitions.

CHAPTER XXV

ARTS AND SCIENCES IN ROME. Letters--Imitation of the Greeks--The Augustan Age--Orators and rhetoricians--Importance of the Latin literature and language--Arts--Sculpture and painting-- Architecture--Characteristics of Roman architecture--Rome and its monuments.

ROMAN LAW. The Twelve Tables--Symbolic process--Formalism-- Jurisprudence--The praetor's edict--Civil law and the law of nations--Written reason.

CHAPTER XXVI

THE CHRISTIAN RELIGION. Origin of Christianity--Christ--Charity-- Equality--Poverty and humility--The kingdom of God.

FIRST CENTURIES OF THE CHURCH. Disciples and apostles--The church-- Sacred books--Persecutions--Martyrs--Catacombs.

THE MONKS OF THE THIRD CENTURY. Solitaries--Asceticism--Cenobites.

CHAPTER XXVII

THE LATER EMPIRE. The revolutions of the third century--Military anarchy--Worship of Mithra--Taurobolia--Confusion of religions.

REGIME OF THE LATER EMPIRE. Reforms of Diocletian and Constantine-- Constantinople--The palace--The officials--Society of the later empire.

CHURCH AND STATE. Triumph of Christianity--Organization of the church--Councils--Heretics--Paganism--Theodosius.

CHAPTER I

THE ORIGINS OF CIVILIZATION

PREHISTORIC ARCHAEOLOGY

=Prehistoric Remains.=--One often finds buried in the earth, weapons, implements, human skeletons, debris of every kind left by men of whom we have no direct knowledge. These are dug up by the thousand in all the provinces of France, in Switzerland, in England, in all Europe; they are found even in Asia and Africa. It is probable that they exist in all parts of the world.

These remains are called prehistoric because they are more ancient than written history. For about fifty years men have been engaged in recovering and studying them. Today most museums have a hall, or at least, some cases filled with these relics. A museum at Saint-German-en-Laye, near Paris, is entirely given up to prehistoric remains. In Denmark is a collection of more than

30,000 objects. Every day adds to the discoveries as excavations are made, houses built, and cuts made for railroads.

These objects are not found on the surface of the ground, but ordinarily buried deeply where the earth has not been disturbed. They are recovered from a stratum of gravel or clay which has been deposited gradually and has fixed them in place safe from the air, a sure proof that they have been there for a long time.

=Prehistoric Science.=--Scholars have examined the debris and have asked themselves what men have left them. From their skeletons, they have tried to construct their physical appearance; from their tools, the kind of life they led. They have determined that these instruments resemble those used by certain savages today. The study of all these objects constitutes a new science, Prehistoric Archaeology.[1]

=The Four Ages.=--Prehistoric remains come down to us from very diverse races of men; they have been deposited in the soil at widely different epochs since the time when the mammoth lived in western Europe, a sort of gigantic elephant with woolly hide and curved tusks. This long lapse of time may be divided into four periods, called Ages:

1. The Rough Stone Age.

2. The Polished Stone Age.

3. The Bronze Age.

4. The Iron Age.

The periods take their names from the materials used in the manufacture of the tools,--stone, bronze, iron. These epochs, however, are of very unequal length. It may be that the Rough Stone Age was ten times as long as the Age of Iron.

THE ROUGH STONE AGE

=Gravel Debris.=--The oldest remains of the Stone Age have been found in the gravels. A French scholar found between 1841 and 1853, in the valley of the Somme, certain sharp instruments made of flint. They were buried to a depth of six metres in gravel under three layers of clay, gravel, and marl which had never been broken up. In the same place they discovered bones of cattle, deer, and elephants. For a long time people made light of this discovery. They said that the chipping of the flints was due to chance. At last, in 1860, several scholars came to study the remains in the valley of the Somme and recognized that the flints had certainly been cut by men. Since then there have been found more than 5,000 similar flints in strata of the same order either in the valley of the Seine or in England, and some of them by the side of human bones. There is no longer any doubt that men were living at the epoch when the gravel strata were in process of formation. If the strata that cover these remains have always been deposited as slowly as they are today, these men whose bones and tools we unearth must have lived more than 200,000 years ago.

=The Cave Men.=--Remains are also found in caverns cut in rock, often above a river. The most noted are those on the banks of the Vezere, but they exist in many other places. Sometimes they have been used as habitations and even as graves for men. Skeletons, weapons, and tools are found here together. There are axes, knives, scrapers, lance-points of flint; arrows, harpoon-points, needles of bone like those used by certain savages to this day. The soil is strewn with the bones of animals which these men, untidy like all savages, threw into a corner after they had eaten the meat; they even split the bones to extract the marrow just as savages do now. Among the animals are found not only the hare, the deer, the ox, the horse, the salmon, but also the rhinoceros, the cave-bear, the mammoth, the elk, the bison, the reindeer, which are all extinct or have long disappeared from France. Some designs have been discovered engraved on the bone of a reindeer or on the tusk of a mammoth. One of these represents a combat of reindeer; another a mammoth with woolly hide and curved tusks. Doubtless these men were the contemporaries of the mammoth and the reindeer. They were, like the Esquimaux of our day, a race of hunters and fishermen, knowing how to work in flint and to kindle fires.

POLISHED STONE AGE

=Lake Dwellings.=--In 1854, Lake Zurich being very low on account of the unusual dryness of the summer, dwellers on the shore of the lake found, in the mud, wooden piles which had been much eaten away, also some rude utensils. These were the remains of an ancient village built over the water. Since this time more than 200 similar villages have been found in the lakes of Switzerland. They have been called Lake Villages. The piles on which they rest are trunks of trees, pointed and driven into the lake-bottom to a depth of several yards. Every village required 30,000 to 40,000 of these.

A wooden platform was supported by the pile work and on this were built wooden houses covered with turf. Objects found by the hundred among the piles reveal the character of the life of the former inhabitants. They ate animals killed in the chase--the deer, the boar, and the elk. But they were already acquainted with such domestic animals as the ox, the goat, the sheep, and the dog. They knew how to till the ground, to reap, and to grind their grain; for in the ruins of their villages are to be found grains of wheat and even fragments of bread, or rather unleavend cakes. They wore coarse cloths of hemp and sewed them into garments with needles of bone. They made pottery but were very awkward in its manufacture. Their vases were poorly burned, turned by hand, and adorned with but few lines. Like the cave-men, they used knives and arrows of flint; but they made their axes of a very hard stone which they had learned to polish. This is why we call their epoch the Polished Stone Age. They are much later than the cave-men, for they know neither the mammoth nor the rhinoceros, but still are acquainted with the elk and the reindeer.[2]

=Megalithic Monuments.=--Megalith is the name given to a monument formed of enormous blocks of rough stone. Sometimes the rock is bare, sometimes covered with a mass of earth. The buried monument is called a _Tumulus_ on account of its resemblance to a hill. When it is opened, one finds within a chamber of rock, sometimes paved with flag-stones. The monuments whose stone is above ground are of various sorts. The _Dolmen_, or table of rock, is formed of a long stone laid flat over other stones set in the ground. The _Cromlech_, or stone-circle, consists of massive rocks arranged in a circle. The _Menhir_ is a block of stone standing on its end. Frequently several menhirs are ranged in line. At Carnac in Brittany four thousand menhirs in eleven rows are still standing. Probably there were once ten thousand of these in this locality. Megalithic monuments appear by hundreds in western France, especially in Brittany; almost every hill in England has them; the Orkney Islands alone contain more than two thousand. Denmark and North Germany are studded with them; the people of the country call the tumuli the tombs of the giants.

Megalithic monuments are encountered outside of Europe--in India, and on the African coast. No one knows what people possessed the power to quarry such masses and then transport and erect them. For a long time it was believed that the people were the ancient Gauls, or Celts, whence the name Celtic Monuments. But why are like remains found in Africa and in India?

When one of these tumuli still intact is opened, one always sees a skeleton, often several, either sitting or reclining; these monuments, therefore, were used as tombs. Arms, vases, and ornaments are placed at the side of the dead. In the oldest of these tombs the weapons are axes of polished stone; the ornaments are shells, pearls, necklaces of bone or ivory; the vases are very simple, without handle or neck, decorated only with lines or with points. Calcined bones of animals lie about on the ground, the relics of a funeral repast laid in the tomb by the friends of the dead. Amidst these bones we no longer find those of the reindeer, a fact which proves that these monuments were constructed after the disappearance of this animal from western Europe, and therefore at a time subsequent to that of the lake villages.

THE AGE OF BRONZE

=Bronze Age.=--As soon as men learned to smelt metals, they preferred these to stone in the manufacture of weapons. The metal first to be used was copper, easier to extract because found free, and easier to manipulate since it is malleable without the application of heat. Pure copper, however, was not employed, as weapons made of it were too fragile; but a little tin was mixed with it to give it more resistance. It is this alloy of copper and tin that we call bronze.

=Bronze Utensils.=--Bronze was used in the manufacture of ordinary tools--knives, hammers, saws, needles, fish-hooks; in the fabrication of ornaments--bracelets, brooches, ear-rings; and especially in the making of arms--daggers, lance-points, axes, and swords. These objects are found by thousands throughout Europe in the mounds, under the more recent dolmens, in the turf-pits of Denmark, and in rock-tombs. Near these objects of bronze, ornaments of gold are often seen and, now and then, the remains of a woollen garment. It cannot be due to chance that all implements of bronze are similar and all are made according to the same alloy. Doubtless they revert to the same period of time and are anterior to the coming of the Romans into Gaul, for they are never discovered in the midst of debris of the Roman period. But what men used them? What people invented bronze? Nobody knows.

THE IRON AGE

=Iron.=--As iron was harder to smelt and work than bronze, it was later that men learned how to use it. As soon as it was appreciated that iron was harder and cut better than bronze, men preferred it in the manufacture of arms. In Homer's time iron is still a precious metal reserved for swords, bronze being retained for other purposes. It is for this reason that many tombs contain confused remains of utensils of bronze and weapons of iron.

=Iron Weapons.=--These arms are axes, swords, daggers, and bucklers. They are ordinarily found by the side of a skeleton in a coffin of stone or wood, for warriors had their arms buried with them. But they are found also scattered on ancient battle-fields or lost at the bottom of a marsh which later became a turf-pit. There were found in a turf-pit in Schleswig in one day 100 swords, 500 lances, 30 axes, 460 daggers, 80 knives, 40 stilettos--and all of iron. Not far from there in the bed of an ancient lake was discovered a great boat 66 feet long, fully equipped with axes, swords, lances, and knives.

It is impossible to enumerate the iron implements thus found. They have not been so well preserved as the bronze, as iron is rapidly eaten away by rust. At the first glance, therefore, they appear the older, but in reality are more recent.

=Epoch of the Iron Age.=--The inhabitants of northern Europe knew iron before the coming of the Romans, the first century before Christ. In an old cemetery near the salt mines of Hallstadt in Austria they have opened 980 tombs filled with instruments of iron and bronze without finding a single piece of Roman money. But the Iron Age continued under the Romans. Almost always iron objects are found accompanied by ornaments of gold and silver, by Roman pottery, funeral urns, inscriptions, and Roman coins bearing the effigy of the emperor. The warriors whom we find lying near their sword and their buckler lived for the most part in a period quite close to ours, many under the Merovingians, some even at the time of Charlemagne. The Iron Age is no longer a prehistoric age.

CONCLUSIONS

=How the Four Ages are to be Conceived.=--The inhabitants of one and the same country have successively made use of rough stone, polished stone, bronze, and iron. But all countries have not lived in the same age at the same time. Iron was employed by the Egyptians while yet the Greeks were in their bronze age and the barbarians of Denmark were using stone. The conclusion of the polished stone age in America came only with the arrival of Europeans. In our own time the savages of Australia are still in the rough stone age. In their settlements may be found only implements of bone and stone similar to those used by the cave-men. The four ages, therefore, do not mark periods in the life of humanity, but only epochs in the civilization of each country.

=Uncertainties.=--Prehistoric archaeology is yet a very young science. We have learned something of primitive men through certain remains preserved and discovered by chance. A recent accident, a trench, a landslip, a drought may effect a new discovery any day. Who knows what is still under ground? The finds are already innumerable. But these rarely tell us what we wish to know. How long was each of the four ages? When did each begin and end in the various parts of the world? Who planned the caverns, the lake villages, the mounds, the dolmens? When a country passes from polished stone to bronze, is it the same people changing implements, or is it a new people come on the scene? When one thinks one has found the solution, a new discovery often confounds the archaeologists. It was thought that the Celts originated the dolmens, but these have been found in sections which could never have been traversed by Celts.

=What has been determined.=--Three conclusions, however, seem certain:

1.--Man has lived long on the earth, familiar as he was with the mammoth and the cave-bear; he lived at least as early as the geological period known as the Quaternary.

2.--Man has emerged from the savage state to civilized life; he has gradually perfected his tools and his ornaments from the awkward axe of flint and the necklace of bears' teeth to iron swords and jewels of gold. The roughest instruments are the oldest.

3.--Man has made more and more rapid progress. Each age has been shorter than its predecessor.

FOOTNOTES:

[1] It originated especially with French, Swiss, and scholars.

[2] According to Lubbock (Prehistoric Times, N.Y., 1890, p. 212) the reindeer was not known to the Second Stone Age.--ED.

CHAPTER II

HISTORY AND THE RECORDS

HISTORY

=Legends.=--The most ancient records of people and their doings are transmitted by oral tradition. They are recited long before they are written down and are much mixed with fable. The Greeks told how their heroes of the oldest times had exterminated monsters, fought with giants, and battled against the gods. The Romans had Romulus nourished by a wolf and raised to heaven. Almost all peoples relate such stories of their infancy. But no confidence is to be placed in these legends.

=History.=--History has its true beginning only with authentic accounts, that is to say, accounts written by men who were well informed. This moment is not the same with all peoples. The history of Egypt commences more than 3,000 years before Christ; that of the Greeks ascends scarcely to 800 years before Christ; Germany has had a history only since the first century of our era; Russia dates back only to the ninth century; certain savage tribes even yet have no history.

=Great Divisions of History.=--The history of civilization begins with the oldest civilized people and continues to the present time. Antiquity is the most remote period, Modern Times the era in which we live.

=Ancient History.=--Ancient History begins with the oldest known nations, the Egyptians and Chaldeans (about 3,000 years before our era), and surveys the peoples of the Orient, the Hindoos, Persians, Phoenicians, Jews, Greeks, and last of all the Romans. It terminates about the fifth century A.D., when the Roman empire of the west is extinguished.

=Modern History.=--Modern History starts with the end of the fifteenth century, with the invention of printing, the discovery of America and of the Indies, the Renaissance of the sciences and arts. It concerns itself especially with peoples of the West, of Spain, Italy, France, Germany, Russia, and America.

=The Middle Age.=--Between Antiquity and Modern Times about ten centuries elapse which belong neither to ancient times (for the civilization of Antiquity has perished) nor to modern (since modern civilization does not yet exist). This period we call the Middle Age.

SOURCES OF INFORMATION FOR THE HISTORY OF ANCIENT PEOPLES

=The Sources.=--The Assyrians, Greeks, and Romans are no longer with us; all the peoples of antiquity have passed away. To know their religion, their customs, and arts we have to seek for instruction in the remains they have left us. These are books, monuments, inscriptions, and languages, and these are our means for the study of ancient civilizations. We term these _sources_ because we draw our knowledge from them. Ancient History flows from these sources.

=Books.=--Ancient peoples have left written records behind them. Some of these peoples had sacred books--for example, the Hindoos, the Persians, and the Jews; the Greeks and Romans have handed down to us histories, poems, speeches, philosophical treatises. But books are very far from furnishing all the information that we require. We do not possess a single Assyrian or Phoenician book. Other peoples have transmitted very few books to us. The ancients wrote less than we, and so they had a smaller literature to leave behind them; and as it was necessary to transcribe all of this by hand, there was but a small number of copies of books. Further, most of these manuscripts have been destroyed or have been lost, and those which remain to us are difficult to read. The art of deciphering them is called Palaeography.

=The Monuments.=--Ancient peoples, like ourselves, built monuments of different sorts: palaces for their kings, tombs for the dead, fortresses, bridges, aqueducts, triumphal arches. Of these monuments many have fallen into ruin, have been razed, shattered by the enemy or by the people themselves. But some of them survive, either because there was no desire to destroy them, or because men could not. They still stand in ruins like the old castles, for repairs are no longer made; but enough is preserved to enable us to comprehend their former condition. Some of them are still above ground, like the pyramids, the temples of Thebes and of the island of Philae, the palace of Persepolis in Persia, the Parthenon in Greece, the Colosseum in Rome, and the Maison Carree and Pont du Gard in France. Like any modern monument, these are visible to the traveller. But the majority of these monuments have been recovered from the earth, from sand, from river deposits, and from debris. One must disengage them from this thick covering, and excavate the soil, often to a great depth. Assyrian palaces may be reached only by cutting into the hills. A trench of forty feet is necessary to penetrate to the tombs of the kings of Mycenae. Time is not the only agency for covering these ruins; men have aided it. When the ancients wished to build, they did not, as we do, take the trouble to level off the space, nor to clear the site. Instead of removing the debris, they heaped it together and built above it. The new edifice in turn fell into ruins and its debris was added to that of more remote time; thus there were formed several strata of remains. When Schliemann excavated the site of Troy, he had passed through five beds of debris; these were five ruined villages one above another, the oldest at a depth of fifty feet.

By accident one town has been preserved to us in its entirety. In 79 A.D. the volcano of Vesuvius belched forth a torrent of liquid lava and a rain of ashes, and two Roman cities were suddenly buried, Herculaneum by lava, and Pompeii by ashes; the lava burnt the objects it touched, while the ashes enveloped them, preserving them from the air and keeping them intact. As we remove the ashes, Pompeii reappears to us just as it was eighteen centuries ago. One still sees the wheel-ruts in the pavement, the designs traced on the walls with charcoal; in the houses, the pictures, the utensils, the furniture, even the bread, the nuts, and olives, and here and there the skeleton of an inhabitant surprised by the catastrophe. Monuments teach us much about the ancient peoples. The science of monuments is called Archaeology.

=Inscriptions.=--By inscriptions one means all writings other than books. Inscriptions are for the most part cut in stone, but some are on plates of bronze. At Pompeii they have been found traced on the walls in colors or with charcoal. Some have the character of commemorative inscriptions just as these are now attached to our statues and edifices; thus in the monument of Ancyra the emperor Augustus publishes the story of his life.

The greatest number of inscriptions are epitaphs graven on tombs. Certain others fill the function of our placards, containing, as they do, a law or a regulation that was to be made public. The science of inscriptions is called Epigraphy.

=Languages.=--The languages also which ancient peoples spoke throw light on their history. Comparing the words of two different languages, we perceive that the two have a common origin--an evidence that the peoples who spoke them were descended from the same stock. The science of languages is called Linguistics.

=Lacunae.=--It is not to be supposed that books, monuments, inscriptions, and languages are sufficient to give complete knowledge of the history of antiquity. They present many details which we could well afford to lose, but often what we care most to know escapes us. Scholars continue to dig and to decipher; each year new discoveries of inscriptions and monuments are made; but there remain still many gaps in our knowledge and probably some of these will always exist.

RACES AND PEOPLES

=Anthropology.=--The men who people the earth do not possess exact resemblances, some differing from others in stature, the form of the limbs and the head, the features of the face, the color of the hair and eyes. Other differences are found in language, intelligence, and sentiments. These variations permit us to separate the inhabitants of the earth into several groups which we call races. A _race_ is the aggregate of those men who resemble one another and are distinguished from all others. The common traits of a race--its characteristics--constitute the type of the race. For example, the type of the negro race is marked by black skin, frizzly hair, white teeth, flat nose, projecting lips, and prominent jaw. That part of Anthropology which concerns itself with races and their sub-divisions is called Ethnology.[3] This science is yet in its early development on account of its complete novelty, and is very complex since types of men are very numerous and often very difficult to differentiate.

=The Races.=--The principal races are:

1.--The White race, which inhabits Europe, the north of Africa, and western Asia.

2.--The Yellow race in eastern Asia to which belong the Chinese, the Mongols, Turks, and Hungarians, who invaded Europe as conquerors. They have yellow skin, small regular eyes, prominent cheek-bones, and thin beard.

3.--The Black race, in central Africa. These are the Negroes, of black skin, flat nose, woolly hair.

4.--The Red race, in America. These are the Indians, with copper-colored skin and flat heads.

=Civilized Peoples.=--Almost all civilized peoples belong to the white race. The peoples of the other races have remained savage or barbarian, like the men of prehistoric times.[4]

It is within the limits of Asia and Africa that the first civilized peoples had their development--the Egyptians in the Nile valley, the Chaldeans in the plain of the Euphrates. They were peoples of sedentary and peaceful pursuits. Their skin was dark, the hair short and thick, the lips strong. Nobody knows their origin with exactness and scholars are not agreed on the name to give them (some terming them Cushites, others Hamites). Later, between the twentieth and twenty-fifth centuries B.C. came bands of martial shepherds who had spread over all Europe and the west of Asia--the Aryans and the Semites.

=The Aryans and the Semites.=--There is no clearly marked external difference between the Aryans and the Semites. Both are of the white race, having the oval face, regular features, clear skin, abundant hair, large eyes, thin lips, and straight nose. Both peoples were originally nomad shepherds, fond of war. We do not know whence they came, nor is there agreement whether the Aryans came from the mountain region in the northwest of the Himalayas or from the plains of Russia. What distinguishes them is their spiritual bent and especially their language, sometimes also their religion. Scholars by common consent call those peoples Aryan who speak an Aryan language: in Asia, the Hindoos and Persians; in Europe, the Greeks, Italians, Spaniards, Germans, Scandinavians, Slavs (Russians, Poles, Serfs), and Celts.[5]

Similarly, we call Semites those peoples who speak a Semitic language: Arabs, Jews and Syrians. But a people may speak an Aryan or a Semitic language and yet not be of Aryan or Semitic race; a negro may speak English without being of English stock. Many of the Europeans whom we classify among the Aryans are perhaps the descendants of an ancient race conquered by the Aryans and who have adopted their language, just as the Egyptians received the language of the Arabs, their conquerors.

These two names (Aryan and Semite), then, signify today rather two groups of peoples than two distinct races. But even if we use the terms in this sense, one may say that all the greater peoples of the world have been Semites or Aryans. The Semitic family included the Phoenicians, the people of commerce; the Jews, the people of religion; the Arabs, the people of war. The Aryans, some finding their homes in India, others in Europe, have produced the nations which have been, and still are, foremost in the world--in antiquity, the Hindoos, a people of great philosophical and religious ideas; the Greeks, creators of art and of science; the Persians and Romans, the founders, the former in the East, the latter in the West, of the greatest empires of antiquity; in modern times, the Italians, French, Germans, Dutch, Russians, English and Americans.

The history of civilization begins with the Egyptians and the Chaldeans; but from the fifteenth century before our era, history concerns itself only with the Aryan and Semitic peoples.

FOOTNOTES:

[3] Ethnography is the study of races from the point of view of their objects and customs.

[4] The Chinese only of the yellow race have elaborated among themselves an industry, a regular government, a polite society. But placed at the extremity of Asia they have had no influence on other civilized peoples. [The Japanese should be included.--ED.]

[5] The English and French are mixtures of Celtic and German blood.

CHAPTER III

ANCIENT HISTORY OF THE EAST

THE EGYPTIANS

=The Land of Egypt.=--Egypt is only the valley of the Nile, a narrow strip of fertile soil stretching along both banks of the stream and shut in by mountains on either side, somewhat over 700[6] miles in length and 15 in width. Where the hills fall away, the Delta begins, a vast plain cut by the arms of the Nile and by canals. As Herodotus says, Egypt is wholly the gift of the Nile.

=The Nile.=--Every year at the summer solstice the Nile, swollen by the melted snows of Abyssinia, overflows the parched soil of Egypt. It rises to a height of twenty-six or twenty-seven feet, sometimes even to thirty-three feet.[7] The whole country becomes a lake from which the villages, built on eminences, emerge like little islands. The water recedes in September; by December it has returned to its proper channel. Everywhere has been left a fertile, alluvial bed which serves the purpose of fertilization. On the softened earth the peasant sows his crop with almost no labor. The Nile, then, brings both water and soil to Egypt; if the river should fail, Egypt would revert, like the land on either side of it, to a desert of sterile sand where the rain never falls. The Egyptians are conscious of their debt to their stream. A song in its honor runs as follows: "Greeting to thee, O Nile, who hast revealed thyself throughout the land, who comest in peace to give life to Egypt. Does it rise? The land is filled with joy, every heart exults, every being receives its food, every mouth is full. It brings bounties that are full of delight, it creates all good things, it makes the grass to spring up for the beasts."

=Fertility of the Country.=--Egypt is truly an oasis in the midst of the desert of Africa. It produces in abundance wheat, beans, lentils, and all leguminous foods; palms rear themselves in forests. On the pastures irrigated by the Nile graze herds of cattle and

goats, and flocks of geese. With a territory hardly equal to that of Belgium, Egypt still supports 5,500,000 inhabitants. No country in Europe is so thickly populated, and Egypt in antiquity was more densely thronged than it is today.

=The Accounts of Herodotus.=--Egypt was better known to the Greeks than the rest of the Orient. Herodotus had visited it in the fifth century B.C. He describes in his History the inundations of the Nile, the manners, costume, and religion of the people; he recounts events of their history and tales which his guides had told him. Diodorus and Strabo also speak of Egypt. But all had seen the country in its decadence and had no knowledge of the ancient Egyptians.

=Champollion.=--The French expedition to Egypt (1798-1801) opened the country to scholars. They made a close examination of the Pyramids and ruins of Thebes, and collected drawings and inscriptions. But no one could decipher the hieroglyphs, the Egyptian writing. It was an erroneous impression that every sign in this writing must each represent a word. In 1821 a French scholar, Champollion, experimented with another system. An official had reported that there was an inscription at Rosetta in three forms of writing--parallel with the hieroglyphs was a translation in Greek. The name of King Ptolemy, was surrounded with a cartouche.[8] Champollion succeeded in finding in this name the letters P, T, O, L, M, I, S. Comparing these with other names of kings similarly enclosed, he found the whole alphabet. He then read the hieroglyphs and found that they were written in a language like the Coptic, the language spoken in Egypt at the time of the Romans, and which was already known to scholars.

=Egyptologists.=--Since Champollion, many scholars have travelled over Egypt and have ransacked it thoroughly. We call these students Egyptologists, and they are to be found in every country of Europe. A French Egyptologist, Mariette (1821-1881), made some excavations for the Viceroy of Egypt and created the museum of Boulak. France has established in Cairo a school of Egyptology, directed by Maspero.

=Discoveries.=--Not every country yields such rich discoveries as does Egypt. The Egyptians constructed their tombs like houses, and laid in them objects of every kind for the use of the dead--furniture, garments, arms, and edibles. The whole country was filled with tombs similarly furnished. Under this extraordinarily dry climate everything has been preserved; objects come to light intact after a burial of 4,000 or 5,000 years. No people of antiquity have left so many traces of themselves as the Egyptians; none is better known to us.

THE EGYPTIAN EMPIRE

=Antiquity of the Egyptian People.=--An Egyptian priest said to Herodotus, "You Greeks are only children." The Egyptians considered themselves the oldest people of the world. Down to the Persian conquest (520[9] B.C.) there were twenty-six dynasties of kings. The first ran back 4,000 years,[10] and during these forty centuries Egypt had been an empire. The capital down to the tenth dynasty (the period of the Old Empire) was at Memphis in Lower Egypt, later, in the New Empire, at Thebes in Upper Egypt.

=Memphis and the Pyramids.=--Memphis, built by the first king of Egypt, was protected by an enormous dike. The village has existed for more than five thousand years; but since the thirteenth century the inhabitants have taken the stones of its ruins to build the houses of Cairo; what these people left the Nile recaptured. The Pyramids, not far from Memphis, are contemporaneous with the old empire; they are the tombs of three kings of the fourth dynasty. The greatest of the pyramids, 480 feet high, required the labor of 100,000 men for thirty years.[11] To raise the stones for it they built gradually ascending platforms which were removed when the structure was completed.

=Egyptian Civilization.=--The statues, paintings, and instruments which are taken from the tombs of this epoch give evidence of an already civilized people. When all the other eminent nations of antiquity--the Hindoos, Persians, Jews, Greeks, Romans--were still in a savage state, 3,500 years before our era, the Egyptians had known for a long time how to cultivate the soil, to weave cloths, to work metals, to paint, sculpture, and to write; they had an organized religion, a king, and an administration.

=Thebes.=--At the eleventh dynasty Thebes succeeds Memphis as capital. The ruins of Thebes are still standing. They are marvellous, extending as they do on both banks of the Nile, with a circuit of about seven miles. On the left bank there is a series of palaces and temples which lead to vast cemeteries. On the right bank two villages, Luxor and Karnak, distant a half-hour one from the other, are built in the midst of the ruins. They are united by a double row of sphinxes, which must have once included more than 1,000 of these monuments. Among these temples in ruins the greatest was the temple of Ammon at Karnak. It was surrounded by a wall of over one and one-third miles in length; the famous Hall of Columns, the greatest in the world, had a length of 334 feet, a width of 174 feet,[12] and was supported by 134 columns; twelve of these are over 65 feet high. Thebes was for 1,500 years the capital and sacred city, the residence of kings and the dwelling-place of the priests.

=The Pharaoh.=--The king of Egypt, called Pharaoh, was esteemed as the son of the Sun-god and his incarnation on earth; divinity was ascribed to him also. We may see in a picture King Rameses II standing in adoration before the divine Rameses who is sitting between two gods. The king as man adores himself as god. Being god, the Pharaoh has absolute power over men; as master, he gives his orders to his great nobles at court, to his warriors, to all his subjects. But the priests, though adoring him, surround and watch him; their head, the high priest of the god Ammon, at last becomes more powerful than the king; he often governs under the name of the king and in his stead.

=The Subjects of Pharaoh.=--The king, the priests, the warriors, the nobles, are proprietors of all Egypt; all the other people are simply their peasants who cultivate the land for them. Scribes in the service of the king watch them and collect the farm-dues, often with blows of the staff. One of these functionaries writes as follows to a friend, "Have you ever pictured to yourself the existence of the peasant who tills the soil. The tax-collector is on the platform busily seizing the tithe of the harvest. He has his men with him armed with staves, his negroes provided with strips of palm. All cry, 'Come, give us grain,' If the peasant hasn't it, they throw him full length on the earth, bind him, draw him to the canal, and hurl him in head foremost."

=Despotism.=--The Egyptian people has always been, and still is, gay, careless, gentle, docile as an infant, always ready to submit to tyranny. In this country the cudgel was the instrument of education and of government. "The young man," said the scribes, "has a back to be beaten; he hears when he is struck." "One day," says a French traveller, "finding myself before the ruins of Thebes, I exclaimed, 'But how did they do all this?' My guide burst out laughing, touched me on the arm and, showing me a palm, said to me, 'Here is what they used to accomplish all this. You know, sir, with 100,000 branches of palms split on the backs of those who always have their shoulders bare, you can build many a palace and some temples to boot.'"

=Isolation of the Egyptians.=--The Egyptians moved but little beyond their borders. As the sea inspired them with terror, they had no commerce and did not trade with other peoples. They were not at all a military nation. Their kings, it is true, often went on expeditions at the head of mercenaries either against the negroes of Ethiopia or against the tribes of Syria. They gained victories which they had painted on the walls of their palaces, they brought back troops of captives whom they used in building monuments; but they never made great conquests. Foreigners came more to Egypt than Egyptians went abroad.

=Religion of the Egyptians.=--"The Egyptians," said Herodotus, "are the most religious of all men." We do not know any people so devout; almost all their paintings represent men in prayer before a god; almost all their manuscripts are religious books.

=Egyptian Gods.=--The principal deity is a Sun-god, creator, beneficent, "who knows all things, who exists from the beginning." This god has a divine wife and son. All the Egyptians adored this trinity; but not all gave it the same name. Each region gave a different name to these three gods. At Memphis they called the father Phtah, the mother Sekhet, the son Imouthes; at Abydos they called them Osiris, Isis, and Horus; at Thebes, Ammon, Mouth, and Chons. Then, too, the people of one province adopted the gods of other provinces. Further, they made other gods emanate from each god of the trinity. Thus the number of gods was increased and religion was complicated.

=Osiris.=--These gods have their history; it is that of the sun; for the sun appeared to the Egyptians, as to most of the primitive peoples, the mightiest of beings, and consequently a god. Osiris, the sun, is slain by Set, god of the night; Isis, the moon, his wife, bewails and buries him; Horus, his son, the rising sun, avenges him by killing his murderer.

=Ammon-ra.=--Ammon-ra, god of Thebes, is represented as traversing heaven each day in a bark ("the good bark of millions of years"); the shades of the dead propel it with long oars; the god stands at the prow to strike the enemy with his lance. The hymn which they chanted in his honor is as follows: "Homage to thee; thou watchest favoringly, thou watchest truly, O master of the two horizons.... Thou treadest the heavens on high, thine enemies are laid low. The heaven is glad, the earth is joyful, the gods unite in festal cheer to render glory to Ra when they see him rising in his bark after he has overwhelmed his enemies. O Ra, give abounding life to Pharaoh, bestow bread for his hunger (belly), water for his throat, perfumes for his hair."

=Animal-Headed Gods.=--The Egyptians often represented their gods with human form, but more frequently under the form of a beast. Each god has his animal: Phtah incarnates himself in the beetle, Horus in the hawk, Osiris in the bull. The two figures often unite in a man with the head of an animal or an animal with the head of a man. Every god may be figured in four forms: Horus, for example, as a man, a hawk, as man with the head of a hawk, as a hawk with the head of a man.

=Sacred Animals.=--What did the Egyptians wish to designate by this symbol? One hardly knows. They, themselves, came to regard as sacred the animals which served to represent the gods to them: the bull, the beetle, the ibis, the hawk, the cat, the

crocodile. They cared for them and protected them. A century before the Christian era a Roman citizen killed a cat at Alexandria; the people rose in riot, seized him, and, notwithstanding the entreaties of the king, murdered him, although at the same time they had great fear of the Romans. There was in each temple a sacred animal which was adored. The traveller Strabo records a visit to a sacred crocodile of Thebes: "The beast," said he, "lay on the edge of a pond, the priests drew near, two of them opened his mouth, a third thrust in cakes, grilled fish, and a drink made with meal."

=The Bull Apis.=--Of these animal gods the most venerated was the bull Apis. It represented at once Osiris and Phtah and lived at Memphis in a chapel served by the priests. After its death it became an Osiris (Osar-hapi), it was embalmed, and its mummy deposited in a vault. The sepulchres of the "Osar-hapi" constituted a gigantic monument, the Serapeum, discovered in 1851 by Marietta.

=Cult of the Dead.=--The Egyptians adored also the spirits of the dead. They seem to have believed at first that every man had a "double" (Ka), and that when the man was dead his double still survived. Many savage peoples believe this to this day. The Egyptian tomb in the time of the Old Empire was termed "House of the Double." It was a low room arranged like a chamber, where for the service of the double there were placed all that he required, chairs, tables, beds, chests, linen, closets, garments, toilet utensils, weapons, sometimes a war-chariot; for the entertainment of the double, statues, paintings, books; for his sustenance, grain and foods. And then they set there a double of the dead in the form of a statue in wood or stone carved in his likeness. At last the opening to the vault was sealed; the double was enclosed, but the living still provided for him. They brought him foods or they might beseech a god that he supply them to the spirit, as in this inscription, "An offering to Osiris that he may confer on the Ka of the deceased N. bread, drink, meat, geese, milk, wine, beer, clothing, perfumes--all good things and pure on which the god (_i.e._ the Ka) subsists."

=Judgment of the Soul.=--Later, originating with the eleventh dynasty, the Egyptians believed that the soul flew away from the body and sought Osiris under the earth, the realm into which the sun seemed every day to sink. There Osiris sits on his tribunal, surrounded by forty-two judges; the soul appears before these to give account of his past life. His actions are weighed in the balance of truth, his "heart" is called to witness. "O heart," cries the dead, "O heart, the issue of my mother, my heart when I was on earth, offer not thyself as witness, charge me not before the great god." The soul found on examination to be bad is tormented for centuries and at last annihilated. The good soul springs up across the firmament; after many tests it rejoins the company of the gods and is absorbed into them.

=Mummies.=--During this pilgrimage the soul may wish to re-enter the body to rest there. The body must therefore be kept intact, and so the Egyptians learned to embalm it. The corpse was filled with spices, drenched in a bath of natron, wound with bandages and thus transformed into a mummy. The mummy encased in a coffin of wood or plaster was laid in the tomb with every provision necessary to its life.

=Book of the Dead.=--A book was deposited with the mummy, the Book of the Dead, which explains what the soul ought to say in the other world when it makes its defence before the tribunal of Osiris: "I have never committed fraud; ... I have never vexed the widow; ... I have never committed any forbidden act; ... I have never been an idler; ... I have never taken the slave from his master; ... I never stole the bread from the temples; ... I never removed the provisions or the bandages of the dead; I never altered the grain measure; ... I never hunted sacred beasts; I never caught sacred fish; ... I am pure; ... I have given bread to the hungry, water to the thirsty, clothing to the naked; I have sacrificed to the gods, and offered funeral feasts to dead." Here we see Egyptian morality: observance of ceremonies, respect for everything pertaining to the gods, sincerity, honesty, and beneficence.

THE ARTS

=Industry.=--The Egyptians were the first to practice the arts necessary to a civilized people. From the first dynasty, 3,000[13] years B.C., paintings on the tomb exhibit men working, sowing, harvesting, beating and winnowing grain; we have representations of herds of cattle, sheep, geese, swine; of persons richly clothed, processions, feasts where the harp is played--almost the same life that we behold 3,000 years later. As early as this time the Egyptians knew how to manipulate gold, silver, bronze; to manufacture arms and jewels, glass, pottery, and enamel; they wove garments of linen and wool, and cloths, transparent or embroidered with gold.

=Architecture.=--They were the oldest artists of the world. They constructed enormous monuments which appear to be eternal, for down to the present, time has not been able to destroy them. They never built, as we do, for the living, but for the gods and for the dead, _i.e._, temples and tombs. Only a slight amount of debris is left of their houses, and even the palaces of their kings in

comparison with the tombs appear, in the language of the Greeks, to be only inns. The house was to serve only for a lifetime, the tomb for eternity.

=Tombs.=--The Great Pyramid is a royal tomb. Ancient tombs ordinarily had this form. In Lower Egypt there still remain pyramids arranged in rows or scattered about, some larger, others smaller. These are the tombs of kings and nobles. Later the tombs are constructed underground, some under earth, others cut into the granite of the hills. Each generation needs new ones, and therefore near the town of living people is built the richer and greater city of the dead (necropolis).

=Temples.=--The gods also required eternal and splendid habitations. Their temples include a magnificent sanctuary, the dwelling of the god, surrounded with courts, gardens, chambers where the priests lodge, wardrobes for his jewels, utensils, and vestments. This combination of edifices, the work of many generations, is encircled with a wall. The temple of Ammon at Thebes had the labors of the kings of all the dynasties from the twelfth to the last. Ordinarily in front of the temple a great gate-way is erected, with inclined faces--the pylone. On either side of the entrance is an obelisk, a needle of rock with gilded point, or perhaps a colossus in stone representing a sitting giant. Often the approach to the temple is by a long avenue rimmed with sphinxes.

Pyramids, pylones, colossi, sphinxes, and obelisks characterize this architecture. Everything is massive, compact, and, above all, immense. Hence these monuments appear clumsy but indestructible.

=Sculpture.=--Egyptian sculptors began with imitating nature. The oldest statues are impressive for their life and freshness, and are doubtless portraits of the dead. Of this sort is the famous squatting scribe of the Louvre.[14] But beginning with the eleventh dynasty the sculptor is no longer free to represent the human body as he sees it, but must follow conventional rules fixed by religion. And so all the statues resemble one another--parallel legs, the feet joined, arms crossed on the breast, the figure motionless; the statues are often majestic, but always stiff and monotonous. Art has ceased to reproduce nature and is become a conventional symbol.

=Painting.=--The Egyptians used very solid colors; after 5,000 years they are still fresh and bright. But they were ignorant of coloring designs; they knew neither tints, shadows, nor perspective. Painting, like sculpture, was subject to religious rules and was therefore monotonous. If fifty persons were to be represented, the artist made them all alike.

=Literature.=--The literature of the Egyptians is found in the tombs--not only books of medicine, of magic and of piety, but also poems, letters, accounts of travels, and even romances.

=Destiny of the Egyptian Civilization.=--The Egyptians conserved their customs, religion, and arts even after the fall of their empire. Subjects of the Persians, then the Greeks, and at last of the Romans, they kept their old usages, their hieroglyphics, their mummies and sacred animals. At last between the third and second centuries A.D., Egyptian civilization was slowly extinguished.

CHAPTER IV

ASSYRIANS AND BABYLONIANS

CHALDEA

=The Land.=--From the high and snowy mountains of Armenia flow two deep and rapid rivers, the Tigris to the east, the Euphrates to the west. At first in close proximity, they separate as they reach the plain. The Tigris makes a straight course, the Euphrates a great detour towards the sandy deserts; then they unite before emptying into the sea. The country which they embrace is Chaldea. It is an immense plain of extraordinarily fertile soil; rain is rare and the heat is overwhelming. But the streams furnish water and this clayey soil when irrigated by canals becomes the most fertile in the world. Wheat and barley produce 200-fold; in good years the returns are 300-fold. Palms constitute the forests and from these the people make their wine, meal and flour.[15]

=The People.=--For many centuries, perhaps as long as Egypt, Chaldea has been the abode of civilized peoples. Many races from various lands have met and mingled in these great plains. There were Turanians of the yellow race, similar to the Chinese, who came from the north-east; Cushites, deep brown in color, related to the Egyptians, came from the east; Semites, of the white race, of the same stock as the Arabs, descended from the north.[16] The Chaldean people had its origin in this mixture of races.

=The Cities.=--Chaldean priests related that their kings had ruled for 150,000 years. While this is a fable, they were right in ascribing great antiquity to the Chaldean empire. The soil of Chaldea is everywhere studded with hills and each of these is a mass of debris, the residue of a ruined city. Many of these have been excavated and many cities brought to view, (Our, Larsam, Bal-ilou), and some inscriptions recovered. De Sarsec, a Frenchman, has discovered the ruins of an entire city, overwhelmed by the invader and its palace destroyed by fire. These ancient peoples are still little known to us; many sites remain to be excavated when it is hoped new inscriptions will be found. Their empire was destroyed about 2,300 B.C.; it may then have been very old.[17]

THE ASSYRIANS

=Assyria.=--The country back of Chaldea on the Tigris is Assyria. It also is fertile, but cut with hills and rocks. Situated near the mountains, it experiences snow in winter and severe storms in summer.

=Origins.=--Chaldea had for a long time been covered with towns while yet the Assyrians lived an obscure life in their mountains. About the thirteenth century B.C. their kings leading great armies began to invade the plains and founded a mighty empire whose capital was Nineveh.

=Ancient Accounts.=--Until about forty years ago we knew almost nothing of the Assyrians--only a legend recounted by the Greek Diodorus Siculus. Ninus, according to the story, had founded Nineveh and conquered all Asia Minor; his wife, Semiramis, daughter of a goddess, had subjected Egypt, after which she was changed into the form of a dove. Incapable kings had succeeded this royal pair for the space of 1,300 years; the last, Sardanapalus, besieged in his capital, was burnt with his wives. This romance has not a word of truth in it.

=Modern Discoveries.=--In 1843, Botta, the French consul at Mossoul, discovered under a hillock near the Tigris, at Khorsabad, the palace of an Assyrian king. Here for the first time one could view the productions of Assyrian art; the winged bulls cut in stone, placed at the gate of the palace were found intact and removed to the Louvre Museum in Paris. The excavations of Botta drew the attention of Europe, so that many expeditions were sent out, especially by the English; Place and Layard investigated other mounds and discovered other palaces. These ruins had been well preserved, protected by the dryness of the climate and by a covering of earth. They found walls adorned with bas-reliefs and paintings; statues and inscriptions were discovered in great number. It was now possible to study on the ground the plan of the structures and to publish reproductions of the monuments and inscriptions.

The palace first discovered, that of Khorsabad, had been built by King Sargon at Nineveh, the site of the capital of the Assyrian kings. The city was built on several eminences, and was encircled by a wall 25 to 30 miles[18] in length, in the form of a quadrilateral. The wall was composed of bricks on the exterior and of earth within. The dwellings of the city have disappeared leaving no traces, but we have recovered many palaces constructed by various kings of Assyria. Nineveh remained the residence of the kings down to the time that the Assyrian empire was destroyed by the Medes and Chaldeans.

=Inscriptions on the Bricks.=--In these inscriptions every character is formed of a combination of signs shaped like an arrow or wedge, and this is the reason that this style of writing is termed cuneiform (Latin _cuneus_ and _forma_). To trace these signs the writer used a stylus with a triangular point; he pressed it into a tablet of soft clay which was afterwards baked to harden it and to

make the impression permanent. In the palace of Assurbanipal a complete library of brick tablets has been found in which brick serves the purpose of paper.

=Cuneiform Writing.=--For many years the cuneiform writing has occupied the labors of many scholars impatient to decipher it. It has been exceedingly difficult to read, for, in the first place, it served as the writing medium of five different languages--Assyrian, Susian, Mede, Chaldean, and Armenian, without counting the Old Persian--and there was no knowledge of these five languages. Then, too, it is very complicated, for several reasons:

1. It is composed at the same time of symbolic signs, each of which represents a word (sun, god, fish), and of syllabic signs, each of which represents a syllable.

2. There are nearly two hundred syllabic signs, much alike and easy to confuse.

3. The same sign is often the representation of a word and a syllable.

4. Often (and this is the hardest condition) the same sign is used to represent different syllables. Thus the same sign is sometimes read "ilou," and sometimes "an." This writing was difficult even for those who executed it. "A good half of the cuneiform monuments which we possess comprises guides (grammars, dictionaries, pictures), which enable us to decipher the other half, and which we consult just as Assyrian scholars did 2,500 years ago."[19]

Cuneiform inscriptions have been solved in the same manner as the Egyptian hieroglyphics--there was an inscription in three languages--Assyrian, Mede, and Persian. The last gave the key to the other two.

=The Assyrian People.=--The Assyrians were a race of hunters and soldiers. Their bas-reliefs ordinarily represent them armed with bow and lance, often on horseback. They were good knights--alert, brave, clever in skirmish and battle; also bombastic, deceitful, and sanguinary. For six centuries they harassed Asia, issuing from their mountains to hurl themselves on their neighbors, and returning with entire peoples reduced to slavery. They apparently made war for the mere pleasure of slaying, ravaging, and pillaging. No people ever exhibited greater ferocity.

=The King.=--Following Asiatic usage they regarded their king as the representative of God on earth and gave him blind obedience. He was absolute master of all his subjects, he led them in battle, and at their head fought against other peoples of Asia. On his return he recorded his exploits on the walls of his palace in a long inscription in which he told of his victories, the booty which he had taken, the cities burned, the captives beheaded or flayed alive. We present some passages from these stories of campaigns:

Assurnazir-hapal in 882 says, "I built a wall before the great gates of the city; I flayed the chiefs of the revolt and with their skins I covered this wall. Some were immured alive in the masonry, others were crucified or impaled along the wall. I had some of them flayed in my presence and had the wall hung with their skins. I arranged their heads like crowns and their transfixed bodies in the form of garlands."

In 745 Tiglath-Pilezer II writes, "I shut up the king in his royal city. I raised mountains of bodies before his gates. All his villages I destroyed, desolated, burnt. I made the country desert, I changed it into hills and mounds of debris."

In the seventh century Sennacherib wrote: "I passed like a hurricane of desolation. On the drenched earth the armor and arms swam in the blood of the enemy as in a river. I heaped up the bodies of their soldiers like trophies and I cut off their extremities. I mutilated those whom I took alive like blades of straw; as punishment I cut off their hands." In a bas-relief which shows the town of Susa surrendering to Assurbanipal one sees the chiefs of the conquered tortured by the Assyrians; some have their ears cut off, the eyes of others are put out, the beard torn out, while some are flayed alive. Evidently these kings took delight in burnings, massacres, and tortures.

=Ruin of the Assyrian Empire.=--The Assyrian regime began with the capture of Babylon (about 1270). From the ninth century the Assyrians, always at war, subjected or ravaged Babylonia, Syria, Palestine, and even Egypt. The conquered always revolted, and the massacres were repeated. At last the Assyrians were exhausted. The Babylonians and Medes made an alliance and destroyed their empire. In 625 their capital, Nineveh, "the lair of lions, the bloody city, the city gorged with prey," as the Jewish prophets call it, was taken and destroyed forever. "Nineveh is laid waste," says the prophet Nahum, "who will bemoan her?"

THE BABYLONIANS

=The Second Chaldean Empire.=--In the place of the fallen Assyrian empire there arose a new power--in ancient Chaldea. This has received the name Babylonian Empire or the Second Chaldean Empire. A Jewish prophet makes one say to Jehovah, "I raise up the Chaldeans, that bitter and hasty nation which shall march through the breadth of the land to possess dwelling places that are not theirs. Their horses are swifter than leopards. Their horsemen spread themselves; (their horsemen) shall fly as the eagle that hasteth to eat." They were a people of knights, martial and victorious, like the Assyrians. They subjected Susiana, Mesopotamia, Syria, and Jordan. But their regime was short: founded in 625, the Babylonian Empire was overthrown by the Persians in 538 B.C.

=Babylon.=--The mightiest of its kings, Nebuchadrezzar (or Nebuchadnezzar), 604-561, who destroyed Jerusalem and carried the Jews into captivity, built many temples and places in Babylon, his capital. These monuments were in crude brick as the plain of the Euphrates has no supply of stone; in the process of decay they have left only enormous masses of earth and debris. And yet it has been possible on the site of Babylon to recover some inscriptions and to restore the plan of the city. The Greek Herodotus who had visited Babylon in the fifth century B.C., describes it in detail. The city was surrounded by a square wall cut by the Euphrates; it covered about 185 square miles, or seven times the extent of Paris. This immense space was not filled with houses; much of it was occupied with fields to be cultivated for the maintenance of the people in the event of a siege. Babylon was less a city than a fortified camp. The walls equipped with towers and pierced by a hundred gates of brass were so thick that a chariot might be driven on them. All around the wall was a large, deep ditch full of water, with its sides lined with brick. The houses of the city were constructed of three or four stories. The streets intersected at right angles. The bridge and docks of the Euphrates excited admiration; the fortified palace also, and the hanging gardens, one of the seven wonders of the world. These gardens were terraces planted with trees, supported by pillars and rows of arches.

=Tower of Babylon.=--Hard by the city Nebuchadnezzar had aimed to rebuild the town of Babel. "For the admiration of men," he says in an inscription: "I rebuilt and renovated the wonder of Borsippa, the temple of the seven spheres of the world. I laid the foundations and built it according to its ancient plan." This temple, in the form of a square, comprised seven square towers raised one above another, each tower being dedicated to one of the seven planets and painted with the color attributed by religion to this planet. They were, beginning with the lowest: Saturn (black), Venus (white), Jupiter (purple), Mercury (blue), Mars (vermilion), the moon (silver), the sun (gold). The highest tower contained a chapel with a table of gold and magnificent couch whereon a priestess kept watch continually.

CUSTOMS AND RELIGION

=Customs.=--We know almost nothing of these peoples apart from the testimony of their monuments, and nearly all of these refer to the achievements of their kings. The Assyrians are always represented at war, hunting, or in the performance of ceremonies; their women never appear on the bas-reliefs; they were confined in a harem and never went into public life. The Chaldeans on the contrary, were a race of laborers and merchants, but of their life we know nothing. Herodotus relates that once a year in their towns they assembled all the girls to give them in marriage; they sold the prettiest, and the profits of the sale of these became a dower for the marriage of the plainest. "According to my view," he adds, "this is the wisest of all their laws."

=Religion.=--The religion of the Assyrians and Chaldeans was the same, for the former had adopted that of the latter. It is very obscure to us, since it originated, like that of the Chaldean people, in a confusion of religions very differently mingled. The Turanians, like the present yellow race of Siberia, imagined the world full of demons (plague, fever, phantoms, vampires), engaged in prowling around men to do them harm; sorcerers were invoked to banish these demons by magical formulas. The Cushites adored a pair of gods, the male deity of force and the female of matter. The Chaldean priests, united in a powerful guild, confused the two religions into a single one.

=The Gods.=--The supreme god at Babylon is Ilou; in Assyria, Assur. No temple was raised to him. Three gods proceed from him: Anou, the "lord of darkness," under the figure of a man with the head of a fish and the tail of an eagle; Bel, the "sovereign of spirits," represented as a king on the throne; Nouah, the "master of the visible world," under the form of a genius with four extended wings. Each has a feminine counterpart who symbolizes fruitfulness. Below these gods are the Sun, the Moon, and the five planets, for in the transparent atmosphere of Chaldea the stars shine with a brilliancy which is strange to us; they gleam like deities. To these the Chaldeans raised temples, veritable observatories in which men who adored them could follow all their motions.

=Astrology.=--The priests believed that these stars, being powerful deities, had determining influence on the lives of men. Every man comes into the world under the influence of a planet and this moment decides his destiny; one may foretell one's fortune if the star under which one is born is known. This is the origin of the horoscope. What occurs in heaven is indicative of what will come to

pass on earth; a comet, for example, announces a revolution. By observing the heavens the Chaldean priests believed they could predict events. This is the origin of Astrology.

=Sorcery.=--The Chaldeans had also magical words; these were uttered to banish spirits or to cause their appearance. This custom, a relic of the Turanian religion, is the origin of sorcery. From Chaldea astrology and sorcery were diffused over the Roman empire, and later over all Europe. In the formulas of sorcery of the sixteenth century corrupted Assyrian words may still be detected.[20]

=Sciences.=--On the other hand it is in Chaldea that we have the beginning of astronomy. From this land have come down to us the zodiac, the week of seven days in honor of the seven planets; the division of the year into twelve months, of the day into twenty-four hours, of the hour into sixty minutes, of the minute into sixty seconds. Here originated, too, the system of weights and measures reckoned on the unit of length, a system adopted by all the ancient peoples.

ARTS

=Architecture.=--We do not have direct knowledge of the art of the Chaldeans, since their monuments have fallen to ruin. But the Assyrian artists whose works we possess imitated those of Chaldea, and so we may form a judgment at the same time of the two countries. The Assyrians like the Chaldeans built with crude, sun-dried brick, but they faced the exterior of the wall with stone.

=Palaces.=--They constructed their palaces[21] on artificial mounds, making these low and flat like great terraces. The crude brick was not adapted to broad and high arches. Halls must therefore be straight and low, but in compensation they were very long. An Assyrian palace, then, resembled a succession of galleries; the roofs were flat terraces provided with battlements. At the gate stood gigantic winged bulls. Within, the walls were covered now with panelling in precious woods, now with enamelled bricks, now with plates of sculptural alabaster. Sometimes the chambers were painted, and even richly encrusted marbles were used.

=Sculpture.=--The sculpture of the Assyrian palaces is especially admirable. Statues, truly, are rare and coarse; sculptors preferred to execute bas-reliefs similar to pictures on great slabs of alabaster. They represented scenes which were often very complicated--battles, chases, sieges of towns, ceremonies in which the king appeared with a great retinue. Every detail is scrupulously done; one sees the files of servants in charge of the feast of the king, the troops of workmen who built his palace, the gardens, the fields, the ponds, the fish in the water, the birds perched over their nests or flitting from tree to tree. Persons are exhibited in profile, doubtless because the artist could not depict the face; but they possess dignity and life. Animals often appeared, especially in hunting scenes; they are ordinarily made with a startling fidelity. The Assyrians observed nature and faithfully reproduced it; hence the merit of their art.

The Greeks themselves learned in this school, by imitating the Assyrian bas-reliefs. They have excelled them, but no people, not even the Greeks, has better known how to represent animals.

[21] The temples were pyramidal, of stones or terraces similar to the tower of Borsippa.

CHAPTER V

THE ARYANS OF INDIA

THE ARYANS

=Aryan Languages.=--The races which in our day inhabit Europe--Greeks and Italians to the south, Slavs in Russia, Teutons in Germany, Celts in Ireland--speak very different languages. When, however, one studies these languages closely, it is perceived that all possess a stock of common words, or at least certain roots. The same roots occur in Sanscrit, the ancient language of the Hindoos, and also in Zend, the ancient tongue of the Persians. Thus,

Father--pere (French), pitar (Sanscrit), pater (Greek and Latin). It is the same word pronounced in various ways. From this (and other such examples) it has been concluded that all--Hindoos, Persians, Greeks, Latins, Celts, Germans, Slavs--once spoke the same language, and consequently were one people.

=The Aryan People.=--These peoples then called themselves Aryans and lived to the north-west of India, either in the mountains of Pamir, or in the steppes of Turkestan or Russia; from this centre they dispersed in all directions. The majority of the people--Greeks, Latins, Germans, Slavs--forgot their origin; but the sacred books of the Hindoos and the Persians preserve the tradition. Effort has been made[22] to reconstruct the life of our Aryan ancestors in their mountain home before the dispersion. It was a race of shepherds; they did not till the soil, but subsisted from their herds of cattle and sheep, though they already had houses and even villages.

It was a fighting race; they knew the lance, the javelin, and shield. Government was patriarchal; a man had but one wife; as head of the family he was for his wife, his children, and his servants at once priest, judge, and king. In all the countries settled by the Aryans they have followed this type of life--patriarchal, martial, and pastoral.

PRIMITIVE RELIGION OF THE HINDOOS

=The Aryans on the Indus.=--About 2,000 years before our era some Aryan tribes traversed the passes of the Hindu-Kush and swarmed into India. They found the fertile plains of the Indus inhabited by a people of dark skin, with flat heads, industrious and wealthy; they called these aborigines Dasyous (the enemy). They made war on them for centuries and ended by exterminating or subjecting them; they then gradually took possession of all the Indus valley (the region of the five rivers).[23] They then called themselves Hindoos.

=The Vedas.=--These people were accustomed in their ceremonies to chant hymns (vedas) in honor of their gods. These chants constituted a vast compilation which has been preserved to the present time. They were collected, perhaps, about the fourteenth century B.C. when the Aryans had not yet passed the Indus. The hymns present to us the oldest religion of the Hindoos.

=The Gods.=--The Hindoo calls his gods devas (the resplendent). Everything that shines is a divinity--the heavens, the dawn, the clouds, the stars--but especially the sun (Indra) and fire (Agni).

=Indra.=--The sun, Indra, the mighty one, "king of the world and master of creatures," bright and warm, traverses the heavens on a car drawn by azure steeds; he it is who hurls the thunderbolt, sends the rain, and banishes the clouds. India is a country of violent tempests; the Hindoo struck with this phenomenon explained it in his own fashion. He conceived the black cloud as an envelope in which were contained the waters of heaven; these beneficent waters he called the gleaming cows of Indra. When the storm is gathering, an evil genius, Vritra, a three-headed serpent, has driven away the cows and enclosed them in the black cavern whence their bellowings are heard (the far-away rumblings of thunder). Indra applies himself to the task of finding them; he strikes the cavern with his club, the strokes of which are heard (the thunderbolt), and the forked tongue of the serpent (the lightning) darts forth. At last the serpent is vanquished, the cave is opened, the waters released fall on the earth, Indra the victor appears in glory.

=Agni.=--Fire (Agni, the tireless) is regarded as another form of the sun. The Hindoo, who produces it by rapidly rubbing two pieces of wood together, imagines that the fire comes from the wood and that the rain has placed it there. He conceives it then as the fire of heaven descended to earth; in fact, when one places it on the hearth, it springs up as if it would ascend toward heaven. Agni dissipates darkness, warms mankind, and cooks his food; it is the benefactor and the protector of the house. It is also "the internal fire," the soul of the world; even the ancestor of the human race is the "son of lightning." Thus, heat and light, sources of all life, are the deities of the Hindoo.

=Worship.=--To adore his gods he strives to reproduce what he sees in heaven. He ignites a terrestrial fire by rubbing sticks, he nourishes it by depositing on the hearth, butter, milk, and soma, a fermented drink. To delight the gods he makes offerings to them of fruits and cakes; he even sacrifices to them cattle, rams and horses; he then invokes them, chanting hymns to their praise. "When thou art bidden by us to quaff the soma, come with thy sombre steeds, thou deity whose darts are stones. Our celebrant is

seated according to prescription, the sacred green is spread, in the morning stones have been gathered together. Take thy seat on the holy sward; taste, O hero, our offering to thee. Delight thyself in our libations and our chants, vanquisher of Vritra, thou who art honored in these ceremonies of ours, O Indra."

The Hindoo thinks that the gods, felicitated by his offerings and homage, will in their turn make him happy. He says naively, "Give sacrifice to the gods for their profit, and they will requite you. Just as men traffic by the discussion of prices, let us exchange force and vigor, O Indra. Give to me and I will give to you; bring to me and I will bring to you."

=Ancestor Worship.=--At the same time the Hindoo adores his ancestors who have become gods, and perhaps this cult is the oldest of all. It is the basis of the family. The father who has transmitted the "fire of life" to his children makes offering every day at his hearth-fire, which must never be extinguished, the sacrifice to gods and ancestors, and utters the prayers. Here it is seen that among Hindoos, as among other Aryans, the father is at once a priest and a sovereign.

THE BRAHMANIC SOCIETY

=The Hindoos on the Ganges.=--The Hindoos passing beyond the region of the Indus, between the fourteenth and tenth century B.C. conquered all the immense plains of the Ganges. Once settled in this fertile country, under a burning climate, in the midst of a people of slaves, they gradually changed customs and religion. And so the Brahmanic society was established. Many works in Sanscrit are preserved from this time, which, with the Vedas, form the sacred literature of the Hindoos. The principal are the great epic poems, the Mahabarata, which has more than 200,000 verses; the Ramayana with 50,000, and the laws of Manou, the sacred code of India.

=Caste.=--In this new society there were no longer, as in the time of the Vedas, poets who chanted hymns to the gods. The men who know the prayers and the ceremonies are become theologians by profession; the people revere and obey them. The following is their conception of the structure of society: the supreme god, Brahma, has produced four kinds of men to each of whom he has assigned a mission. From his mouth he drew the Brahmans, who are, of course, the theologians; their mission is to study, to teach the hymns, to perform the sacrifices. The Kchatrias have come from his arms; these are the warriors who are charged with the protection of the people. The Vaicyas proceed from the thigh; they must raise cattle, till the earth, loan money at interest, and engage in commerce. The Soudras issue from his foot; their only mission is to serve all the others.

There were already in the Aryan people theologians, warriors, artisans, and below them aborigines reduced to slavery. These were classes which one could enter and from which one could withdraw. But the Brahmans determined that every man should be attached to the condition in which he was born, he and his descendants for all time. The son of a workman could never become a warrior, nor the son of a warrior a theologian. Thus each is chained to his own state. Society is divided into four hereditary and closed castes.

=The Unclean.=--Whoever is not included in one of the four castes is unclean, excluded from society and religion. The Brahmans reckoned forty-four grades of outcasts; the last and the lowest is that of the pariahs; their very name is an insult. The outcasts may not practise any honorable trade nor approach other men. They may possess only dogs and asses, for these are unclean beasts. "They must have for their clothing the garments of the dead; for plates, broken pots; ornaments of iron; they must be ceaselessly on the move from one place to another."

=The Brahmans.=--In the organization of society the Brahmans were assigned the first place. "Men are the first among intelligent beings; the Brahmans are the first among men. They are higher than warriors, than kings, even. As between a Brahman of ten years of age and a Kchatria of one hundred years, the Brahman is to be regarded as the father." These are not priests as in Egypt and Chaldea, but only men who know religion, and pass their time in reading and meditating on the sacred books; they live from presents made to them by other men. To this day they are the dominating class of India. As they marry only among themselves, better than the other Hindoos they have preserved the Aryan type and have a clearer resemblance to Europeans.

=The New Religion of Brahma.=--The Brahmans did not discard the ancient gods of the Vedas, they continued to adore them. But by sheer ingenuity they invented a new god. When prayers are addressed to the gods, the deities are made to comply with the demands made on them, as if they thought that prayer was more powerful than the gods. And so prayer (Brahma) has become the highest of all deities. He is invoked with awe:[24] "O god, I behold in thy body all the gods and the multitudes of living beings. I am powerless to regard thee in thine entirety, for thou shinest like the fire and the sun in thine immensity. Thou art the Invisible, thou art the supreme Intelligence, thou art the sovereign treasure of the universe, without beginning, middle, or end; equipped with infinite

might. Thine arms are without limit, thine eyes are like the moon and the sun, thy mouth hath the brightness of the sacred fire. With thyself alone thou fillest all the space between heaven and earth, and thou permeatest all the universe." Brahma is not only supreme god; he is the soul of the universe. All beings are born from Brahma, all issue naturally from him, not as a product comes from the hands of an artisan, but "as the tree from the seed, as the web from the spider." Brahma is not a deity who has created the world; he is the very substance of the world.

=Transmigration of Souls.=--There is, then, a soul, a part of the soul of Brahma, in every being, in gods, in men, in animals, in the very plants and stones. But these souls pass from one body into another; this is the transmigration of souls. When a man dies, his soul is tested; if it is good, it passes into the heaven of Indra there to enjoy felicity; if it is bad, it falls into one of the twenty-eight hells, where it is devoured by ravens, compelled to swallow burning cakes, and is tormented by demons. But souls do not remain forever in heaven or in the hells; they part from these to begin a new life in another body. The good soul rises, entering the body of a saint, perhaps that of a god; the evil soul descends, taking its abode in some impure animal--in a dog, an ass, even in a plant. In this new state it may rise or fall. And this journey from one body to another continues until the soul by degrees comes to the highest sphere. From lowest to highest in the scale, say the Brahmans, twenty-four millions of years elapse. At last perfect, the soul returns to the level of Brahma from which it descends and is absorbed into it.

=Character of this Religion.=--The religion of the Aryans, simple and happy, was that of a young and vigorous people. This is complicated and barren; it takes shape among men who are not engaged in practical life; it is enervated by the heat and vexatious of life.

=Rites.=--The practice of the religion is much more complicated. Hymns and sacrifices are still offered to the gods, but the Brahmans have gradually invented thousands of minute customs so that one's life is completely engaged with them. For all the ceremonies of the religious life there are prayers, offerings, vows, libations, ablutions. Some of the religious requirements attach themselves to dress, ornaments, etiquette, drinking, eating, mode of walking, of lying down, of sleeping, of dressing, of undressing, of bathing. It is ordered: "That a Brahman shall not step over a rope to which a calf is attached; that he shall not run when it rains; that he shall not drink water in the hollow of his hand; that he shall not scratch his head with both his hands. The man who breaks clods of earth, who cuts grass with his nails or who bites his nails is, like the outcast, speedily hurried to his doom." An animal must not be killed, for a human soul may perhaps be dwelling in the body; one must not eat it on penalty of being devoured in another life by the animals which one has eaten.

All these rites have a magical virtue; he who observes them all is a saint; he who neglects any of them is impious and destined to pass into the body of an animal.

=Purity.=--The principal duty is keeping one's self pure; for every stain is a sin and opens one to the attack of evil spirits. But the Brahmans are very scrupulous concerning purity: men outside of the castes, many animals, the soil, even the utensils which one uses are so many impure things; whoever touches these is polluted and must at once purify himself. Life is consumed in purifications.

=Penances.=--For every defect in the rites, a penance is necessary, often a terrible one. He who involuntarily kills a cow must clothe himself in its skin, and for three months, day and night, follow and tend a herd of cows. Whoever has drunk of arrack[25] must swallow a boiling liquid which burns the internal organs until death results.

=The Monks.=--To escape so many dangers and maintain purity, it is better to leave the world. Often a Brahman when he has attained to a considerable age withdraws to the desert, fasts, watches, refrains from speech, exposes himself naked to the rain, holds himself erect between four fires under the burning sun. After some years, the solitary becomes "penitent"; then his only subsistence is from almsgiving; for whole days he lifts an arm in the air uttering not a word, holding his breath; or perchance, he gashes himself with razor-blades; or he may even keep his thumbs closed until the nails pierce the hands. By these mortifications he destroys passion, releases himself from this life, and by contemplation rises to Brahma. And yet, this way of salvation is open only to the Brahman; and even he has the right to withdraw to the desert only in old age, after having studied the Vedas all his life, practised all the rites, and established a family.

BUDDHISM

=Buddha.=--Millions of men who were not Brahmans, suffered by this life of minutiae and anguish. A man then appeared who brought a doctrine of deliverance. He was not a Brahman, but of the caste of the Kchatrias, son of a king of the north. To the age of

twenty-nine he had lived in the palace of his father. One day he met an old man with bald head, of wrinkled features, and trembling limbs; a second time he met an incurable invalid, covered with ulcers, without a home; again he fell in with a decaying corpse devoured by worms. And so, thought he, youth, health, and life are nothing for they offer no resistance to old age, to sickness, and to death. He had compassion on men and sought a remedy. Then he met a religious mendicant with grave and dignified air; following his example he decided to renounce the world. These four meetings had determined his calling.

Buddha fled to the desert, lived seven years in penitence, undergoing hunger, thirst, and rain. These mortifications gave him no repose. He ate, became strong, and found the truth. Then he reentered the world to preach it; he made disciples in crowds who called him Buddha (the scholar); and when he died after forty-five years of preaching, Buddhism was established.

=Nirvana.=--To live is to be unhappy, taught Buddha. Every man suffers because he desires the goods of this world, youth, health, life, and cannot keep them. All life is a suffering; all suffering is born of desire. To suppress suffering, it is necessary to root out desire; to destroy it one must cease from wishing to live, "emancipate one's self from the thirst of being." The wise man is he who casts aside everything that attaches to this life and makes it unhappy. One must cease successively from feeling, wishing, thinking. Then, freed from passion, volition, even from reflection, he no longer suffers, and can, after his death, come to the supreme good, which consists in being delivered from all life and from all suffering. The aim of the wise man is the annihilation of personality: the Buddhists call it Nirvana.

=Charity.=--The Brahmans also considered life as a place of suffering and annihilation as felicity. Buddha came not with a new doctrine, but with new sentiments.

The religion of the Brahmans was egoistic. Buddha had compassion on men, he loved them, and preached love to his disciples. It was just this word of sympathy of which despairing souls were in need. He bade to love even those who do us ill. Purna, one of his disciples, went forth to preach to the barbarians. Buddha said to him to try him, "There are cruel, passionate, furious men; if they address angry words to you, what would you think?" "If they addressed angry words to me," said Purna, "I should think these are good men, these are gentle men, these men who attack me with wicked words but who strike me neither with the hand nor with stones." "But if they strike you, what would you think?" "I should think that those were good men who did not strike me with their staves or with their swords." "But if they did strike you with staff and sword, what would you think then?" "That those are good men who strike me with staff and sword, but do not take my life." "But if they should take your life?" "I should think them good men who delivered me with so little pain from this body filled as it is with pollution." "Well, well, Purna! You may dwell in the country of the barbarians. Go, proceed on the way to complete Nirvana and bring others to the same goal."

=Fraternity.=--The Brahmans, proud of their caste, assert that they are purer than the others. Buddha loves all men equally, he calls all to salvation even the pariahs, even the barbarians--all he declares are equal. "The Brahman," said he, "just like the pariah, is born of woman; why should he be noble and the other vile?" He receives as disciples street-sweepers, beggars, cripples, girls who sleep on dung-hills, even murderers and thieves; he fears no contamination in touching them. He preaches to them in the street in language simple with parables.

=Tolerance.=--The Brahmans passed their lives in the practice of minute rites, regarding as criminal whoever did not observe them. Buddha demanded neither rites nor exertions. To secure salvation it was enough to be charitable, chaste, and beneficent. "Benevolence," says he, "is the first of virtues. Doing a little good avails more than the fulfilment of the most arduous religious tasks. The perfect man is nothing unless he diffuses himself in benefits over creatures, unless he comforts the afflicted. My doctrine is a doctrine of mercy; this is why the fortunate in the world find it difficult."

=Later History of Buddhism.=--Thus was established about 500 years before Christ a religion of an entirely new sort. It is a religion without a god and without rites; it ordains only that one shall love his neighbor and become better; annihilation is offered as supreme recompense. But, for the first time in the history of the world, it preaches self-renunciation, the love of others, equality of mankind, charity and tolerance. The Brahmans made bitter war upon it and extirpated it in India. Missionaries carried it to the barbarians in Ceylon, in Indo-China, Thibet, China, and Japan. It is today the religion of about 500,000,000[26] people.

=Changes in Buddhism.=--During these twenty centuries Buddhism has undergone change. Buddha had himself formed communities of monks. Those who entered these renounced their family, took the vow of poverty and chastity; they had to wear filthy rags and beg their living. These religious rapidly multiplied; they founded convents in all Eastern Asia, gathered in councils to fix the doctrine, proclaimed dogmas and rules. As they became powerful they, like the Brahmans, came to esteem themselves as above the rest of the faithful. "The layman," they said, "plight to support the religious and consider himself much honored that the

holy man accepts his offering. It is more commendable to feed one religious than many thousands of laymen." In Thibet the religious, men and women together, constitute a fifth of the entire population, and their head, the Grand Lama, is venerated as an incarnation of God.

At the same time that they transformed themselves into masters, the Buddhist religious constructed a complicated theology, full of fantastic figures. They say there is an infinite number of worlds. If one surrounded with a wall a space capable of holding 100,000 times ten millions of those worlds, if this wall were raised to heaven, and if the whole space were filled with grains of mustard, the number of the grains would not even then equal one-half the number of worlds which occupy but one division of heaven. All these worlds are full of creatures, gods, men, beasts, demons, who are born and who die. The universe itself is annihilated and another takes its place. The duration of each universe is called _kalpa_; and this is the way we obtain an impression of a kalpa: if there were a rock twelve miles in height, breadth, and length, and if once in a century it were only touched with a piece of the finest linen, this rock would be worn and reduced to the size of a kernel of mango before a quarter of a kalpa had elapsed.

=Buddha Transformed into a God.=--It no longer satisfied the Buddhists to honor their founder as a perfect man; they made him a god, erecting idols to him, and offering him worship. They adored also the saints, his disciples; pyramids and shrines were built to preserve their bones, their teeth, their cloaks. From every quarter the faithful came to venerate the impression of the foot of Buddha.

=Mechanical Prayer.=--Modern Buddhists regard prayer as a magical formula which acts of itself. They spend the day reciting prayers as they walk or eat, often in a language which they do not understand. They have invented prayer-machines; these are revolving cylinders and around these are pasted papers on which the prayer is written; every turn of the cylinder counts for the utterance of the prayer as many times as it is written on the papers.

=Amelioration of Manners.=--And yet Buddhism remains a religion of peace and charity. Wherever it reigns, kings refrain from war, and even from the chase; they establish hospitals, caravansaries, even asylums for animals. Strangers, even Christian missionaries, are hospitably received; they permit the women to go out, and to walk without veiling themselves; they neither fight nor quarrel. At Bangkok, a city of 400,000 souls, hardly more than one murder a year is known.

Buddhism has enfeebled the intelligence and sweetened the character.[27]

FOOTNOTES:

[22] The process is as follows: when a word (or rather a root) is found in several Aryan languages at once, it is admitted that this was in use before the dispersion occurred, and therefore the people knew the object designated by the word.

[27] India is for us the country of the Vedas, the Brahmans, and Buddha. We know the religion of the Hindoos, but of their political history we are ignorant.

CHAPTER VI

THE PERSIANS

THE RELIGION OF ZOROASTER

=Iran.=--Between the Tigris and the Indus, the Caspian Sea and the Persian Gulf rises the land of Iran, five times as great as France,[28] but partly sterile. It is composed of deserts of burning sand and of icy plateaux cut by deep and wooded valleys. Mountains surround it preventing the escape of the rivers which must lose themselves in the sands or in the salt lakes. The climate is harsh, very uneven, torrid in summer, frigid in winter; in certain quarters one passes from 104 deg. above zero to 40 deg. below, from the cold of Siberia to the heat of Senegal. Violent winds blow which "cut like a sword." But in the valleys along the rivers the soil is fertile. Here the peach and cherry are indigenous; the country is a land of fruits and pastures.

=The Iranians.=--Aryan tribes inhabited Iran. Like all the Aryans, they were a race of shepherds, but well armed and warlike. The Iranians fought on horseback, drew the bow, and, to protect themselves from the biting wind of their country, wore garments of skin sewed on the body.

=Zoroaster.=--Like the ancient Aryans, they first adored the forces of nature, especially the sun (Mithra). Between the tenth and seventh[29] centuries before our era their religion was reformed by a sage, Zarathustra (Zoroaster). We know nothing certainly about him except his name.

=The Zend-Avesta.=--No writing from the hand of Zoroaster is preserved to us; but his doctrine, reduced to writing long after his death, is conserved in the Zend-Avesta (law and reform), the sacred books of the Persians. It was a compilation written in an ancient language (the Zend) which the faithful themselves no longer understood. It was divided into twenty-one books, inscribed on 12,000 cow skins, bound by golden cords. The Mohammedans destroyed it when they invaded Persia. But some Persian families, faithful to the teaching of Zoroaster, fled into India. Their posterity, whom we call Parsees, have there maintained the old religion. An entire book of the Zend-Avesta and fragments of two others have been found among them.

=Ormuzd and Ahriman.=--The Zend-Avesta is the sacred book of the religion of Zoroaster. According to these writings Ahura Mazda (Ormuzd), "the omniscient sovereign," created the world. He is addressed in prayer in the following language: "I invoke and celebrate the creator, Ahura Mazda, luminous, glorious, most intelligent and beautiful, eminent in purity, who possessest the good knowledge, source of joy, who hast treated us, hast fashioned us, and hast nourished us." Since he is perfect in his goodness, he can create only that which is good. Everything bad in the world has been created by an evil deity, Angra Manyou, (Ahriman), the "spirit of anguish."

=Angels and Demons.=--Over against Ormuzd, the god and the creator, is Ahriman, wicked and destructive. Each has in his service a legion of spirits. The soldiers of Ormuzd are the good angels (yazatas), those of Ahriman the evil demons (devs). The angels dwell in the East in the light of the rising sun; the demons in the West in the shadows of the darkness. The two armies wage incessant warfare; the world is their battleground, for both troops are omnipresent. Ormuzd and his angels seek to benefit men, to make them good and happy; Ahriman and his demons gnaw around them to destroy them, to make them unhappy and wicked.

=Creatures of Ormuzd and Ahriman.=--Everything good on the earth is the work of Ormuzd and works for good; the sun and fire that dispel the night, the stars, fermented drinks that seem to be liquid fire, the water that satisfies the thirst of man, the cultivated fields that feed him, the trees that shade him, domestic animals--especially the dog,[30] the birds (because they live in the air), among all these the cock since he announces the day. On the other hand everything that is baneful comes from Ahriman and tends to evil: the night, drought, cold, the desert, poisonous plants, thorns, beasts of prey, serpents, parasites (mosquitoes, fleas, bugs) and animals that live in dark holes--lizards, scorpions, toads, rats, ants. Likewise in the moral world life, purity, truth, work are good things and come from Ormuzd; death, filth, falsehood, idleness are bad, and issue from Ahriman.

=Worship.=--From these notions proceed worship and morality. Man ought to adore the good god[31] and fight for him. According to Herodotus, "The Persians are not accustomed to erect statues, temples, or altars to their gods; they esteem those who do this as lacking in sense for they do not believe, as the Greeks do, that the gods have human forms."[32] Ormuzd manifests himself only under the form of fire or the sun. This is why the Persians perform their worship in the open air on the mountains, before a lighted fire. To worship Ormuzd they sing hymns to his praise and sacrifice animals in his honor.

=Morality.=--Man fights for Ormuzd in aiding his efforts and in overcoming Ahriman's. He wars against darkness in supplying the fire with dry wood and perfumes; against the desert in tilling the soil and in building houses; against the animals of Ahriman in killing serpents, lizards, parasites, and beasts of prey. He battles against impurity in keeping himself clean, in banishing from himself everything that is dead, especially the nails and hair, for "where hairs and clipped nails are, demons and unclean animals assemble." He fights against falsehood by always being truthful. "The Persians," says Herodotus,[33] "consider nothing so shameful as lying, and after falsehood nothing so shameful as contracting debts, for he who has debts necessarily lies." He wars against death by marrying and having many children. "Terrible," says the Zend-Avesta, "are the houses void of posterity."

=Funerals.=--As soon as a man is dead his body belongs to the evil spirit. It is necessary, then, to remove it from the house. But it ought not to be burned, for in this way the fire would be polluted; it should not be buried, for so is the soil defiled; nor is it to be drowned, and thus contaminate the water. These dispositions of the corpse would bring permanent pollution. The Persians resorted to a different method. The body with face toward the sun was exposed in an elevated place and left uncovered, securely fixed with stones; the bearers then withdrew to escape the demons, for they assemble "in the places of sepulture, where reside sickness,

fever, filth, cold, and gray hairs." Dogs and birds, pure animals, then come to purify the body by devouring it.

=Destiny of the Soul.=--The soul of the dead separates itself from the body. In the third night after death it is conducted over the "Bridge of Assembling" (Schinvat) which leads to the paradise above the gulf of inferno. There Ormuzd questions it on its past life. If it has practised the good, the pure spirits and the spirits of dogs support it and aid it in crossing the bridge and give it entrance into the abode of the blest; the demons flee, for they cannot bear the odor of virtuous spirits. The soul of the wicked, on the other hand, comes to the dread bridge, and reeling, with no one to support it, is dragged by demons to hell, is seized by the evil spirit and chained in the abyss of darkness.

=Character of Mazdeism.=--This religion originated in a country of violent contrasts, luxuriant valleys side by side with barren steppes, cool oases with burning deserts, cultivated fields and stretches of sand, where the forces of nature seem engaged in an eternal warfare. This combat which the Iranian saw around him he assumed to be the law of the universe. Thus a religion of great purity was developed, which urged man to work and to virtue; but at the same time issued a belief in the devil and in demons which was to propagate itself in the west and torment all the peoples of Europe.

THE PERSIAN EMPIRE

=The Medes.=--Many were the tribes dwelling in Iran; two of these have become noted in history--the Medes and the Persians. The Medes at the west, nearer the Assyrians, destroyed Nineveh and its empire (625). But soon they softened their manners, taking the flowing robes, the indolent life, the superstitious religion of the degenerate Assyrians. They at last were confused with them.

=The Persians.=--The Persians to the east preserved their manners, their religion, and their vigor. "For twenty years," says Herodotus, "the Persians teach their children but three things--to mount a horse, to draw the bow, and to tell the truth."

=Cyrus.=--About 550 Cyrus, their chief, overthrew the king of the Medes, reunited all the peoples of Iran, and then conquered Lydia, Babylon, and all Asia Minor. Herodotus recounts in detail a legend which became attached to this prince. Cyrus himself in an inscription says of himself, "I am Cyrus, king of the legions, great king, mighty king, king of Babylon, king of Sumir and Akkad, king of the four regions, son of Cambyses, great king of Susiana, grand-son of Cyrus, king of Susiana."

=The Inscription of Behistun.=--The eldest son of Cyrus, Cambyses, put to death his brother Smerdis and conquered Egypt. What occurred afterward is known to us from an inscription. Today one may see on the frontier of Persia, in the midst of a plain, an enormous rock, cut perpendicularly, about 1,500 feet high, the rock of Behistun. A bas-relief carved on the rock represents a crowned king, with left hand on a bow; he tramples on one captive while nine other prisoners are presented before him in chains. An inscription in three languages relates the life of the king: "Darius the king declares, This is what I did before I became king. Cambyses, son of Cyrus, of our race, reigned here before me. This Cambyses had a brother Smerdis, of the same father and the same mother. One day Cambyses killed Smerdis. When Cambyses had killed Smerdis the people were ignorant that Smerdis was dead. After this Cambyses made an expedition to Egypt and while he was there the people became rebellious; falsehood was then rife in the country, in Persia, in Media and the other provinces. There was at that time a magus named Gaumata; he deceived the people by saying that he was Smerdis, the son of Cyrus. Then the whole people rose in revolt, forsook Cambyses and went over to the pretender. After this Cambyses died from a wound inflicted by himself.

"After Gaumata had drawn away Persia, Media, and the other countries from Cambyses, he followed out his purpose: he became king. The people feared him on account of his cruelty: he would have killed the people so that no one might learn that he was not Smerdis, the son of Cyrus. Darius the king declares there was not a man in all Persia or in Media who dared to snatch the crown from this Gaumata, the magus. Then I presented myself, I prayed Ormuzd. Ormuzd accorded me his protection.... Accompanied by faithful men I killed this Gaumata and his principal accomplices. By the will of Ormuzd I became king. The empire which had been stolen from our race I restored to it. The altars that Gaumata, the magus, had thrown down I rebuilt to the deliverance of the people; I received the chants and the sacred ceremonials." Having overturned the usurper, Darius had to make war on many of the revolting princes, "I have," said he, "won nineteen battles and overcome nine kings."

=The Persian Empire.=--Darius then subjected the peoples in revolt and reestablished the empire of the Persians. He enlarged it also by conquering Thrace and a province of India. This empire reunited all the peoples of the Orient: Medes and Persians, Assyrians, Chaldeans, Jews, Phoenicians, Syrians, Lydians, Egyptians, Indians; it covered all the lands from the Danube on the west to the Indus on the east, from the Caspian Sea on the north to the cataracts of the Nile on the south. It was the greatest empire up to this time. One tribe of mountaineers, the last to come, thus received the heritage of all the empires of Asia.

=The Satrapies.=--Oriental kings seldom concerned themselves with their subjects more than to draw money from them, levy soldiers, and collect presents; they never interfered in their local affairs. Darius, like the rest, left each of the peoples of his empire to administer itself according to its own taste, to keep its language, its religion, its laws, often its ancient princes. But he took care to regulate the taxes which his subjects paid him. He divided all the empire into twenty[34] districts called satrapies. There were in the same satrapy peoples who differed much in language, customs, and beliefs; but each satrapy was to pay a fixed annual tribute, partly in gold and silver, partly in natural products (wheat, horses, ivory). The satrap, or governor, had the tribute collected and sent it to the king.

=Revenues of the Empire.=--The total revenue of the king amounted to sixteen millions of dollars and this money was paid by weight. This sum was in addition to the tributes in kind. These sixteen millions of dollars, if we estimate them by the value of the metals at this time, would be equivalent to one hundred and twenty millions in our day. With this sum the king supported his satraps, his army, his domestic servants and an extravagant court; there still remained to him every year enormous ingots of metal which accumulated in his treasuries. The king of Persia, like all the Orientals, exercised his vanity in possessing an immense treasure.

=The Great King.=--No king had ever been so powerful and rich. The Greeks called the Persian king The Great King. Like all the monarchs of the East, the king had absolute sway over all his subjects, over the Persians as well as over tributary peoples. From Herodotus one can see how Cambyses treated the great lords at his court. "What do the Persians think of me?" said he one day to Prexaspes, whose son was his cupbearer. "Master, they load you with praises, but they believe that you have a little too strong desire for wine." "Learn," said Cambyses in anger, "whether the Persians speak the truth. If I strike in the middle of the heart of your son who is standing in the vestibule, that will show that the Persians do not know what they say." He drew his bow and struck the son of Prexaspes. The youth fell; Cambyses had the body opened to see where the shot had taken effect The arrow was found in the middle of the heart. The prince, full of joy said in derision to the father of the young man, "You see that it is the Persians who are out of their senses; tell me if you have seen anybody strike the mark with so great accuracy." "Master," replied Prexaspes, "I do not believe that even a god could shoot so surely."[35]

=Services Rendered by the Persians.=--The peoples of Asia have always paid tribute to conquerors and given allegiance to despots. The Persians, at least, rendered them a great service: in subjecting all these peoples to one master they prevented them from fighting among themselves. Under their domination we do not see a ceaseless burning of cities, devastation of fields, massacre or wholesale enslavement of inhabitants. It was a period of peace.

=Susa and Persepolis.=--The kings of the Medes and Persians, following the example of the lords of Assyria, had palaces built for them. Those best known to us are the palaces at Susa and Persepolis. The ruins of Susa have been excavated by a French engineer,[36] who has discovered sculptures, capitals, and friezes in enameled bricks which give evidence of an advanced stage of art. The palace of Persepolis has left ruins of considerable mass. The rock of the hill had been fashioned into an enormous platform on which the palace was built. The approach to it was by a gently rising staircase so broad that ten horsemen could ascend riding side by side.

=Persian Architecture.=--Persian architects had copied the palaces of the Assyrians. At Persepolis and Susa, as in Assyria, are flat-roofed edifices with terraces, gates guarded by monsters carved in stone, bas-reliefs and enameled bricks, representing hunting-scenes and ceremonies. At three points, however, the Persians improved on their models:

(1) They used marble instead of brick; (2) they made in the halls painted floors of wood; (3) they erected eight columns in the form of trunks of trees, the slenderest that we know, twelve times as high as they were thick.

Thus their architecture is more elegant and lighter than that of Assyria.

The Persians had made little progress in the arts. But they seem to have been the most honest, the sanest, and the bravest people of the time. For two centuries they exercised in Asia a sovereignty the least cruel and the least unjust that it had ever known.

FOOTNOTES:

[28] That is, of about the same area as that part of the United States east of the Mississippi, with Minnesota and Iowa. Modern Persia is not two-thirds of this area.--ED.

[29] Most historians place Zoroaster before 1000 B.C.--ED.

[30] "I created the dog," said Ormuzd, "with a delicate scent and strong teeth, attached to man, biting the enemy to protect the herds. Thieves and wolves come not near the sheep-fold when the dog is on guard, strong in voice and defending the flocks."

[31] Certain Persian heretics of our day, on the contrary, adore only the evil god, for, they say, the principle of the good being in itself good and indulgent does not require appeasing. They are called Yezidis (worshippers of the devil).

CHAPTER VII

THE PHOENICIANS

THE PHOENICIAN PEOPLE

=The Land.=--Phoenicia is the narrow strip of country one hundred and fifty miles long by twenty-four to thirty wide, shut in between the sea of Syria and the high range of Lebanon. It is a succession of narrow valleys and ravines confined by abrupt hills which descend towards the sea; little torrents formed by the snows or rain-storms course through these in the early spring; in summer no water remains except in wells and cisterns. The mountains in this quarter were always covered with trees; at the summit were the renowned cedars of Lebanon, on the ridges, pines and cypresses; while lower yet palms grew even to the sea-shore. In the valleys flourished the olive, the vine, the fig, and the pomegranate.

=The Cities.=--At intervals along the rocky coast promontories or islands formed natural harbors. On these the Phoenicians had founded their cities; Tyre and Arad were each built on a small island. The people housed themselves in dwellings six to eight stories in height. Fresh water was ferried over in ships. The other cities, Gebel, Beirut, and Sidon arose on the mainland. The soil was inadequate to support these swarms of men, and so the Phoenicians were before all else seamen and traders.

=Phoenician Ruins.=--Not a book of the Phoenicians has come down to us, not even their sacred book. The sites of their cities have been excavated. But, in the words of the scholar sent to do this work, "Ruins are not preserved, especially in countries where people are not occupied with them," and the Syrians are not much occupied with ruins. They have violated the tombs to remove the jewels of the dead, have demolished edifices to secure stone for building purposes, and Mussulman hatred of chiseled figures has shattered the sculptures.[37] Very little is found beyond broken marble, cisterns, wine-presses cut in the rock and some sarcophagi hewn in rock. All this debris gives us little information and we know very little more of the Phoenicians than Greek writers and Jewish prophets have taught us.

=Political Organization of the Phoenicians.=--The Phoenicians never built an empire. Each city had its little independent territory, its assemblies, its king, and its government. For general state business each city sent delegates to Tyre, which from the thirteenth century B.C. was the principal city of Phoenicia. The Phoenicians were not a military people, and so submitted themselves to all the conquerors--Egyptians, Assyrians, Babylonians, Persians. They fulfilled all their obligations to them in paying tribute.

=Tyre.=--From the thirteenth century Tyre was the most notable of the cities. Its island becoming too small to contain it, a new city was built on the coast opposite. Tyrian merchants had founded colonies in every part of the Mediterranean, receiving silver from the mines of Spain and commodities from the entire ancient world. The prophet Isaiah[38] calls these traders princes; Ezekiel[39] describes the caravans which came to them from all quarters. It is Hiram, a king of Tyre, from whom Solomon asked workmen to build his palace and temple at Jerusalem.

=Carthage.=--A colony of Tyre surpassed even her in power. In the ninth century some Tyrians, exiled by a revolution, founded on the shore of Africa near Tunis the city of Carthage. A woman led them, Elissar, whom we call Dido (the fugitive). The inhabitants of the country, says the legend, were willing to sell her only as much land as could be covered by a bull's hide; but she cut the hide in strips so narrow that it enclosed a wide territory; and there she constructed a citadel. Situated at the centre of the Mediterranean,

provided with two harbors, Carthage flourished, sent out colonies in turn, made conquests, and at last came to reign over all the coasts of Africa, Spain, and Sardinia. Everywhere she had agencies for her commerce and subjects who paid her tribute.

=The Carthaginian Army.=--To protect her colonies from the natives, to hold her subjects in check who were always ready to revolt, a strong army was necessary. But the life of a Carthaginian was too valuable to risk it without necessity. Carthage preferred to pay mercenary soldiers, recruiting them among the barbarians of her empire and among the adventurers of all countries. Her army was a bizarre aggregation in which all languages were spoken, all religions practised, and in which every soldier wore different arms and costume. There were seen Numidians clothed in lion skins which served them as couch, mounted bareback on small fleet horses, and drawing the bow with horse at full gallop; Libyans with black skins, armed with pikes; Iberians from Spain in white garments adorned with red, armed with a long pointed sword; Gauls, naked to the girdle, bearing enormous shields and a rounded sword which they held in both hands; natives of the Balearic Islands, trained from infancy to sling with stones or balls of lead. The generals were Carthaginians; the government distrusted them, watched them closely, and when they were defeated, had them crucified.

=The Carthaginians.=--Carthage had two kings, but the senate was the real power, being composed of the richest merchants of the city. And so every state question for this government became a matter of commerce. The Carthaginians were hated by all other peoples, who found them cruel, greedy, and faithless. And yet, since they had a good fleet, had money to purchase soldiers, and possessed an energetic government, they succeeded in the midst of barbarous and divided peoples in maintaining their empire over the western Mediterranean for 300 years (from the sixth to the third century B.C.).

=The Phoenician Religion.=--The Phoenicians and the Carthaginians had a religion similar to that of the Chaldeans. The male god, Baal, is a sun-god; for the sun and the moon are in the eyes of the Phoenicians the great forces which create and which destroy. Each of the cities of Phoenicia has therefore its divine pair: at Sidon it is Baal Sidon (the sun) and Astoreth (the moon); at Gebel, Baal Tammouz and Baaleth; at Carthage, Baal-Hamon, and Tanith. But the same god changes his name according as he is conceived as creator or destroyer; thus Baal as destroyer is worshipped at Carthage under the name of Moloch. These gods, represented by idols, have their temples, altars, and priests. As creators they are honored with orgies, with tumultuous feasts; as destroyers, by human victims. Astoreth, the great goddess of Sidon, whom they represented by the crescent of the moon and the dove, had her cult in the sacred woods. Baal Moloch is figured at Carthage as a bronze colossus with arms extended and lowered. When they wished to appease him they laid children in his hands who fell at once into a pit of fire. During the siege of Carthage by Agathocles the principal men of the city sacrificed to Moloch as many as two hundred of their children.

This sensual and sanguinary religion inspired other peoples with horror, but they imitated it. The Jews sacrificed to Baal on the mountains; the Greeks adored Astarte of Sidon under the name of Aphrodite, and Baal Melkhart of Tyre under the name of Herakles.

PHOENICIAN COMMERCE

=Phoenicians Occupations.=--Crowded into a small territory, the Phoenicians gained their livelihood mainly from commerce. None of the other peoples of the East--the Egyptians, the Chaldeans, the Assyrians, nor the barbarian tribes of the West (Spaniards, Gauls, Italians) had a navy. The Phoenicians alone in this time dared to navigate. They were the commission merchants of the old world; they went to every people to buy their merchandise and sold them in exchange the commodities of other countries. This traffic was by caravan with the East, by sea with the West.

=Caravans.=--On land the Phoenicians sent caravans in three directions:

1.--Towards Arabia, from which they brought gold, agate, and onyx, incense and myrrh, and the perfumes of Arabia; pearls, spices, ivory, ebony, ostrich plumes and apes from India.

2.--Towards Assyria, whence came cotton and linen cloths, asphalt, precious stones, perfumery, and silk from China.

3.--Towards the Black Sea, where they went to receive horses, slaves, and copper vases made by the mountaineers of the Caucasus.

=Marine Commerce.=--For their sea commerce they built ships from the cedars of Lebanon to be propelled by oars and sails. In their sailing it was not necessary to remain always in sight of the coast, for they knew how to direct their course by the polar star. Bold mariners, they pushed in their little boats to the mouth of the Mediterranean; they ventured even to pass through the strait of

Gibraltar or, as the ancients called it, the Pillars of Hercules, and took the ocean course to the shores of England, and perhaps to Norway, Phoenicians in the service of a king of Egypt started in the seventh century B.C. to circumnavigate Africa, and returned, it is said, at the end of three years by the Red Sea. An expedition issuing from Carthage skirted the coast of Africa to the Gulf of Guinea; the commander Hanno wrote an account of the voyage which is still preserved.

=Commodities.=--To civilized peoples the Phoenicians sold the products of their industry. In barbarous countries they went to search for what they could not find in the Orient. On the coast of Greece they gathered shell-fish from which they extracted a red tint, the purple; cloths colored with purple were used among all the peoples of ancient times for garments of kings and great lords.

From Spain and Sardinia they brought the silver which the inhabitants took from the mines. Tin was necessary to make bronze, an alloy of copper and tin, but the Orient did not furnish this, and so they sought it even on the coasts of England, in the Isles of Tin (the Cassiterides). In every country they procured slaves. Sometimes they bought them, as lately the slavers bought negroes on the coast of Africa, for all the peoples of this time made commerce in slaves; sometimes they swooped down on a coast, threw themselves on the women and children and carried them off to be retained in their own cities or to be sold abroad; for on occasion they were pirates and did not scruple to plunder strangers.

=The Secrets Kept by the Phoenicians.=--The Phoenicians did not care to have mariners of other peoples come into competition with them. On the return from these far countries they concealed the road which they had travelled. No one in antiquity knew where were the famous Isles of the Cassiterides from which they got their tin. It was by chance that a Greek ship discovered Spain, with which the Phoenicians had traded for centuries. Carthage drowned the foreign merchants whom they found in Sardinia or on the shore of Gibraltar. Once a Carthaginian merchantman, seeing a strange ship following it, was run aground by the pilot that the foreigner might not see where he was going.

=Colonies.=--In the countries where they traded, the Phoenicians founded factories, or branch-houses. They were fortified posts on a natural harbor. There they landed their merchandise, ordinarily cloths, pottery, ornaments, and idols.[40] The natives brought down their commodities and an exchange was made, just as now European merchants do with the negroes of Africa. There were Phoenician markets in Cyprus, in Egypt, and in all the then barbarous countries of the Mediterranean--in Crete, Greece, Sicily, Africa, Malta, Sardinia, on the coasts of Spain at Malaga and Cadiz, and perhaps in Gaul at Monaco. Often around these Phoenician buildings the natives set up their cabins and the mart became a city. The inhabitants adopted the Phoenician gods, and even after the city had become Greek, the cult of the dove-goddess was found there (as in Cythera), that of the god Melkhart (as at Corinth), or of the god with the bull-face that devours human victims (as in Crete).

=Influence of the Phoenicians.=--It is certain that the Phoenicians in founding their trading stations cared only for their own interest. But it came to pass that their colonies contributed to civilization. The barbarians of the West received the cloths, the jewels, the utensils of the peoples of the East who were more civilized, and, receiving them, learned to imitate them. For a long time the Greeks had only vases, jewels, and idols brought by the Phoenicians, and these served them as models. The Phoenicians brought simultaneously from Egypt and from Assyria industry and commodities.

=The Alphabet.=--At the same time they exported their alphabet. The Phoenicians did not invent writing. The Egyptians knew how to write many centuries before them, they even made use of letters each of which expressed its own sound, as in our alphabet. But their alphabet was still encumbered with ancient signs which represented, some a syllable, others an entire word. Doubtless the Phoenicians had need of a simpler system for their books of commerce. They rejected all the syllabic signs and ideographs, preserving only twenty-two letters, each of which marks a sound (or rather an articulation of the language). The other peoples imitated this alphabet of twenty-two letters. Some, like the Jews, wrote from right to left just as the Phoenicians themselves did; others, like the Greeks, from left to right. All have slightly changed the form of the letters, but the Phoenician alphabet is found at the basis of all the alphabets--Hebrew, Lycian, Greek, Italian, Etruscan, Iberian, perhaps even in the runes of the Norse. It is the Phoenicians that taught the world how to write.

FOOTNOTES:

[37] Renan ("Mission de Phenicio," p. 818) says, "I noticed at Tripolis a sarcophagus serving as a public fountain and the sculptured face of it was turned to the wall. I was told that a governor had placed it thus so as not to provide distractions for the inhabitants."

[38] See ch. xxiii.

[39] See chs. xxvi., xxvii., xxviii.

[40] These idols, one of their principal exports, are found wherever the Phoenicians traded.

CHAPTER VIII

THE HEBREWS

ORIGIN OF THE HEBREW PEOPLE

=The Bible.=--The Jews united all their sacred books into a single aggregation which we call by a Greek name the Bible, that is to say, the Book. It is the Book par excellence. The sacred book of the Jews became also the sacred book of the Christians. The Bible is at the same time the history of the Jewish nation, and all that we know of the sacred people we owe to the sacred books.

=The Hebrews.=--When the Semites had descended from the mountains of Armenia into the plains of the Euphrates, one of their tribes, at the time of the first Chaldean empire, withdrew to the west, crossed the Euphrates, the desert, and Syria and came to the country of the Jordan beyond Phoenicia. This tribe was called the Hebrews, that is to say, the people from beyond the river. Like the majority of the Semites they were a race of nomadic shepherds. They did not till the soil and had no houses; they moved from place to place with their herds of cattle, sheep, and camels, seeking pasturage and living in tents as the Arabs of the desert do to this day. In the book of Genesis one has a glimpse of this nomad life.

=The Patriarchs.=--The tribe was like a great family; it was composed of the chief, his wives, his children, and his servants. The chief had absolute authority over all; for the tribe he was father, priest, judge, and king. We call these tribal chiefs patriarchs. The principal ones were Abraham and Jacob; the former the father of the Hebrews, the latter of the Israelites. The Bible represents both of them as designed by God to be the scions of a sacred people. Abraham made a covenant with God that he and his descendants would obey him; God promised to Abraham a posterity more numerous than the stars of heaven. Jacob received from God the assurance that a great nation should issue from himself.

=The Israelites.=--Moved by a vision Jacob took the name of Israel (contender with God). His tribe was called Beni-Israel (sons of Israel) or Israelites. The Bible records that, driven by famine, Jacob abandoned the Jordan country to settle with all his house on the eastern frontier of Egypt, to which Joseph, one of his sons who had become minister of a Pharaoh, invited him. There the sons of Israel abode for several centuries. Coming hither but seventy in number, they multiplied, according to the Bible, until they became six hundred thousand men, without counting women and children.

=The Call of Moses.=--The king of Egypt began to oppress them, compelling them to make mortar and bricks for the construction of his strong cities. It was then that one of them, Moses, received from God the mission to deliver them. One day while he was keeping his herds on the mountain, an angel appeared to him in the midst of a burning bush, and he heard these words: "I am the God of Abraham, the God of Isaac, the God of Jacob. I have seen the affliction of my people which is in Egypt, I have heard their cry against their oppressors, I know their sorrows. And I am come down to deliver them out of the hands of the Egyptians and to bring them to a land flowing with milk and honey, to the place of the Canaanites.... Come now therefore and I will send thee unto Pharaoh that thou mayest bring forth my people, the children of Israel, out of Egypt."[41] The Israelites under the guidance of Moses fled from Egypt (the Exodus); they journeyed to the foot of Mount Sinai, where they received the law of God, and for an entire generation wandered in the deserts to the south of Syria.

=Israel in the Desert.=--Often the Israelites wished to turn back. "We remember," said they, "the fish which we ate in Egypt, the cucumbers, melons, leeks, and onions. Let us appoint a chief who will lead us back to Egypt." Moses, however, held them to obedience. At last they reached the land promised by God to their race.

=The Promised Land.=--It was called the land of Canaan or Palestine; the Jews named it the land of Israel, later Judea. Christians have termed it =the= Holy Land. It is an arid country, burning with heat in the summer, but a country of mountains. The Bible describes it thus: "Jehovah thy God bringeth thee into a good land, a land of brooks of water, of fountains and depths that spring out of valleys and hills, a land of wheat, and barley, and vines, and fig-trees, and pomegranates; a land of oil olive and honey, wherein thou shalt eat bread without scarceness, thou shalt not lack anything in it." The Israelites according to their estimate were then 601,700 men capable of bearing arms, divided among twelve tribes, ten descended from Jacob, two from Joseph; this enumeration does not include the Levites or priests to the number of 23,000. The land was occupied by several small peoples who were called Canaanites. The Israelites exterminated them and at last occupied their territory.

THE RELIGION OF ISRAEL

=One God.=--The other ancient peoples adored many gods; the Israelites believed in but one God, immaterial, who made the world and governs it. "In the beginning," says the book of Genesis, "God created the heavens and the earth." He created plants and animals, he "created man in his own image." All men are the handiwork of God.

=The People of God.=--But among all mankind God has chosen the children of Israel to make of them "his people." He called Abraham and said to him, "I will establish my covenant between me and thee and thy seed after me ... to be a God unto thee and to thy seed." He appeared to Jacob: "I am God," said he to him, "the God of thy father; fear not to go down into Egypt, for I will make of thee there a great nation." When Moses asks his name, he replies, "Thou shalt say to the children of Israel, The Lord, the God of thy fathers, the God of Abraham, the God of Isaac, the God of Jacob hath sent me unto you. This is my name forever."

=The Covenant.=--There is, then, a covenant between the Israelites and God. Jehovah (the Eternal) loves and protects the Israelites, they are "a holy nation," "his most precious jewel among all the nations." He promises to make them mighty and happy. In return, the Israelites swear to worship him, to serve him, to obey him in everything as a lawgiver, a judge, and a sovereign.

=The Ten Commandments.=--Jehovah, lawgiver of the Israelites, dictated his precepts to Moses on Mount Sinai amidst lightnings and thunderings. They were inscribed on two tables, the Tables of the Law, in these terms:

"Hear, O Israel, I am Jehovah, thy God, who brought you out of the land of Egypt, from the land of bondage." (Then follow the ten commandments to be found in the twentieth chapter of the book of Exodus.)

=The Law.=--Beside the ten commandments, the Israelites are required to obey many other divine ordinances. These are all delivered to them in the first five books of the Bible, the Pentateuch, and constitute the Law of Israel. The Law regulates the ceremonies of religion, establishes the feasts--including the Sabbath every seven days, the Passover in memory of the escape from Egypt, the week of harvest, the feast of Tabernacles during the vintage; it organizes marriage, the family, property, government, fixes the penalty of crimes, indicates even foods and remedies. It is a code at once religious, political, civil and penal. God the ruler of the Israelites has the right to regulate all the details of their lives.

=Religion has made the Jewish People.=--The Israelites did not receive with docility the government of God. Moses on his death-bed could say to the Levites in delivering to them the book of the law, "Take this book that it may be a witness against you, Israel, for I know thy rebellion and thy stiff neck" (Deut. xxxi. 27). "During my life you have been rebellious against the Lord, and how much more after my death." During these centuries some of the Israelites, often the majority of the nation, had been idolaters. They became similar to the other Semites of Syria. Only the Israelites who remained faithful to God formed the Jewish people. It is the religion of Jehovah which has transformed an obscure tribe into the holy nation, a small nation, but one of the most significant in the history of the world.

THE KINGDOM OF ISRAEL

=The Judges.=--Once established in Palestine the Hebrews remained divided for several centuries. "In those days," says the Bible, "there was no king in Israel; every man did that which was right in his own eyes." Often the Israelites forgot Jehovah and served the gods of neighboring tribes. Then "the anger of the Lord was kindled against the Israelites, and he delivered them into the hands of their enemies." When they had repented and had humbled themselves, "the Lord raised up judges who delivered them out of the hand of those that spoiled them." "But it came to pass that at the death of the judge they corrupted themselves anew ... bowing themselves to other gods." These judges--Gideon, Jephthah, Samson--were warriors who came in the name of Jehovah to free the people. Then they fell at once into idolatry again and their servitude was repeated.

=The Kings.=--At last the Israelites were wearied and asked of Samuel, the high-priest, that he would give them a king. Samuel unwillingly placed Saul at their head. This king should have been the ready servant of the will of God; he dared to disobey him, upon which the high-priest said to him, "Thou hast rejected the word of the Lord and the Lord hath rejected thee from being king over Israel." A war-chief, David, was set in his place. He defeated all the enemies of Israel, captured from them Mount Zion, and transferred his capital thither. This was Jerusalem.

=Jerusalem.=--Compared with Babylon or Thebes, Jerusalem was a poor capital. The Hebrews were not builders; their religion prevented them from raising temples; the houses of individuals were shaped like cubes of rock which may be seen today on the sides of Lebanon in the midst of vines and fig-trees. But Jerusalem was the holy city of the Hebrews. The king had his palace

there--the palace of Solomon, who astonished the Hebrews with his throne of ivory; Jehovah had his temple there, the first Hebrew temple.

=The Tabernacle.=--The emblem of the covenant between God and Israel was a great chest of cedar-wood furnished with rings of gold, which contained the tables of the Law. This was borne before the people on high feast-days; it was the Ark of the Covenant. To preserve this ark and necessary objects of worship, Moses is said to have made the Tabernacle--a pavilion of wood covered with skins and hangings. It was a portable temple which the Hebrews carried with them until they could erect a true temple in the promised land.

=The Temple.=--The Temple of Jerusalem, built at last under Solomon, was divided into three parts:

1.--To the rear, the Holy of Holies, in which rested the ark of the covenant; the high-priest only had the right to enter here, and that but once a year.

2.--In the middle, the Holy Place, in which were kept the altar of incense, the candle-stick with the seven arms, the table of shew-bread; the priests entered to burn incense and to present the offerings.

3.--At the front, the Court open to the people, where the victims were sacrificed on the great altar.

The Temple of Jerusalem was from the first the centre of the nation; from all Palestine the people came to be present at the ceremonies. The high-priest who directed the worship was a person sometimes of greater power than the king.

THE PROPHETS

=Disasters of Israel.=--Solomon was the last king who enjoyed great power. After him ten tribes separated themselves and constituted the kingdom of Israel, whose inhabitants worshipped the golden calves and the gods of the Phoenicians. Two tribes only remained faithful to Jehovah and to the king at Jerusalem; these formed the kingdom of Judah (977).[42] The two kingdoms exhausted their energies in making war on each other. Then came the armies of the Eastern conquerors; Israel was destroyed by Sargon, king of Assyria (722); Judah, by Nabuchodonosor (Nebuchadrezzar), king of Chaldea (586).

=Sentiments of the Israelites.=--Faithful Israelites regarded these woes as a chastisement: God was punishing his people for their disobedience; as before, he delivered them from their conquerors. "The children of Israel had sinned against Jehovah, their God, they had built them high places in every city, they imitated the nations around them, although the Lord had forbidden them to do like them; they made them idols of brass; they bowed themselves before all the host of heaven [the stars], they worshipped Baal. It is for this that Jehovah rejected all the race of Israel, he afflicted them and delivered them into the hands of those that plundered them."

=The Prophets.=--Then appeared the prophets, or as they were called, the Seers: Elijah, Jeremiah, Isaiah, Ezekiel. Usually they came from the desert where they had fasted, prayed, and given themselves to meditation. They came in the name of Jehovah, not as warriors in judgment, but as preachers. They called the Israelites to repent, to overthrow their idols, to return to Jehovah; they foretold all the woes that would come upon them if they did not reconcile themselves to him. They preached and uttered prophecies at the same time.

=The New Teaching.=--These men on fire with the divine spirit found the official religion at Jerusalem mean and cold. Why should they, like the idolaters, slaughter cattle and burn incense to the honor of God? "Hear the word of Jehovah," says Isaiah: "To what purpose is the multitude of your sacrifices? I am full of the burnt offerings of rams and of the fat of fed beasts; and I delight not in the blood of bullocks, or of lambs, or of he-goats.... Bring no more vain oblations, your incense is an abomination to me.... When ye spread forth your hands, I will hide mine eyes from you ... for your hands are full of blood. Wash you, make you clean ... cease to do evil, learn to do well; seek judgment, relieve the oppressed, judge the fatherless, plead for the widow.... Though your sins be as scarlet, they shall be as white as snow." In place of sacrifices, the prophets would set justice and good works.

=The Messiah.=--Israel deserved its afflictions, but there would be a limit to the chastisement. "O my people," says Isaiah in the name of Jehovah, "be not afraid of the Assyrian: he shall smite thee with a rod ... after the manner of Egypt ... for yet a very little while and the indignation shall cease ... and the burden shall be taken away from off thy shoulder." The prophets taught the people to look for the coming of Him who should deliver them; they prepared the way for the Messiah.

THE JEWISH PEOPLE

=Return to Jerusalem.=--The children of Judah, removed to the plain of the Euphrates, did not forget their country, but sang of it in their chants: "By the rivers of Babylon, there we sat down, yea, we wept when we remembered Zion. We hanged our harps upon the willows in the midst thereof, for there they that carried us away required a song ... saying, 'Sing us one of the songs of Zion.' How shall we sing the Lord's song in a strange land?" After seventy years of captivity, Cyrus, victor over Babylon, allowed the Israelites to return to Palestine. They rebuilt Jerusalem, reconstructed the temple, restored the feasts, and recovered the sacred books. As a sign that they were again the people of Jehovah they renewed the covenant with him; it was a formal treaty, written and signed by the chiefs of the people.

=The Jews.=--The little kingdom of Jerusalem maintained itself for seven centuries, governed now by a king, now by the high-priest, but always paying tribute to the masters of Syria--to the Persians first, later to the Macedonians and the Syrians, and last of all to the Romans. Faithful to the end to Jehovah, the Jews (their proper name since the return) continued to live the law of Moses, to celebrate at Jerusalem the feasts and the sacrifices. The high-priest, assisted by a council of the elders, preserved the law; scribes copied it and doctors expounded it to the people. The faithful obliged themselves to observe it in the smallest details. The Pharisees were eminent among them for their zeal in fulfilling all its requirements.

=The Synagogues.=--Meanwhile the Jews for the sake of trade were pushing beyond the borders of Judaea into Egypt, Syria, Asia Minor, and even to Italy. Some of them were to be found in all the great cities--Alexandria, Damascus, Antioch, Ephesus, Corinth and Rome. Dispersed among the Gentiles, the Jews were strenuous to preserve their religion. They raised no temples, for the law prevented this; there could be but one Jewish temple, that at Jerusalem, where they celebrated the solemn feasts. But they joined themselves together to read and comment on the word of God. These places of assembling were called Synagogues, from a Greek word signifying meetings.

=Destruction of the Temple.=--The Christ appeared at this moment. The Jews crucified him and persecuted his disciples not only in Judaea but in every city where they found them in any number. In the year 70 A.D. Jerusalem, in revolt against the Romans, was taken by assault, and all the inhabitants were massacred or sold into slavery. The Romans burnt the temple and carried away the sacred utensils. From that time there was no longer a centre of the Jewish religion.

=Fortunes of the Jews after the Dispersion.=--The Jewish nation survived the ruin of its capital. The Jews, scattered throughout the world, learned to dispense with the temple. They preserved their sacred books in the Hebrew tongue. Hebrew is the primitive language of Israel; the Jews since the return from Babylon no longer spoke it, but adopted the languages of the neighboring peoples--the Syriac, the Chaldean, and especially the Greek. The Rabbis, however, instructed in the religion, still learned the Hebrew, explained it, and commented on the Scripture.[43] Thus the Jewish religion was preserved, and, thanks to it, the Jewish people. It made converts even among the Gentiles; there were in the empire proselytes, that is, people who practised the religion of Jehovah without being of the Jewish race.

The Christian Church, powerful since the fourth century, commenced to persecute the Jews. This persecution has endured to this day in all Christian countries. Usually the Jews were tolerated on account of their wealth and because they transacted all banking operations; but they were kept apart, not being permitted to hold any office. In the majority of cities they were compelled to wear a special costume, to live in a special quarter,[44] gloomy, filthy, unhealthy, and sometimes at Easter time to send one of their number to suffer insult. The people suspected them of poisoning fountains, of killing children, of profaning the consecrated host; often the people rose against them, massacred them, and pillaged their houses. Judges under the least pretext had them imprisoned, tortured, and burned. Sometimes the church tried to convert them by force; sometimes the government exiled them _en masse_ from the country and confiscated their goods. The Jews at last disappeared from France,[45] from Spain, England, and Italy. In Portugal, Germany, and Poland, and in the Mohammedan lands they maintained themselves. From these countries after the cessation of persecution they returned to the rest of Europe.

FOOTNOTES:

[41] Exodus iii, 1-10.

[42] There is much uncertainty regarding the chronology of this period.--ED.

[43] The Talmud is the accumulation of these commentaries.

[44] The Jewish Quarter at Rome was called the Ghetto. This name has since been applied to all Jewish quarters.

[45] Except at Avignon, on the domains of the Pope, and in Alsace-Lorraine.

CHAPTER IX

GREECE AND THE GREEKS

=The Country.=--Greece is a very little country (about 20,000 square miles), hardly larger than Switzerland; but it is a country of great variety, bristling with mountains, indented with gulfs--a country originally constituted to influence mightily the character of the men who inhabited it.

A central chain, the Pindus, traverses Greece through the centre and covers it with its rocky system. Toward the isthmus of Corinth it becomes lower; but the Peloponnesus, on the other side of the isthmus, is elevated about 2,000 feet above the sea level, like a citadel crowned with lofty chains, abrupt and snowy, which fall perpendicularly into the sea. The islands themselves scattered along the coast are only submerged mountains whose summits rise above the surface of the sea. In this diverse land there is little tillable ground, but almost everywhere bare rock. The streams, like brooks, leave between their half-dried channel and the sterile rock of the mountain only a narrow strip of fertile soil. In this beautiful country are found some forests, cypresses, laurels, palms, here and there vines scattered on the rocky hillsides; but there are no rich harvests and no green pasturages. Such a country produces wiry mountaineers, active and sober.

=The Sea.=--Greece is a land of shores: smaller than Portugal, it has as great a coast-line as Spain. The sea penetrates it to a great number of gulfs, coves, and indentations; it is ordinarily surrounded with projecting rocks, or with approaching islands that form a natural port. This sea is like a lake; it has not, like the ocean, a pale and sombre color; usually it is calm, lustrous, and, as Homer says, "of the color of violets."

No sea lends itself better to navigation with small ships. Every morning the north wind rises to conduct the barques of Athens to Asia; in the evening the south wind brings them back to port. From Greece to Asia Minor the islands are placed like stepping-stones; on a clear day the mariner always has land in view. Such a sea beckons people to cross it.

And so the Greeks have been sailors, traders, travellers, pirates, and adventurers; like the Phoenicians, they have spread over all the ancient world, carrying with them the merchandise and the inventions of Egypt, of Chaldea, and of Asia.

=The Climate.=--The climate of Greece is mild. In Athens it freezes hardly once in twenty years; in summer the heat is moderated by the breeze from the sea.[46] Today the people still lie in the streets from the month of May to September. The air is cool and transparent; for many leagues could once be seen the crest of the statue of Pallas. The contours of distant mountains are not, as with us, enveloped in haze, but show a clear line against the clear sky. It is a beautiful country which urges man to take life as a feast, for everything is happy about him. "Walking at night in the gardens, listening to the grasshoppers, playing the lute in the clear of the moon, going to drink at the spring at the mountain, carrying with him some wine that he may drink while he sings, spending the days in dancing--these are Greek pleasures, the joys of a race poor, economical, and eternally young."

=Simplicity of Greek Life.=--In this country men are not melted with the heat nor stiffened with cold; they live in the open air gay and at slight expense. Food in great quantity is not required, nor warm clothing, nor a comfortable house. The Greek could live on a handful of olives and a sardine. His entire clothing consisted of sandals, a tunic, a large mantle; very often he went bare-footed and bare-headed. His house was a meagre and unsubstantial building; the air easily entered through the walls. A couch with some coverings, a coffer, some beautiful vases, a lamp,--this was his furniture. The walls were bare and whitened with lime. This house was only a sleeping place.

THE PEOPLE

=Origin of the Greeks.=--The people who inhabited this charming little land were an Aryan people, related to the Hindoos and the Persians, and like them come from the mountains of Asia or the steppes beyond the Caspian Sea. The Greeks had forgotten the long journey made by their ancestors; they said that they, like the grasshoppers, were the children of the soil.[47] But their language and the names of their gods leave no doubt of their origin.... Like all the Aryans, the primitive Greeks nourished themselves with milk and with the flesh of their herds; they moved about under arms, always ready to fight, and grouped themselves in tribes governed by patriarchs.

=The Legends.=--The Greeks like all the other ancient peoples were ignorant of their origin. They neither knew whence their ancestors had come nor when they had established themselves in Greece, nor what they had done there. To preserve the exact memory of things as they occur, there is need of some means of fixing them; but the Greeks did not know how to write; they did not employ writing until about the eighth century B.C. They had no way of calculating the number of years. Later they adopted the usage of counting the years according to the great feast which was celebrated every four years at Olympia; a period of four years was called an olympiad. But the first olympiad was placed in 776 B.C., and the chronology of the Greeks does not rise beyond this date.

And yet they used to tell in Greece a great number of legends about this primitive period. These were especially the exploits of ancient kings and of heroes who were adored as demi-gods. These stories were so mingled with fable that it is impossible to know how much truth they may contain. They said at Athens that the first king, Cecrops, was half man and half serpent; at Thebes, that Cadmus, founder of the city, had come from Phoenicia to seek his sister Europa who had been stolen by a bull; that he had killed a dragon and had sowed his teeth, from which was sprung a race of warriors, and that the noble families of Thebes descended from these warriors. At Argos it was said that the royal family was the issue of Pelops to whom Zeus had given a shoulder of ivory to replace the one devoured by a goddess. Thus each country had its legends and the Greeks continued to the end to relate them and to offer worship to their ancient heroes--Perseus, Bellerophon, Herakles, Theseus, Minos, Castor and Pollux, Meleager, OEdipus. The majority of the Greeks, even among the better educated, admitted, at least in part, the truth of these traditions. They accepted as historical facts the war between the two sons of OEdipus, king of Thebes, and the expedition of the Argonauts, sailing forth in quest of the Golden Fleece, which was guarded by two brazen-footed bulls vomiting flames.

=The Trojan War.=--Of all these legends the most fully developed and the most celebrated was the legend of the Trojan War. It recounted that about the twelfth century, Troy, a rich and powerful city, held sway over the coast of Asia. Paris, a Trojan prince, having come to Greece, had abducted Helen, wife of Menelaus, king of Sparta. Agamemnon, king of Argos, made a league of the kings of Greece; a Greek army went in a fleet of two hundred galleys to besiege Troy. The siege endured ten years because the supreme god, Zeus, had taken the side of the Trojans. All the Greek chiefs participated in this adventure. Achilles, the bravest and the most beautiful of these, killed Hector, the principal defender of Troy, and dragged his corpse around the city; he fought clad in divine armor which had been presented him by his mother, a goddess of the sea; in turn he died, shot by an arrow in the heel. The Greeks, despairing of taking the city by force, employed a trick: they pretended to depart, and left an immense horse of wood in which were concealed the chiefs of the army. The Trojans drew this horse into the city; during the night the chiefs came forth and opened the city to the Greeks. Troy was burnt, the men slaughtered, the women led away as slaves. But the chiefs of the Greeks on their return were beset by tempest. Some perished in the sea, others were cast on foreign shores. Odysseus, the most crafty of the chiefs, was for ten years buffeted from one land to another, losing successively all his ships, himself the sole survivor of the disasters.

All antiquity had steadfast faith in the Trojan War. 1184 B.C. was set as the date of the ending of the siege, and men pointed out the site of the city. In 1874 Schliemann purposed to excavate this site; it was necessary to traverse the debris of many cities which lay over it; at last at a depth of about fifty feet he found in the deepest bed of debris the traces of a mighty city reduced to ashes, and in the ruins of the principal edifice a casket filled with gems of gold which he called the Treasury of Priam. There was no inscription, and the city, the whole wall of which we have been able to bring to light, was a very small one. A large number of small, very rude idols have been found, which represent an owl-headed goddess (the Greeks thus represented the goddess Pallas). Beyond this no proof has been found that this city was called Troy.

=The Homeric Poems.=--It is the two poems attributed to Homer which have made the taking of Troy renowned throughout the world--the Iliad, which related the combats of the Greeks and the exploits of Achilles before Troy; and the Odyssey, which recounts the adventures of Odysseus (Ulysses) after the capture of Troy.

These two poems were handed down for centuries without being committed to writing; the rhapsodists, wandering singers, knew long passages from them by heart and recited them at feasts. It is not till the sixth century that Pisistratus, a prince of Athens, had them collected and edited.[48] The two poems became from that time and always remained the most admired works of Greek literature.

The Greeks said that the author of these poems was Homer, a Greek of Ionia, who lived about the tenth or the ninth century B.C. They represented him as a blind old man, poor and a wanderer. Seven towns disputed the honor of being his birth-place. This tradition was received without hesitation. But at the end of the eighteenth century a German scholar, Wolf, noticed certain

contradictions in these poems, and at last asserted that they were not the work of a single poet, but a collection of fragments from several different poets. This theory has been attacked and supported with great energy: for a half century men have flown into a passion for or against the existence of Homer. Today we begin to think the problem insoluble. What is certain is that these poems are very old, probably of the ninth century. The Iliad was composed in Asia Minor and is perhaps the result of the union of two poems--one dedicated to the combats of the Trojans, and the other to the adventures of Achilles. The Odyssey appears to be the work of one author; but it cannot be affirmed that it is of the same author as the Iliad.

=The Greeks at the Time of Homer.=--We are not able to go back very far in the history of the Greeks; the Homeric poems are their oldest historical document. When these were composed, about the ninth century B.C., there was not yet any general name to designate all the inhabitants of Greece: Homer mentions them under the names of their principal tribes. From his description it appears that they have made some progress since their departure from Asia. They know how to till the ground, how to construct strong cities and to organize themselves into little peoples. They obey kings; they have a council of old men and an assembly of the people. They are proud of their institutions, they despise their less advanced neighbors, the Barbarians, as they call them. Odysseus, to show how rude the Cyclops were, says, "They have no rules of justice nor places where they deliberate; each one governs himself, his wife, and children, and has no association with others." But these Greeks themselves are half barbarians; they do not know how to write, to coin money, nor the art of working in iron. They hardly dare to trust themselves on the sea and they imagine that Sicily is peopled with monsters.

=The Dorians.=--Dorians was the name given to those sons of the mountaineers who had come from the north and had expelled or subjected those dwelling in the plains and on the shore of the Peloponnesus; the latter, crowded into too narrow limits, sent colonies into Asia. Of these mountain bands the most renowned came from a little canton called Doris and preserved the name Dorians. These invaders told how certain kings of Sparta, the posterity of Herakles, having been thrust out by their subjects, had come to seek the Dorians in their mountains. These people of the mountains, moved by their love for Herakles, had followed his descendants and had replaced them on their throne. By the same stroke they dispossessed the inhabitants and took their place. They were a martial, robust, and healthy race, accustomed to cold, to meagre food, to a scant existence. Men and women wore a short tunic which did not reach to the knee. They spoke a rude and primitive dialect. The Dorians were a race of soldiers, always obliged to keep themselves under arms; they were the least cultivated in Greece, since, situated far from the sea, they preserved the customs of the barbarous age; they were the most Greek because, being isolated, they could neither mingle with strangers nor imitate their manners.

=The Ionians.=--The peoples of Attica, the isles, and the coast of Asia were called Ionians; no one knows the origin of the name. Unlike the Dorians, they were a race of sailors or traders, the most cultured of Greece, gaining instruction from contact with the most civilized peoples of the Orient; the least Greek, because they associated with Asiatics and had in part adopted their dress. They were peaceful and industrious, living luxuriously, speaking a smooth dialect, and wearing long flowing garments like the Orientals.

=The Hellenes.=--Dorians and Ionians--these are the two opposing races, the most remarkable of Greece, and the most powerful: Sparta is Dorian, Athens is Ionian. But the majority of the Greeks are neither Dorians nor Ionians: they are called AEolians, a vague name which covers very different peoples.

All the Greeks from early times take the name "Hellenes" which they have kept to this day. What is the origin of the term? They did not know any more than we: they said only that Dorus and AEolus were sons of Hellen, and Ion was his grandson.

=Cities.=--The Hellenes were still in little peoples as at the time of Homer. The land of Greece, cut by mountains and sea, breaks naturally into a large number of small cantons, each isolated from its neighbor by an arm of the sea or by a wall of rocks, so that it is easy to defend the land and difficult to communicate with other parts. Each canton constituted a separate state which was called a city. There were more than a hundred of these; counting the colonies, more than a thousand. To us a Greek state seems a miniature. The whole of Attica was but little larger than the state of Delaware, and Corinth or Megara was much smaller. Usually the state was only a city with a strip of shore and a harbor, or some villages scattered in the plain around a citadel. From one state one sees the citadel, mountains, or harbor of the next state. Many of them count their citizens only by thousands; the largest included hardly 200,000 or 300,000.

The Hellenes never formed one nation; they never ceased to fight and destroy one another. And yet all spoke the same language, worshipped the same gods, and lived the same sort of a life. In these respects they recognized the bonds of a common race and

distinguished themselves from all other peoples whom they called barbarians and regarded with disdain.

THE HELLENES BEYOND SEA

=Colonization.=--The Hellenes did not inhabit Greece alone. Colonists from the Greek cities had gone forth to found new cities in all the neighboring countries. There were little states in all the islands of the Archipelago, over all the coast of Asia Minor, in Crete and Cyprus, on the whole circumference of the Black Sea as far as the Caucasus and the Crimea, along the shore of Turkey in Europe (then called Thrace), on the shore of Africa, in Sicily, in south Italy, and even on the coasts of France and Spain.

=Character of These Colonies.=--Greek colonies were being founded all the time from the twelfth century to the fifth; they issued from various cities and represented all the Greek races--Dorian, Ionian, and AEolian. They were established in the wilderness, in an inhabited land, by conquest, or by an agreement with the natives. Mariners, merchants, exiles, or adventurers were their founders. But with all this diversity of time, place, race, and origin, the colonies had common characteristics: they were established at one stroke and according to certain fixed rules. The colonists did not arrive one by one or in small bands; nor did they settle at random, building houses which little by little became a city, as is the case now with European colonists in America. All the colonists started at once under a leader, and the new city was founded in one day. The foundation was a religious ceremony; the "founder" traced a sacred enclosure, constructed a sacred hearth, and lighted there the holy fire.

=Traditions Concerning the Colonists.=--The old stories about the founding of some of these colonies enable us to see how they differed from modern colonies. The account of the settlement of Marseilles runs as follows: Euxenus, a citizen of Phocaea, coming to Gaul in a merchant galley, was invited by a Gallic chief to the marriage of his daughter; according to the custom of this people, the young girl about the time of the feast entered bearing a cup which she was to present to the one whom she would choose for a husband; she stopped before the Greek and offered him the cup. This unpremeditated act appeared to have been inspired from heaven; the Gallic chief gave his daughter to Euxenus and permitted him and his companions to found a city on the gulf of Marseilles. Later the Phocaeans, seeing their city blockaded by the Persian army, loaded on their ships their families, their movables, the statues and treasures of their temple and went to sea, abandoning their city. As they started, they threw into the sea a mass of red-hot iron and swore never to return to Phocaea until the iron should rise to the surface of the water. Many violated this oath and returned; but the rest continued the voyage and after many adventures came to Marseilles.

At Miletus the Ionians who founded the city had brought no wives with them; they seized a city inhabited by the natives of Asia, slaughtered all the men, and forcibly married the women and girls of the families of their victims. It was said that the women, affronted in this manner, swore never to eat food with their captors and never to call them by the name of husband; this custom was for centuries preserved among the women of Miletus.[49]

The colony at Cyrene in Africa was founded according to the express command of the oracle of Apollo. The inhabitants of Thera, who had received this order, did not care to go to an unknown country. They yielded only at the end of seven years since their island was afflicted with dearth; they believed that Apollo had sent misfortune on them as a penalty. Nevertheless the citizens who were sent out attempted to abandon the enterprise, but their fellow-citizens attacked them and forced them to return. After having spent two years on an island where no success came to them, they at last came to settle at Cyrene, which soon became a prosperous city.[50]

=Importance of the Colonies.=--Wherever they settled, the colonists constituted a new state which in no respect obeyed the mother town from which they had come out. And so the whole Mediterranean found itself surrounded by Greek cities independent one of the others. Of these cities many became richer and more powerful than their mother towns; they had a territory which was larger and more fertile, and in consequence a greater population. Sybaris, it was said, had 300,000 men who were capable of bearing arms. Croton could place in the field an infantry force of 120,000 men. Syracuse in Sicily, Miletus in Asia had greater armies than even Sparta and Athens. South Italy was termed Great Greece. In comparison with this great country fully peopled with Greek colonies the home country was, in fact, only a little Greece. And so it happened that the Greeks were much more numerous in the neighboring countries than in Greece proper; and among these people of the colonies figure a good share of the most celebrated names: Homer, Alcaeus, Sappho, Thales, Pythagoras, Heraclitus, Democritus, Empedocles, Aristotle, Archimedes, Theocritus, and many others.

CHAPTER X

GREEK RELIGION

=The Gods. Polytheism.=--The Greeks, like the ancient Aryans, believed in many gods. They had neither the sentiment of infinity nor that of eternity; they did not conceive of God as one for whom the heavens are only a tent and the earth a foot-stool. To the Greeks every force of nature--the air, the sun, the sea--was divine, and as they did not conceive of all these phenomena as produced by one cause, they assigned each to a particular god. This is the reason that they believed in many gods. They were polytheists.

=Anthropomorphism.=--Each god was a force in nature and carried a distinct name. The Greeks, having a lively imagination, figured under this name a living being, of beautiful form and human characteristics. A god or goddess was represented as a beautiful man or woman. When Odysseus or Telemachus met a person peculiarly great and beautiful, they began by asking him if he were not a god. Homer in describing the army pictured on the shield of Achilles adds, "Ares and Athena led the army, both clad in gold, beautiful and great, as becomes the gods, for men were smaller." Greek gods are men; they have clothing, palaces, bodies similar to ours; if they cannot die, they can at least be wounded. Homer relates how Ares, the god of war, struck by a warrior, fled howling with pain. This fashion of making gods like men is what is called _Anthropomorphism_.

=Mythology.=--The gods, being men, have parents, children, property. Their mothers were goddesses, their brothers were gods, and their children other gods or men who were half divine. This genealogy of the gods is what is called the _Theogony_. The gods have also a history; we are told the story of their birth, the adventures of their youth, their exploits. Apollo, for example, was born on the island of Delos to which his mother Latona had fled; he slew a monster which was desolating the country at the foot of Parnassus. Each canton of Greece had thus its tales of the gods. These are called myths; the sum of them is termed _Mythology_, or the history of the gods.

=The Local Gods.=--The Greek gods, even under their human form, remained what they were at first, phenomena of nature. They were thought of both as men and as forces of nature. The Naiad is a young woman, but at the same time a bubbling fountain. Homer represents the river Xanthus as a god, and yet he says, "The Xanthus threw itself on Achilles, boiling with fury, full of tumult, foam, and the bodies of the dead." The people itself continued to say "Zeus rains" or "Zeus thunders." To the Greek the god was first of all rain, storm, heaven, or sun, and not the heaven, sun, or earth in general, but that corner of the heaven under which he lived, the land of his canton, the river which traversed it. Each city, then, had its divinities, its sun-god, its earth-goddess, its sea-god, and these are not to be confounded with the sun, the earth, and the sea of the neighboring city. The Zeus of Sparta is not the same as the Zeus of Athens; in the same oath one sometimes invokes two Athenas or two Apollos. A traveller who would journey through Greece[51] would therefore meet thousands of local gods (they called them Poliades, or gods of the city). No torrent, no wood, no mountain was without its own deity,[52] although often a minor divinity, adored only by the people of the vicinity and whose sanctuary was only a grotto in the rock.

=The Great Gods.=--Above the innumerable legion of local gods of each canton the Greeks imagined certain great divinities--the heaven, the sun, the earth, and the sea--and these everywhere had the same name, and had their temple or sanctuary in every place. Each represented one of the principal forces of nature. These gods common to all the Greeks were never numerous; if all are included, we have hardly twenty.[53] We have the bad habit of calling them by the name of a Latin god. The following are their true names: Zeus (Jupiter), Hera (Juno), Athena (Minerva), Apollo, Artemis (Diana), Hermes (Mercury), Hephaistos (Vulcan), Hestia (Vesta), Ares (Mars), Aphrodite (Venus), Poseidon (Neptune), Amphitrite, Proteus, Kronos (Saturn), Rhea (Cybele), Demeter (Ceres), Persephone (Proserpina), Hades (Pluto), Dionysos (Bacchus). It is this little group of gods that men worshipped

in all the temples, that men ordinarily invoked in their prayers.

=Attributes of the Gods.=--Each of these great gods had his form, his costume, his instruments (which we call his attributes); it is thus that the faithful imagined him and that the sculptors represented him. Each has his character which is well known to his worshippers. Each has his role in the world, performing his determined functions, ordinarily with the aid of secondary divinities who obey him.

Athena, virgin of clear eye, is represented standing, armed with a lance, a helmet on the head, and gleaming armor on the breast. She is the goddess of the clear air, of wisdom, and of invention, a goddess of dignity and majesty.

Hephaistos, the god of fire, is figured with a hammer and in the form of a lame and ugly blacksmith. It is he who forges the thunderbolt.

Artemis, shy maiden, armed with bow and quiver, courses the forests hunting with a troop of nymphs. She is the goddess of the woods, of the chase, and of death.

Hermes, represented with winged sandals, is the god of the fertile showers. But he has other offices; he is the god of streets and squares, the god of commerce, of theft, and of eloquence. He it is who guides the souls of the dead, the messenger of the gods, the deity presiding over the breeding of cattle.

Almost always a Greek god has several functions, quite dissimilar to our eyes, but to the Greeks bearing some relation to one another.

=Olympus and Zeus.=--Each one of these gods is like a king in his own domain. Still the Greeks had remarked that all the forces of nature do not operate by chance and that they act in harmony; the same word served them for the idea of order and of universe. They supposed, then, that the gods were in accord for the administration of the world, and that they, like men, had laws and government among them.

In the north of Greece there was a mountain to whose snowy summit no man had ever climbed. This was Olympus. On this summit, which was hidden by clouds from the eyes of men, it was imagined the gods assembled. Meeting under the light of heaven, they conferred on the affairs of the world. Zeus, the mightiest of them, presided over the gathering: he was god of the heavens and of the light, the god "who masses the clouds," who launches the thunderbolt--an old man of majestic mien, with long beard, sitting on a throne of gold. It is he who commands and the other gods bow before him. Should they essay to resist, Zeus menaces them; Homer makes him say,[54] "Bind to heaven a chain of gold, and all of you, gods or goddesses, throw your weight upon it; all your united efforts cannot draw Zeus, the sovereign ordainer, to the earth. On the contrary, if I wished to draw the chain to myself, I should bring with it the earth and the very sea. Then I would attach it to the summit of Olympus and all the universe would be suspended. By so much am I superior to gods and men."

=Morality of the Greek Mythology.=--The greater part of their gods were conceived by the Greeks as violent, sanguinary, deceitful, dissolute. They ascribed to them scandalous adventures or dishonest acts. Hermes was notorious for his thieving, Aphrodite for her coquetry, Ares for his ferocity. All were so vain as to persecute those who neglected to offer sacrifices to them. Niobe had seen all her children pierced with arrows by Apollo because she herself had boasted of her numerous family. The gods were so jealous that they could not endure seeing a man thoroughly happy; prosperity for the Greeks was the greatest of dangers, for it never failed to draw the anger of the gods, and this anger became a goddess (Nemesis) about whom were told such anecdotes as the following: Once Polycrates of Samos, become very powerful, feared the jealousy of the gods; and so a ring of gold which he still retained was cast into the sea that his good fortune might not be unmixed with evil. Some time after, a fisherman brought to Polycrates an enormous fish and in its belly was found the ring. This was a certain presage of evil. Polycrates was besieged in his city, taken, and crucified. The gods punished him for his good fortune.

Greek mythology was immoral in that the gods gave bad examples to men. The Greek philosophers were already saying this and were inveighing against the poets who had published these stories. A disciple of Pythagoras affirmed that his master, descending to hell, had seen the soul of Homer hanging to a tree and that of Hesiod bound to a column to punish them for calumniating the gods. "Homer and Hesiod," Said Xenophanes, "attribute to the gods all the acts which among men are culpable and shameful; there is but one god who neither in body nor in soul resembles men." And he added this profound remark: "If oxen and lions had hands and could manipulate like men, they would have made gods with bodies similar to their own, horses would have framed gods with horses' bodies, and cattle with cattle's.... Men think that the gods have their feelings, their voice, and their body." Xenophanes

was right; the primitive Greeks had created their gods in their own image. As they were then sanguinary, dissolute, jealous, and vain, their gods were the same. Later, as the people became better, their descendants were shocked with all these vices; but the history and the character of the gods were fixed by the ancient traditions, and later generations, without daring to change them, had received the gross and dishonest gods of their ancestors.

THE HEROES

=The Hero.=--The hero in Greece is a man who has become illustrious, and after death a mighty spirit--not a god, but a demi-god. The heroes do not live on Olympus in the heaven of the gods, they do not direct the life of the world. And yet they, too, possess a power higher than that of any human, and this permits them to aid their friends and destroy their enemies. For this reason the Greeks rendered them worship as to the gods and implored their protection. There was not a city, not a tribe, not a family but had its hero, a protecting spirit which it adored.

=Different Kinds of Heroes.=--Of these heroes many are legendary persons (Achilles, Odysseus, Agamemnon); some without doubt never existed (Herakles, OEdipus); others like Hellen, Dorus, AEolus are only names. But their worshippers regarded them as men of the olden time; and, in fact, the most of the heroes lived at one time. Many are historical personages: generals like Leonidas, Lysander; philosophers like Democritus and Aristotle; legislators like Lycurgus and Solon. The people of Croton adored even one of their fellow-citizens, Philip by name, because he had been in his time the most beautiful man in Greece. The leader who had guided a band of colonists and founded a city became for the inhabitants the Founder; a temple was raised to him and every year sacrifices were offered to him. The Athenian Miltiades was thus worshipped in a city of Thrace. The Spartiate Brasidas, killed in the defence of Amphipolis, had divine honors paid to him in that city, for the inhabitants had come to regard him as their Founder.

=Presence of the Heroes.=--The hero continued to reside in the place where his body was interred, either in his tomb or in the neighborhood. A story told by Herodotus (v. 67) depicts this belief in a lively way. The city of Sicyon adored the hero Adrastus and in a public place was a chapel dedicated to his honor. Cleisthenes, the tyrant of Sicyon, took a fancy to rid himself of this hero. He went to the oracle at Delphi to ask if it would aid him in expelling Adrastus. The oracle replied to his question that Adrastus was king of the Sicyonians and Cleisthenes was a brigand. The tyrant, not daring to evict the hero, adopted a ruse; he sent to Thebes to seek the bones of Melanippus, another hero, and installed them with great pomp in the sanctuary of the city. "He did this," says Herodotus, "because Melanippus during his life had been the greatest enemy of Adrastus and had killed his brother and his son-in-law." Then he transferred to Melanippus the festivals and the sacrifices formerly paid to the honor of Adrastus. He was persuaded, and all the Greeks with him, that the hero would be irritated and would flee.

=Intervention of the Heroes.=--The heroes have divine power; like the gods, they can according to their whim send good or evil. The poet Stesichorus had spoken ill of the famous Helen (that Helen who the legend states was carried away to Troy); he suddenly became blind; when he retracted what he had said, the heroine restored his sight.

The protecting heroes of a city kept it from plagues and famine and even fought against its enemies. At the battle of the Marathon the Athenian soldiers saw in the midst of them Theseus, the mythical founder of Athens, clad in shining armor. During the battle of Salamis the heroes Ajax and Telamon, once kings of Salamis, appeared on the highest point of the island extending their hands to the Greek fleet. "It is not we," said Themistocles, "that have vanquished the Persians; it is the gods and heroes." In "OEdipus at Colonus," a tragedy of Sophocles, OEdipus at the point of death receives the visit of the king of Athens and of the king of Thebes, both of whom as gods request him to have his body interred in their territory, and to become a protecting hero. OEdipus at last consents to be buried in the soil of the Athenians, and says to the king, "Dead, I shall not be a useless inhabitant of this country, I shall be a rampart for you, stronger than millions of warriors." In himself alone a hero was as efficient as a whole army; his spirit was mightier than all living men.

WORSHIP

=Principles of Worship of the Gods.=--Gods and heroes, potent as they were, bestowed on men all good or evil fortune according to their will. It was dangerous to have them against you, wise to have them on your side. They were conceived as like men, irritated if they were neglected, contented if they were venerated. On this principle worship was based. It consisted in doing things agreeable to the gods to obtain their favor. Plato expresses as follows[55] the thought of the common man, "To know how to say and do those things that are pleasing to the gods, either in prayers or in offerings, this is piety which brings prosperity to individuals

and to states. The reverse is impiety which ruins everything." "It is natural," says Xenophon at the end of his treatise on Cavalry, "that the gods should favor those especially who not only consult them in need, but honor them in the day of prosperity." Religion was first of all a contract; the Greek sought to delight the gods and in return required their services. "For a long time," says a priest of Apollo to his god, "I have burned fat bullocks for you; now grant my petitions and discharge your arrows against my enemies."

=The Great Festivals.=--Since the gods had the feelings of men they were to be pleased in the same way as men. Wine, cakes, fruits, food were brought to them. Palaces were built for them. Festivals were given in their honor, for they were "joyous gods" who loved pleasure and beautiful spectacles. A festival was not, as with us, purely an occasion of rejoicing, but a religious ceremony. On those days free from the daily toil men were required to rejoice in public before the god. The Greek, without doubt, delighted in these fetes; but it is for the god and not for himself that he celebrates them. "The Ionians," says an ancient hymn to Apollo, "delight thee with trial of strength, the hymn, and the dance."

=The Sacred Games.=--From these diversions offered to the gods originated the solemn games. Each city had them to the honor of its gods; ordinarily only its citizens were admitted to them; but in four districts of Greece were celebrated games at which all Greeks could be present and participate. These are called the Four Great Games.

The principal of these four festivals was that at Olympia. This was given every four years in honor of Zeus and continued five or six days. The multitude coming from all parts of Greece filled the amphitheatre. They commenced by sacrificing victims and addressing prayers to Zeus and the other gods. Then came the contests; they were:

The foot-race around the stadion.

The Pentathlon, so called because it comprised five exercises. The competitors were to leap, run from one end of the stadion to the other, make a long throw of the metal discus, hurl the javelin, and wrestle.

Boxing, in which one fought with arms bound with thongs of hide.

The chariot races, which were held in the hippodrome; the cars were light and were drawn by four horses.

The judges of the games were clothed in purple, crowned with laurel. After the combat a herald proclaimed before the whole assembly the name of the victor and of his city. A crown of olive was the only reward given him; but his fellow-citizens on his return received him as a conquering hero; sometimes they threw down a section of the city wall to give him entrance. He arrived in a chariot drawn by four horses, clothed in purple, escorted by all the people. "These victories which we leave today to the athletes of the public shows appeared then the greatest of all. Poets of greatest renown celebrated them; Pindar, the most illustrious lyric poet of antiquity, has hardly done more than sing of chariot races. It is related that a certain Diagoras, who had seen his two sons crowned on the same day, was borne in triumph by them in the sight of the spectators. The people, holding such an honor too great for a mortal, cried out, 'Perish, Diagoras, for after all you cannot become a god.' Diagoras, suffocated with emotion, died in the arms of his sons. In his eyes and the eyes of the Greeks the fact that his sons possessed the stoutest fists and the nimblest limbs in Greece was the acme of earthly happiness."[56] The Greeks had their reasons for thus admiring physical prowess: in their wars in which they fought hand to hand the most vigorous athletes were the best soldiers.

=Omens.=--In return for so much homage, so many festivals and offerings, the Greeks expected no small amount of service from their gods. The gods protected their worshippers, gave them health, riches, victory. They preserved them from the evils that menaced them, sending signs which men interpreted. These are called Omens. "When a city," says Herodotus,[57] "is about to suffer some great misfortune, this is usually anticipated by signs. The people of Chios had omens of their defeat: of a band of one hundred youths sent to Delphi but two returned; the others had died of the plague. About the same time the roof of a school of the city fell on the children who were learning to read; but one escaped of the one hundred and twenty. Such were the anticipating signs sent them by the deity."

The Greeks regarded as supernatural signs, dreams, the flight of birds in the heavens, the entrails of animals sacrificed--in a word, everything that they saw, from the tremblings of the earth and eclipses to a simple sneeze. In the expedition to Sicily, Nicias, the general of the Athenians, at the moment of embarking his army for the retreat, was arrested by an eclipse of the moon; the gods, thought he, had sent this prodigy to warn the Athenians not to continue their enterprise. And so Nicias waited; he waited twenty-seven days offering sacrifices to appease the gods. During this inactivity the enemy closed the port, destroyed the fleet, and exterminated his army. The Athenians on learning this news found but one thing with which to reproach Nicias: he should have known that for an army in retreat the eclipse of the moon was a favorable sign. During the retreat of the Ten Thousand, Xenophon,

the general, making an address to his soldiers, uttered this sentiment: "With the help of the gods we have the surest hope that we shall save ourselves with glory." At this point a soldier sneezed. At once all adored the god who had sent this omen. "Since at the very instant when we are deliberating concerning our safety," exclaimed Xenophon, "Zeus the savior has sent us an omen, let us with one consent offer sacrifices to him."[58]

=The Oracles.=--Often the god replies to the faithful who consult him not by a mute sign, but by the mouth of an inspired person. The faithful enter the sanctuary of the god seeking responses and counsel. These are Oracles.

There were oracles in many places in Greece and Asia. The most noted were at Dodona in Epirus, and at Delphi, at the foot of Mount Parnassus. At Dodona it was Zeus who spoke by the rustling of the sacred oaks. At Delphi it was Apollo who was consulted. Below his temple, in a grotto, a current of cool air issued from a rift in the ground. This air the Greeks thought[59] was sent by the god, for he threw into a frenzy those who inhaled it. A tripod was placed over the orifice, a woman (the Pythia), prepared by a bath in the sacred spring, took her seat on the tripod, and received the inspiration. At once, seized with a nervous frenzy, she uttered cries and broken sentences. Priests sitting about her caught these expressions, set them to verse, and brought them to him who sought advice of the god.

The oracles of the Pythia were often obscure and ambiguous. When Croesus asked if he should make war on the Persians, the reply was, "Croesus will destroy a great empire." In fact, a great empire was destroyed, but it was that of Croesus.

The Spartans had great confidence in the Pythia, and never initiated an expedition without consulting her. The other Greeks imitated them, and Delphi thus became a sort of national oracle.

=Amphictyonies.=--To protect the sanctuary of Delphi twelve of the principal peoples of Greece had formed an association called an Amphictyony.[60] Every year deputies from these peoples assembled at Delphi to celebrate the festival of Apollo and see that the temple was not threatened; for this temple contained immense wealth, a temptation to pillage it. In the sixth century the people of Cirrha, a neighboring city of Delphi, appropriated these treasures.[61] The Amphictyons declared war against them for sacrilege. Cirrha was taken and destroyed, the inhabitants sold as slaves, the territory left fallow. In the fourth century the Amphictyons made war on the Phocidians also who had seized the treasury of Delphi, and on the people of Amphissa who had tilled a field dedicated to Apollo.

Still it is not necessary to believe that the assembly of the Amphictyons ever resembled a Greek senate. It was concerned only with the temple of Apollo, not at all with political affairs. It did not even prevent members of the Amphictyony fighting one another. The oracle and the Amphictyony of Delphi were more potent than the other oracles and the other amphictyonies; but they never united the Greeks into a single nation.

FOOTNOTES:

[51] See the account of the traveller Pausanias.

[52] "There are," says Hesiod, "30,000 gods on the fruitful earth."

[53] Greek scholars formed a select society of twelve gods and goddesses, but their choice was arbitrary, and all did not agree on the same series. The Greeks of different countries and of different epochs often represented the same god under different forms. Further, the majority of the gods seem to us to have vague and undetermined attributes; this is because they were not the same everywhere.

[54] Iliad, viii., 18.

[55] In the dialogue "Eutyphron."

[56] Taine, "Philosophy of Art."

[57] Herodotus, vi., 27

[58] Xenophon, "Anabasis," iii, 2.

[59] This idea gained currency only in the later periods of Grecian history.--ED.

[60] There were similar amphictyonies at Delos, Calauria, and Onchestus.

[61] The special charge against Cirrha was the levying of toll on pilgrims coming to Delphi.--ED.

CHAPTER XI

SPARTA

THE PEOPLE

=Laconia.=--When the Dorian mountaineers invaded the Peloponnesus, the main body of them settled at Sparta in Laconia. Laconia is a narrow valley traversed by a considerable stream (the Eurotas) flowing between two massive mountain ranges with snowy summits. A poet describes the country as follows: "A land rich in tillable soil, but hard to cultivate, deep set among perpendicular mountains, rough in aspect, inaccessible to invasion." In this enclosed country lived the Dorians of Sparta in the midst of the ancient inhabitants who had become, some their subjects, others their serfs. There were, then, in Laconia three classes: Helots, Perioeci, Spartiates.

=The Helots.=--The Helots dwelt in the cottages scattered in the plain and cultivated the soil. But the land did not belong to them--indeed, they were not even free to leave it. They were, like the serfs of the Middle Ages, peasants attached to the soil, from father to son. They labored for a Spartiate proprietor who took from them the greater part of the harvest. The Spartiates instructed them, feared them, and ill treated them. They compelled them to wear rude garments, beat them unreasonably to remind them of their servile condition, and sometimes made them intoxicated to disgust their children with the sight of drunkenness. A Spartiate poet compares the Helots to "loaded asses stumbling under their burdens and the blows inflicted."

=The Perioeci.=--The Perioeci (those who live around) inhabited a hundred villages in the mountains or on the coast. They were sailors, they engaged in commerce, and manufactured the objects necessary to life. They were free and administered the business of their village, but they paid tribute to the magistrates of Sparta and obeyed them.

=Condition of the Spartiates.=--Helots and Perioeci despised the Spartiates, their masters. "Whenever one speaks to them of the Spartiates," says Xenophon,[62] "there isn't one of them who can conceal the pleasure he would feel in eating them alive." Once an earthquake nearly destroyed Sparta: the Helots at once rushed from all sides of the plain to massacre those of the Spartiates who had escaped the catastrophe. At the same time the Perioeci rose and refused obedience. The Spartiates' bearing toward the Perioeci was certain to exasperate them. At the end of a war in which many of the Helots had fought in their army, they bade them choose those who had especially distinguished themselves for bravery, with the promise of freeing them. It was a ruse to discover the most energetic and those most capable of revolting. Two thousand were chosen; they were conducted about the temples with heads crowned as an evidence of their manumission; then the Spartiates put them out of the way, but how it was done no one ever knew.[63]

And yet the oppressed classes were ten times more, numerous than their masters. While there were more than 200,000 Helots and 120,000 Perioeci, there were never more than 9,000 Spartiate heads of families. In a matter of life and death, then, it was necessary that a Spartiate be as good as ten Helots. As the form of battle was hand-to-hand, they needed agile and robust men. Sparta was like a camp without walls; its people was an army always in readiness.

EDUCATION

=The Children.=--They began to make soldiers of them at birth. The newly-born infant was brought before a council; if it was found deformed, it was exposed on the mountain to die; for an army has use only for strong men. The children who were permitted to grow up were taken from their parents at the age of seven years and were trained together as members of a group. Both summer and winter they went bare-foot and had but a single mantle. They lay on a heap of reeds and bathed in the cold waters of the Eurotas. They ate little and that quickly and had a rude diet. This was to teach them not to satiate the stomach. They were grouped by hundreds, each under a chief. Often they had to contend together with blows of feet and fists. At the feast of Artemis they were beaten before the statue of the goddess till the blood flowed; some died under this ordeal, but their honor required them not to weep. They were taught to fight and suffer.

Often they were given nothing to eat; provision must be found by foraging. If they were captured on these predatory expeditions, they were roughly beaten. A Spartiate boy who had stolen a little fox and had hidden it under his mantle, rather than betray himself let the animal gnaw out his vitals. They were to learn how to escape from perplexing situations when they were in the field.

They walked with lowered glance, silent, hands under the mantle, without turning the head and "making no more noise than statues." They were not to speak at table and were to obey all men that they encountered. This was to accustom them to discipline.

=The Girls.=--The other Greeks kept their daughters secluded in the house, spinning flax. The Spartiates would have robust women capable of bearing vigorous children. The girls, therefore, were trained in much the same manner as the boys. In their gymnasia they practised running, leaping, throwing the disc and Javelin. A poet describes a play in which Spartiate girls "like colts with flowing manes make the dust fly about them." They were reputed the healthiest and bravest women in Greece.

=The Discipline.=--The men, too, have their regular life and this a soldier's life. The presence of many enemies requires that no one shall weaken. At seventeen years the Spartiate becomes a soldier and this he until he is sixty. The costume, hour of rising and retiring, meals, exercise--everything is fixed by regulations as in barracks.

Since the Spartiate engages only in war, he is to prepare himself for that; he exercises himself in running, leaping, and wielding his arms; he disciplines all the members of the body--the neck, the arms, the shoulders, the legs, and that too, every day. He has no right to engage in trade, to pursue an industry, nor to cultivate the earth; he is a soldier and is not to allow himself to be diverted to any other occupation. He cannot live at his pleasure with his own family; the men eat together in squads; they cannot leave the country without permission. It is the discipline of a regiment in the enemy's territory.

=Laconism.=--These warriors had a rude life, with clean-cut aims and proud disposition. They spoke in short phrases--or as we say, laconically--the word has still persisted. The Greeks cited many examples of these expressions. To a garrison in danger of being surprised the government sent this message, "Attention!" A Spartan army was summoned by the king of Persia to lay down his arms; the general replied, "Come and take them." When Lysander captured Athens, he wrote simply, "Athens is fallen."

=Music. The Dance.=--The arts of Sparta were those that pertained to an army. The Dorian conquerors brought with them a peculiar sort of music--the Dorian style, serious, strong, even harsh. It was military music; the Spartiates went into battle to the sound of the flute so that the step might be regular.

Their dance was a military movement. In the "Pyrrhic" the dancers were armed and imitated all the movements of a battle; they made the gestures of striking, of parrying, of retreating, and of throwing the javelin.

=Heroism of the Women.=--The women stimulated the men to combat; their exhibitions of courage were celebrated in Greece, so much so that collections of stories of them were made.[64] A Spartan mother, seeing her son fleeing from battle, killed him with her own hand, saying; "The Eurotas does not flow for deer." Another, learning that her five sons had perished, said, "This is not what I wish to know; does victory belong to Sparta?" "Yes." "Then let us render thanks to the gods."

THE INSTITUTIONS OF SPARTA

=The Kings and the Council.=--The Spartiates had at first, like the other Greeks, an assembly of the people. All these institutions were preserved, but only in form. The kings, descendants of the god Herakles, were loaded with honors; they were given the first place at the feasts and were served with a double portion; when they died all the inhabitants made lamentation for them. But no power was left to them and they were closely watched.

The Senate was composed of twenty-eight old men taken from the rich and ancient families, appointed for life; but it did not govern.

=The Ephors.=--The real masters of Sparta were the Ephors (the name signifies overseers), five magistrates who were renewed every year. They decided peace and war, and had judicial functions; when the king commanded the army, they accompanied him, directed the operations, and sometimes made him return. Usually they consulted the senators and took action in harmony with them. Then they assembled the Spartiates in one place, announced to them what had been decided and asked their approbation. The people without discussing the matter approved the action by acclamation. No one knew whether he had the right to refuse assent; accustomed to obey, the Spartiate never refused. It was, therefore, an aristocracy of governing families. Sparta was not a country of equality. There were some men who were called Equals, but only because they were equal among themselves. The others were termed Inferiors and had no part in the government.

=The Army.=--Thanks to this regime, the Spartiates preserved the rude customs of mountaineers; they had no sculptors, no architects, no orators, no philosophers. They had sacrificed everything to war; they became "adepts in the military art,"[65] and instructors of the other Greeks. They introduced two innovations especially: a better method of combat, a better method of athletic exercise.

=The Hoplites.=--Before them the Greeks marched into battle in disorder; the chiefs, on horseback or in a light chair, rushed ahead, the men following on foot, armed each in his own fashion, helter-skelter, incapable of acting together or of resisting. A battle reduced itself to a series of duels and to a massacre. At Sparta all the soldiers had the same arms; for defence, the breastplate covering the chest, the casque which protected the head, the greaves over the legs, the buckler held before the body. For offence the soldier had a short sword and a long lance. The man thus armed was called a hoplite. The Spartan hoplites were drawn up in regiments, battalions, companies, squads, almost like our armies. An officer commanded each of these groups and transmitted to his men the orders of his superior officer, so that the general in chief might have the same movement executed throughout the whole army. This organization which appears so simple to us was to the Greeks an astonishing novelty.

=The Phalanx.=--Come into the presence of the enemy, the soldiers arrange themselves in line, ordinarily eight ranks deep, each man close to his neighbor, forming a compact mass which we call a Phalanx. The king, who directs the army, sacrifices a goat to the gods; if the entrails of the victim are propitious, he raises a chant which all the army takes up in unison. Then they advance. With rapid and measured step, to the sound of the flute, with lance couched and buckler before the body, they meet the enemy in dense array, overwhelm him by their mass and momentum, throw him into rout, and only check themselves to avoid breaking the phalanx. So long as they remain together each is protected by his neighbor and all form an impenetrable mass on which the enemy could secure no hold. These were rude tactics, but sufficient to overcome a disorderly troop. Isolated men could not resist such a body. The other Greeks understood this, and all, as far as they were able, imitated the Spartans; everywhere men were armed as hoplites and fought in phalanx.

=Gymnastics.=--To rush in orderly array on the enemy and stand the shock of battle there was need of agile and robust men; every man had to be an athlete. The Spartans therefore organized athletic exercises, and in this the other Greeks imitated them; gymnastics became for all a national art, the highest esteemed of all the arts, the crowning feature of the great festivals.

In the most remote countries, in the midst of the barbarians of Gaul or of the Black Sea, a Greek city was recognized by its gymnasium. There was a great square surrounded by porticoes or walks, usually near a spring, with baths and halls for exercise. The citizens came hither to walk and chat: it was a place of association. All the young men entered the gymnasium; for two years or less they came here every day; they learned to leap, to run, to throw the disc and the javelin, to wrestle by seizing about the waist. To harden the muscles and strengthen the skin they plunged into cold water, dispensed with oil for the body, and rubbed the flesh with a scraper (the strigil).

=Athletes.=--Many continued these exercises all their lives as a point of honor and became Athletes. Some became marvels of skill. Milo of Croton in Italy, it was said, would carry a bull on his shoulders; he stopped a chariot in its course by seizing it from behind. These athletes served sometimes in combats as soldiers, or as generals. Gymnastics were the school of war.

=Role of the Spartiates.=--The Spartans taught the other Greeks to exercise and to fight. They always remained the most vigorous wrestlers and the best soldiers, and were recognized as such by the rest of Greece. Everywhere they were respected. When the rest of the Greeks had to fight together against the Persians, they unhesitatingly took the Spartans as chiefs--and with justice, said an Athenian orator.

CHAPTER XII

ATHENS

THE ATHENIAN PEOPLE

=Attica.=--The Athenians boasted of having always lived in the same country; their ancestors, according to their story, originated from the soil itself. The mountaineers who conquered the south land passed by the country without invading it; Attica was hardly a

temptation to them.

Attica is composed of a mass of rocks which in the form of a triangle advances into the sea. These rocks, renowned for their blocks of marble and for the honey of their bees,[66] are bare and sterile. Between them and the sea are left three small plains with meagre soil, meanly watered (the streams are dry in summer) and incapable of supporting a numerous population.

=Athens.=--In the largest of these plains, a league from the sea, rises a massive isolated rock: Athens was built at its foot. The old city, called the Acropolis, occupied the summit of the rock.

The inhabitants of Attica commenced, not by forming a single state, but by founding scattered villages, each of which had its own king and its own government. Later all these villages united under one king,[67] the king of Athens, and established a single city. This does not mean that all the people came to dwell in one town. They continued to have their own villages and to cultivate their lands; but all adored one and the same protecting goddess, Athena, divinity of Athens, and all obeyed the same king.

=Athenian Revolutions.=--Later still the kings were suppressed. In their place Athens had nine chiefs (the archons) who changed every year. This whole history is little known to us for no writing of the time is preserved. They used to say that for centuries the Athenians had lived in discord; the nobles (Eupatrids) who were proprietors of the soil oppressed the peasants on their estates; creditors held their debtors as slaves. To reestablish order the Athenians commissioned Solon, a sage, to draft a code of laws for them (594).

Solon made three reforms:

1. He lessened the value of the money, which allowed the debtors to release themselves more easily.

2. He made the peasants proprietors of the land that they cultivated. From this time there were in Attica more small proprietors than in any other part of Greece.

3. He grouped all the citizens into four classes according to their incomes. Each had to pay taxes and to render military service according to his wealth, the poor being exempt from taxation and military service.

After Solon the Athenians were subject to Pisistratus, one of their powerful and clever citizens; but in 510 the dissensions revived.

=Reforms of Cleisthenes.=--Cleisthenes, leader of one of the parties, used the occasion to make a thoroughgoing revolution.

There were many strangers in Athens, especially seamen and traders who lived in Piraeus near the harbor. Cleisthenes gave them the rights of citizenship and made them equal[68] to the older inhabitants. From this time there were two populations side by side--the people of Attica and those of Piraeus. A difference of physical features was apparent for three centuries afterward: the people of Attica resembled the rest of the Greeks; those in Piraeus resembled Asiatics. The Athenian people thus augmented was a new people, the most active in Greece.

THE ATHENIAN PEOPLE

In the fifth century the society of Athens was definitely formed: three classes inhabited the district of Attica--slaves, foreigners, and citizens.

=The Slaves.=--The slaves constituted the great majority of the population; there was no man so poor that he did not have at least one slave; the rich owned a multitude of them, some as many as five hundred. The larger part of the slaves lived in the house occupied with grinding grain, kneading bread, spinning and weaving cloth, performing the service of the kitchens, and in attendance on their masters. Others labored in the shops as blacksmiths, as dyers, or in stone quarries or silver mines. Their master fed them but sold at a profit everything which they produced, giving them in return nothing but their living. All the domestic servants, all the miners, and the greater part of the artisans were slaves. These men lived in society but without any part in it; they had not even the disposition of their own bodies, being wholly the property of other men. They were thought of only as objects of property; they were often referred to as "a body" ({~GREEK SMALL LETTER SIGMA~}{~GREEK SMALL LETTER OMEGA~}{~GREEK SMALL LETTER MU~}{~GREEK SMALL LETTER ALPHA~}). There was no other law for them than the will of their master, and he had all power over them--to make them work, to imprison them, to deprive them of their sustenance, to beat them. When a citizen went to law, his adversary had the right to require that the former's slaves should be put to the torture to tell what they knew. Many Athenian orators commend this usage as an ingenious means for obtaining true testimony. "Torture," says the orator Isaeus, "is the

surest means of proof; and so when you wish to clear up a contested question, you do not address yourselves to freemen, but, placing the slaves to the torture, you seek to discover the truth."

=Foreigners.=--The name Metics was applied to people of foreign origin who were established in Athens. To become a citizen of Athens it was not enough, as with us, to be born in the country; one must be the son of a citizen. It might be that some aliens had resided in Attica for several generations and yet their family not become Athenian. The metics could take no part in the government, could not marry a citizen, nor acquire land. But they were personally free, they had the right of commerce by sea, of banking and of trade on condition that they take a patron to represent them in the courts. There were in Athens more than ten thousand families of metics, the majority of them bankers or merchants.

=The Citizens.=--To be a citizen of Athens it was necessary that both parents should be citizens. The young Athenian, come to maturity at about eighteen years of age, appeared before the popular assembly, received the arms which he was to bear and took the following oath: "I swear never to dishonor these sacred arms, not to quit my post, to obey the magistrates and the laws, to honor the religion of my country." He became simultaneously citizen and soldier. Thereafter he owed military service until he was sixty years of age. With this he had the right to sit in the assembly and to fulfil the functions of the state.

Once in a while the Athenians consented to receive into the citizenship a man who was not the son of a citizen, but this was rare and a sign of great favor. The assembly had to vote the stranger into its membership, and then nine days after six thousand citizens had to vote for him on a secret ballot. The Athenian people was like a closed circle; no new members were admitted except those pleasing to the old members, and they admitted few beside their sons.

THE GOVERNMENT OF ATHENS

=The Assembly.=--The Athenians called their government a democracy (a government by the people). But this people was not, as with us, the mass of inhabitants, but the body of citizens, a true aristocracy of 15,000 to 20,000 men who governed the whole nation as masters. This body had absolute power, and was the true sovereign of Athens. It assembled at least three times a month to deliberate and to vote. The assembly was held in the open air on the Pnyx; the citizens sat on stone benches arranged in an amphitheatre; the magistrates before them on a platform opened the session with a religious ceremony and a prayer, then a herald proclaimed in a loud voice the business which was to occupy the assembly, and said, "Who wishes to speak?" Every citizen had the right to this privilege; the orators mounted the tribune according to age. When all had spoken, the president put the question; the assembly voted by a show of hands, and then dissolved.

=The Courts.=--The people itself, being sovereign, passed judgment in the courts. Every citizen of thirty years of age could participate in the judicial assembly (the Heliaea). The heliasts sat in the great halls in sections of five hundred; the tribunal was, then, composed of one thousand to fifteen hundred judges. The Athenians had no prosecuting officer as we have; a citizen took upon himself to make the accusation. The accused and the accuser appeared before the court; each delivered a plea which was not to exceed the time marked off by a water-clock. Then the judges voted by depositing a black or white stone. If the accuser did not obtain a certain number of votes, he himself was condemned.

=The Magistrates.=--The sovereign people needed a council to prepare the business for discussion and magistrates to execute their decisions. The council was composed of five hundred citizens drawn by lot for one year. The magistrates were very numerous: ten generals to command the army, thirty officials for financial administration, sixty police officials to superintend the streets, the markets, weights and measures, etc.[69]

=Character of This Government.=--The power in Athens did not pertain to the rich and the noble, as in Sparta. In the assembly everything was decided by a majority of votes and all the votes were equal. All the jurors, all the members of the council, all the magistrates except the generals were chosen by lot. The citizens were equal not only in theory, but also in practice. Socrates said[70] to a well-informed Athenian who did not dare to speak before the people: "Of what are you afraid? Is it of the fullers, the shoe-makers, the masons, the artisans, or the merchants? for the assembly is composed of all these people."

Many of these people had to ply their trade in order to make a living, and could not serve the state gratuitously; and so a salary was instituted: every citizen who sat in the assembly or in the courts received for every day of session three obols (about eight cents of our money), a sum just sufficient to maintain life at that time. From this day the poor administered the government.

=The Demagogues.=--Since all important affairs whether in the assembly or in the courts were decided by discussion and discourse, the influential men were those who knew how to speak best. The people accustomed themselves to listen to the orators,

to follow their counsels, to charge them with embassies, and even to appoint them generals. These men were called Demagogues (leaders of the people). The party of the rich scoffed at them: in a comedy Aristophanes represents the people (Demos) under the form of an old man who has lost his wits: "You are foolishly credulous, you let flatterers and intriguers pull you around by the nose and you are enraptured when they harangue you." And the chorus, addressing a charlatan, says to him, "You are rude, vicious; you have a strong voice, an impudent eloquence, and violent gestures; believe me, you have all that is necessary to govern Athens."

PRIVATE LIFE

The Athenians created so many political functions that a part of the citizens was engaged in fulfilling them. The citizen of Athens, like the functionary or soldier of our days, was absorbed in public affairs. Warring and governing were the whole of his life. He spent his days in the assembly, in the courts, in the army, at the gymnasium, or at the market. Almost always he had a wife and children, for his religion commanded this, but he did not live at home.

=The Children.=--When a child came into the world, the father had the right to reject it. In this case it was laid outside the house where it died from neglect, unless a passer-by took it and brought it up as a slave. In this custom Athens followed all the Greeks. It was especially the girls that were exposed to death. "A son," says a writer of comedy, "is always raised even if the parents are in the last stage of misery; a daughter is exposed even though the parents are rich."

If the father accepted the child, the latter entered the family. He was left at first in the women's apartments with the mother. The girls remained there until the day of their marriage; the boys came out when they were seven years old. The boy was then entrusted to a preceptor (pedagogue), whose business it was to teach him to conduct himself well and to obey. The pedagogue was often a slave, but the father gave him the right to beat his son. This was the general usage in antiquity.

Later the boy went to school, where he learned to read, write, cipher, recite poetry, and to sing in the chorus or to the sound of the flute. At last came gymnastics. This was the whole of the instruction; it made men sound in body and calm in spirit--what the Greeks called "good and beautiful."

To the young girl, secluded with her mother, nothing of the liberal arts was taught; it was thought sufficient if she learned to obey. Xenophon represents a rich and well-educated Athenian speaking thus of his wife with Socrates: "She was hardly twenty years old when I married her, and up to that time she had been subjected to an exacting surveillance; they had no desire that she should live, and she learned almost nothing. Was it not enough that one should find in her a woman who could spin the flax to make garments, and who had learned how to distribute duties to the slaves?" When her husband proposed that she become his assistant, she replied with great surprise, "In what can I aid you? Of what am I capable? My mother has always taught me that my business was to be prudent." Prudence or obedience was the virtue which was required of the Greek woman.

=Marriage.=--At the age of fifteen the girl married. The parents had chosen the husband; it might be a man from a neighboring family, or a man who had been a long-time friend of the father, but always a citizen of Athens. It was rare that the young girl knew him; she was never consulted in the case. Herodotus, speaking of a Greek, adds: "This Callias deserves mention for his conduct toward his daughters; for when they were of marriageable age he gave them a rich dowry, permitted them to choose husbands from all the people, and he then married them to the men of their choice."

=Athenian Women.=--In the inner recess of the Athenian house there was a retired apartment reserved for the women--the Gynecaeum. Husband and relatives were the only visitors; the mistress of the household remained here all day with her slaves; she directed them, superintended the house-keeping, and distributed to them the flax for them to spin. She herself was engaged with weaving garments. She left the house seldom save for the religious festivals. She never appeared in the society of men: "No one certainly would venture," says the orator Isaeus, "to dine with a married woman; married women do not go out to dine with men or permit themselves to eat with strangers." An Athenian woman who frequented society could not maintain a good reputation.

The wife, thus secluded and ignorant, was not an agreeable companion. The husband had taken her not for his life-long companion, but to keep his house in order, to be the mother of his children, and because Greek custom and religion required that he should marry. Plato says that one does not marry because he wants to, but "because the law constrains him." And the comic poet Menander had found this saying: "Marriage, to tell the truth, is an evil, but a necessary evil." And so the women in Athens, as in most of the other states of Greece, always held but little place in society.

CHAPTER XIII

WARS OF THE GREEKS

THE PERSIAN WARS

=Origin of the Persian Wars.=--While the Greeks were completing the organization of their cities, the Persian king was uniting all the nations of the East in a single empire. Greeks and Orientals at length found themselves face to face. It is in Asia Minor that they first meet.

On the coast of Asia Minor there were rich and populous colonies of the Greeks;[71] Cyrus, the king of Persia, desired to subject them. These cities sent for help to the Spartans, who were reputed the bravest of the Greeks, and this action was reported to Cyrus; he replied,[72] "I have never feared this sort of people that has in the midst of the city a place where the people assemble to deceive one another with false oaths." (He was thinking of the market-place.) The Greeks of Asia were subdued and made subject to the Great King.

Thirty years later King Darius found himself in the presence of the Greeks of Europe. But this time it was the Greeks that attacked the Great King. The Athenians sent twenty galleys to aid the revolting Ionians; their soldiers entered Lydia, took Sardis by surprise and burned it. Darius revenged himself by destroying the Greek cities of Asia, but he did not forget the Greeks of Europe. He had decreed, they say, that at every meal an officer should repeat to him: "Master, remember the Athenians." He sent to the Greek cities to demand earth and water, a symbol in use among the Persians to indicate submission to the Great King. Most of the Greeks were afraid and yielded. But the Spartans cast the envoys into a pit, bidding them take thence earth and water to carry to the king. This was the beginning of the Median wars.

=Comparison of the Two Adversaries.=--The contrast between the two worlds which now entered into conflict is well marked by Herodotus[73] in the form of a conversation of King Xerxes with Demaratus, a Spartan exile: "'I venture to assure you,' said Demaratus, 'that the Spartans will offer you battle even if all the rest of the Greeks fight on your side, and if their army should not amount to more than one thousand men.' 'What!' said Xerxes, 'one thousand men attack so immense an army as mine! I fear your words are only boasting; for although they be five thousand, we are more than one thousand to one. If they had a master like us, fear would inspire them with courage; they would march under the lash against a larger army; but being free and independent, they will have no more courage than that with which nature has endowed them.' 'The Spartans,' replied Demaratus, 'are not inferior to anybody in a hand-to-hand contest, and united in a phalanx they are the bravest of all men. Yet, though free, they have an absolute master, the Law, which they dread more than all your subjects do you; they obey it, and this law requires them to stand fast to their post and conquer or die.'" This is the difference between the two parties to the conflict: on the one side, a multitude of subjects united by force under a capricious master; on the other, little martial republics whose citizens govern themselves according to laws which they respect.

=First Persian War.=--There were two Persian wars. The first was simply an expedition against Athens; six hundred galleys sent by Darius disembarked a Persian army on the little plain of Marathon, seven hours distant from Athens.

Religious sentiment prevented the Spartans from taking the field before the full moon, and it was still only the first quarter; the Athenians had to fight alone.[74] Ten thousand citizens armed as hoplites camped before the Persians. The Athenians had ten generals, having the command on successive days; of these Miltiades, when his turn came, drew up the army for battle. The Athenians charged the enemy in serried ranks, but the Persians seeing them advancing without cavalry and without archers, thought them fools. It was the first time that the Greeks had dared to face the Persians in battle array. The Athenians began by turning both flanks, and then engaged the centre, driving the Persians in disorder to the sea and forcing them to reembark on their ships.

The victory of Marathon delivered the Athenians and made them famous in all Greece (490).

=Second Persian War.=--The second war began ten years later with an invasion. Xerxes united all the peoples of the empire, so that the land force amounted, as some say, to 1,700,000 men.[75] There were Medes and Persians clad in sleeved tunics, armed with cuirasses of iron, bucklers, bows and arrows; Assyrians with cuirass of linen, armed with clubs pointed with iron; Indians clad in cotton with bows and arrows of bamboo; savages of Ethiopia with leopard skins for clothing; nomads armed only with lassos; Phrygians armed with short pikes; Lydians equipped like Greeks; Thracians carrying javelins and daggers. The enumeration of these fills twenty chapters in Herodotus.[76] These warriors brought with them a crowd equally numerous of non-combatants, of servants, slaves, women, together with a mass of mules, horses, camels, and baggage wagons.

This horde crossed the Hellespont by a bridge of boats in the spring of 480. For seven days and nights it defiled under the lash. Then traversing Thrace, it marched on Greece, conquering the peoples whom it met.

The Persian fleet, 1,200 galleys strong, coasted the shores of Thrace, passing through the canal at Mount Athos which Xerxes had had built for this very purpose.

The Greeks, terrified, submitted for the most part to the Great King and joined their armies to the Persian force. The Athenians sent to consult the oracle of Delphi, but received only the reply; "Athens will be destroyed from base to summit." The god being asked to give a more favorable response, replied, "Zeus accords to Pallas [protectress of Athens] a wall of wood which alone shall not be taken; in that shall you and your children find safety." The priests of whom they asked the interpretation of this oracle bade the Athenians quit Attica and go to establish themselves elsewhere. But Themistocles explained the "wall of wood" as meaning the ships; they should retire to the fleet and fight the Persians on sea.

Athens and Sparta, having decided on resistance, endeavored to form a league of the Greeks against the Persians. Few cities had the courage to enter it, and these placed themselves under the command of the Spartans. Four battles in one year settled the war. At Thermopylae, Leonidas, king of Sparta, who tried to bar the entrance to a defile was outflanked and overwhelmed. At Salamis, the Persian fleet, crowded into a narrow space where the ships embarrassed one another, was defeated by the Greek navy (480). At Plataea the rest of the Persian army left in Greece was annihilated by the Greek hoplites; of 300,000 men but 40,000 escaped. The same day at Mycale, on the coast of Asia, an army of the Greeks landed and routed the Persians (479). The Greeks had conquered the Great King.

=Reasons for the Greek Victory.=--The Median war was not a national war between Greeks and barbarians. All the Greeks of Asia and half the Greeks of Europe fought on the Persian side. Many of the other Greeks gave no assistance. In reality it was a fight of the Great King and his subjects against Sparta, Athens, and their allies.

The conquest of this great horde by two small peoples appeared at that time as a prodigy. The gods, said the Greeks, had fought for them. But there is less wonder when we examine the two antagonists more closely: the Persian army was innumerable, and Xerxes had thought that victory was a matter of numbers. But this multitude was an embarrassment to itself. It did not know where to secure food for itself, it advanced but slowly, and it choked itself on the day of combat. Likewise the ships arranged in too close order drove their prows into neighboring ships and shattered their oars. Then in this immense crowd there were, according to Herodotus, many men but few soldiers. Only the Persians and Medes, the flower of the army, fought with energy; the rest advanced only under the lash, they had come under pressure to a war which had no interest for them, ill-armed and without discipline, ready to desert as soon as no one was watching them. At Plataea the Medes and Persians were the only ones to do any fighting; the subjects kept aloof.

The Persian soldiers were ill-equipped; they were embarrassed by their long robes, the head was poorly protected by a felt hat, the body ill-defended by a shield of wicker-work. For arms they had a bow, a dagger, and a very short pike; they could fight only at a great distance or hand-to-hand. The Spartans and their allies, on the contrary, secure in the protection of great buckler, helmet and greaves, marched in solid line and were irresistible; they broke the enemy with their long pikes and at once the battle became a massacre.

=Results of the Persian Wars.=--Sparta had commanded the troops, but as Herodotus says,[77] it was Athens who had delivered Greece by setting an example of resistance and constituting the fleet of Salamis. It was Athens who profited by the victory. All the Ionian cities of the Archipelago and of the coast of Asia revolted and formed a league against the Persians. The Spartans, men of the mountains, could not conduct a maritime war, and so withdrew; the Athenians immediately became chiefs of the league. In

476[78] Aristides, commanding the fleet, assembled the delegates of the confederate cities. They decided to continue the war against the Great King, and engaged to provide ships and warriors and to pay each year a contribution of 460 talents ($350,000). The treasure was deposited at Delos in the temple of Apollo, god of the Ionians. Athens was charged with the leadership of the military force and with collecting the tax. To make the agreement irrevocable Aristides had a mass of hot iron cast into the sea, and all swore to maintain the oaths until the day that the iron should mount to the surface.

A day came, however, when the war ceased, and the Greeks, always the victors, concluded a peace, or at least a truce,[79] with the Great King. He surrendered his claim on the Asiatic Greeks (about 449).

What was to become of the treaty of Aristides? Were the confederate cities still to pay their contribution now that there was no more fighting? Some refused it even before the war was done. Athens asserted that the cities had made their engagements in perpetuity and forced them to pay them.

The war finished, the treasury at Delos had no further use; the Athenians transferred the money to Athens and used it in building their monuments. They maintained that the allies paid for deliverance from the Persians; they, therefore, had no claim against Athens so long as she defended them from the Great King. The allies had now become the tributaries of Athens: they were now her subjects. Athens increased the tax on them, and required their citizens to bring their cases before the Athenian courts; she even sent colonists to seize a part of their lands. Athens, mistress of the league, was sovereign over more than three hundred cities spread over the islands and the coasts of the Archipelago, and the tribute paid her amounted to six hundred talents a year.

STRIFE AMONG THE GREEK STATES

=The Peloponnesian War.=--After the foundation of the Athenian empire in the Archipelago the Greeks found themselves divided between two leagues--the maritime cities were subject to Athens; the cities of the interior remained under the domination of Sparta. After much preliminary friction war arose between Sparta and her continental allies on the one side and Athens and her maritime subjects on the other. This was the _Peloponnesian War_. It continued twenty-seven years (431-404), and when it ceased, it was revived under other names down to 360.

These wars were complicated affairs. They were fought simultaneously on land and sea, in Greece, Asia, Thrace, and Sicily, ordinarily at several points at once. The Spartans had a better army and ravaged Attica; the Athenians had a superior fleet and made descents on the coasts of the Peloponnesus. Then Athens sent its army to Sicily where it perished to the last man (413); Lysander, a Spartan general, secured a fleet from the Persians and destroyed the Athenian fleet in Asia (405). The Athenian allies who fought only under compulsion abandoned her. Lysander took Athens, demolished its walls, and burnt its ships.

=Wars against Sparta.=--Sparta was for a time mistress on both land and sea. "In those days," says Xenophon, "all cities obeyed when a Spartan issued his orders." But soon the allies of Sparta, wearied of her domination, formed a league against her. The Spartans, driven at first from Asia, still maintained their power in Greece for some years by virtue of their alliance with the king of the Persians (387). But the Thebans, having developed a strong army under the command of Epaminondas, fought them at Leuctra (371) and at Mantinea (362). The allies of Sparta detached themselves from her, but the Thebans could not secure from the rest of the Greeks the recognition of their supremacy. From this time no Greek city was sovereign over the others.

=Savage Character of These Wars.=--These wars between the Greek cities were ferocious. A few incidents suffice to show their character. At the opening of the war the allies of Sparta threw into the sea all the merchants from cities hostile to them. The Athenians in return put to death the ambassadors of Sparta without allowing them to speak a word. The town of Plataea was taken by capitulation, and the Spartans had promised that no one should be punished without a trial; but the Spartan judges demanded of every prisoner if during the war he had rendered any service to the Peloponnesians; when the prisoner replied in the negative, he was condemned to death. The women were sold as slaves. The city of Mitylene having revolted from Athens was retaken by her. The Athenians in an assembly deliberated and decreed that all the people of Mitylene should be put to death. It is true that the next day the Athenians revised the decree and sent a second ship to carry a more favorable commission, but still more than one thousand Mityleneans were executed.

After the Syracusan disaster all the Athenian army was taken captive. The conquerors began by slaughtering all the generals and many of the soldiers. The remainder were consigned to the quarries which served as prison. They were left there crowded together for seventy days, exposed without protection to the burning sun of summer, and then to the chilly nights of autumn. Many died from sickness, from cold and hunger--for they were hardly fed at all; their corpses remained on the ground and infected the air. At last

the Syracusans drew out the survivors sold them into slavery.

Ordinarily when an army invaded a hostile state it levelled the houses, felled the trees, burned the crops and killed the laborers. After battle it made short shrift of the wounded and killed prisoners in cold blood. In a captured city everything belonged to the captor: men, women, children were sold as slaves. Such was at this time the right of war. Thucydides sums up the case as follows:[80] "Business is regulated between men by the laws of justice when there is obligation on both sides; but the stronger does whatever is in his power, and the weaker yields. The gods rule by a necessity of their nature because they are strongest; men do likewise."

=Results of These Wars.=--These wars did not result in uniting the Greeks into one body. No city, Sparta more than Athens, was able to force the others to obey her. They only exhausted themselves by fighting one another. It was the king of Persia who profited by the strife. Not only did the Greek cities not unite against him, but all in succession allied themselves with him against the other Greeks. In the notorious Peace of Antalcidas (387) the Great King declared that all the Greek cities of Asia belonged to him, and Sparta recognized this claim. Athens and Thebes did as much some years later. An Athenian orator said, "It is the king of Persia who governs Greece; he needs only to establish governors in our cities. Is it not he who directs everything among us? Do we not summon the Great King as if we were his slaves?" The Greeks by their strife had lost the vantage that the Median war had gained for them.

CHAPTER XIV

THE ARTS IN GREECE

ATHENS AT THE TIME OF PERICLES

=Pericles.=--In the middle of the fifth century Athens found herself the most powerful city in Greece. Pericles, descended from one of the noble families, was then the director of the affairs of the state. He wasted neither speech nor personality, and never sought to flatter the vanity of the people. But the Athenians respected him and acted only in accordance with his counsels; they had faith in his knowledge of all the details of administration, of the resources of the state, and so they permitted him to govern. For forty years Pericles was the soul of the politics of Athens; as Thucydides his contemporary said, "The democracy existed in name; in reality it was the government of the first citizen."

=Athens and Her Monuments.=--In Athens, as in the majority of Greek cities, the houses of individuals were small, low, packed closely together, forming narrow streets, tortuous and ill paved. The Athenians reserved their display for their public monuments. Ever after they levied heavy war taxes on their allies they had large sums of money to expend, and these were employed in erecting beautiful edifices. In the market-place they built a portico adorned with paintings (the Poikile), in the city a theatre, a temple in honor of Theseus, and the Odeon for the contests in music. But the most beautiful monuments rose on the rock of the Acropolis

as on a gigantic pedestal. There were two temples of which the principal, the Parthenon, was dedicated to Athena, protecting goddess of the city; a colossal statue of bronze which represented Athena; and a staircase of ornamental character leading up to the Propylaea. Athens was from this time the most beautiful of the Greek cities.[81]

=Importance of Athens.=--Athens became at the same time the city of artists. Poets, orators, architects, painters, sculptors--some Athenians by birth, others come from all corners of the Greek world--met here and produced their masterpieces. There were without doubt many Greek artists elsewhere than at Athens; there had been before the fifth century, and there were a long time afterward; but never were so many assembled at one time in the same city. Most of the Greeks had fine sensibilities in matters of art; but the Athenians more than all others had a refined taste, a cultivated spirit and love of the beautiful. If the Greeks have gained renown in the history of civilization, it is that they have been a people of artists; neither their little states nor their small armies have played a great role in the world. This is why the fifth century is the most beautiful moment in the history of Greece; this is why Athens has remained renowned above all the rest of the Greek cities.

LETTERS

=The Orators.=--Athens is above all the city of eloquence. Speeches in the assembly determine war, peace, taxes, all state business of importance; speeches before the courts condemn or acquit citizens and subjects. Power is in the hands of the orators; the people follow their counsels and often commit to them important public functions: Cleon is appointed general; Demosthenes directs the war against Philip.

The orators have influence; they employ their talents in eloquence to accuse their political enemies. Often they possess riches, for they are paid for supporting one party or the other: AEschines is retained by the king of Macedon; Demosthenes accepts fees from the king of Persia.

Some of the orators, instead of delivering their own orations, wrote speeches for others. When an Athenian citizen had a case at court, he did not desire, as we do, that an advocate plead his case for him; the law required that each speak in person. He therefore sought an orator and had him compose a speech which he learned by heart and recited before the tribunal.

Other orators travelled through the cities of Greece speaking on subjects which pleased their fancy. Sometimes they gave lectures, as we should say.

The oldest orators spoke simply, limiting themselves to an account of the facts without oratorical flourishes; on the platform they were almost rigid without loud speaking or gesticulation. Pericles delivered his orations with a calm air, so quietly, indeed, that no fold of his mantle was disturbed. When he appeared at the tribune, his head, according to custom, crowned with leaves, he might have been taken, said the people, "for a god of Olympus." But the orators who followed wished to move the public. They assumed an animated style, pacing the tribune in a declamatory and agitated manner. The people became accustomed to this form of eloquence. The first time that Demosthenes came to the tribune the assembly shouted with laughter; the orator could not enunciate, he carried himself ill. He disciplined himself in declamation and gesture and became the favorite of the people. Later when he was asked what was the first quality of the orator, he replied, "Action, and the second, action, and the third, action." Action, that is delivery, was more to the Greeks than the sense of the discourse.

=The Sages.=--For some centuries there had been, especially among the Greeks of Asia, men who observed and reflected on things. They were called by a name which signifies at once wise men and scholars. They busied themselves with physics, astronomy, natural history, for as yet science was not separated from philosophy. Such were in the seventh century the celebrated Seven Sages of Greece.

=The Sophists.=--About the time of Pericles there came to Athens men who professed to teach wisdom. They gathered many pupils and charged fees for their lessons. Ordinarily they attacked the religion, customs, and institutions of Greek cities, showing that they were not founded on reason. They concluded that men could not know anything with certainty (which was quite true for their time), that men can know nothing at all, and that nothing is true or false: "Nothing exists," said one of them, "and if it did exist, we could not know it." These professors of scepticism were called sophists. Some of them were at the same time orators.

=Socrates and the Philosophers.=--Socrates, an old man of Athens, undertook to combat the sophists. He was a poor man, ugly, and without eloquence. He opened no school like the sophists but contented himself with going about the city, conversing with those he met, and leading them by the force of his questions to discover what he himself had in mind. He sought especially the young men and gave them instruction and counsel. Socrates made no pretensions as a scholar: "All my knowledge," said he, "is to

know that I know nothing." He would call himself no longer a sage, like the others, but a philosopher, that is to say, a lover of wisdom. He did not meditate on the nature of the world nor on the sciences; man was his only interest. His motto was, "Know thyself." He was before all a preacher of virtue.

As he always spoke of morals and religion, the Athenians took him for a sophist.[82] In 399 he was brought before the court, accused "of not worshipping the gods of the city, of introducing new gods, and of corrupting the youth." He made no attempt to defend himself, and was condemned to death. He was then seventy years old.

Xenophon, one of his disciples, wrote out his conversations and an apology for him.[83] Another disciple, Plato, composed dialogues in which Socrates is always the principal personage. Since this time Socrates has been regarded as the "father of philosophy." Plato himself was the head of a school (429-348); Aristotle (384-322), a disciple of Plato, summarized in his books all the science of his time. The philosophers that followed attached themselves to one or the other of these two masters: the disciples of Plato called themselves Academicians,[84] those of Aristotle, Peripatetics.[85]

=The Chorus.=--It was an ancient custom of the Greeks to dance in their religious ceremonies. Around the altar dedicated to the god a group of young men passed and repassed, assuming noble and expressive attitudes, for the ancients danced with the whole body. Their dance, very different from ours, was a sort of animated procession, something like a solemn pantomime. Almost always this religious dance was accompanied by chants in honor of the god. The group singing and dancing at the same time was called the Chorus. All the cities had their festival choruses in which the children of the noblest families participated after long time of preparation. The god required the service of a troop worthy of him.

=Tragedy and Comedy.=--In the level country about Athens the young men celebrated in this manner each year religious dances in honor of Dionysos, the god of the vintage. One of these dances was grave; it represented the actions of the god. The leader of the chorus played Dionysos, the chorus itself the satyrs, his companions. Little by little they came to represent also the life of the other gods and the ancient heroes. Then some one (the Greeks call him Thespis) conceived the idea of setting up a stage on which the actor could play while the chorus rested. The spectacle thus perfected was transferred to the city near the black poplar tree in the market. Thus originated Tragedy.

The other dance was comic. The masked dancers chanted the praises of Dionysos mingled with jeers addressed to the spectators or with humorous reflections on the events of the day. The same was done for the comic chorus as for the tragic chorus: actors were introduced, a dialogue, all of a piece, and the spectacle was transferred to Athens. This was the origin of Comedy. This is the reason that from this time tragedy has been engaged with heroes, and comedy with every-day life.

Tragedy and comedy preserved some traces of their origin. Even when they were represented in the theatre, they continued to be played before the altar of the god. Even after the actors mounted on the platform had become the most important personages of the spectacle, the choir continued to dance and to chant around the altar. In the comedies, like the masques in other days, sarcastic remarks on the government came to be made; this was the Parabasis.

=The Theatre.=--That all the Athenians might be present at these spectacles there was built on the side of the Acropolis the theatre of Dionysos which could hold 30,000 spectators. Like all the Greek theatres, it was open to heaven and was composed of tiers of rock ranged in a half-circle about the orchestra where the chorus performed and before the stage where the play was given.

Plays were produced only at the time of the festivals of the god, but then they continued for several days in succession. They began in the morning at sunrise and occupied all the time till torch-light with the production of a series of three tragedies (a trilogy) followed by a satirical drama. Each trilogy was the work of one author. Other trilogies were presented on succeeding days, so that the spectacle was a competition between poets, the public determining the victor. The most celebrated of these competitors were AEschylus, Sophocles, and Euripides. There were also contests in comedy, but there remain to us only the works of one comic poet, Aristophanes.

THE ARTS

=Greek Temples.=--In Greece the most beautiful edifices were constructed to the honor of the gods, and when we speak of Greek architecture it is their temples that we have in mind.

A Greek temple is not, like a Christian church, designed to receive the faithful who come thither to pray. It is the palace[86] where the god lives, represented by his idol, a palace which men feel under compulsion to make splendid. The mass of the faithful do not

enter the interior of the temple; they remain without, surrounding the altar in the open air.

At the centre of the temple is the "chamber" of the god, a mysterious sanctuary without windows, dimly lighted from above.[87] On the pavement rises the idol of wood, of marble, or of ivory, clad in gold and adorned with garments and jewels. The statue is often of colossal size; in the temple of Olympia Zeus is represented sitting and his head almost touches the summit of the temple. "If the god should rise," they said, "his head would shatter the roof." This sanctuary, a sort of reliquary for the idol, is concealed on every side from the eyes. To enter, it is necessary to pass through a porch formed by a row of columns.

Behind the "chamber" is the "rear-chamber" in which are kept the valuable property of the god--his riches,[88] and often the gold and silver of the city. The temple is therefore storehouse, treasury, and museum.

Rows of columns surround the building on four sides, like a second wall protecting the god and his treasures. There are three orders of columns which differ in base and capital, each bearing the name of the people that invented it or most frequently used it. They are, in the order of age, the Doric, the Ionic, and the Corinthian. The temple is named from the style of the columns supporting it.

Above the columns, around the edifice are sculptured surfaces of marble (the metopes) which alternate with plain blocks of marble (the triglyphs). Metopes and triglyphs constitute the frieze.

The temple is surmounted with a triangular pediment adorned with statues.

Greek temples were polychrome, that is to say, were painted in several colors, yellow, blue, and red. For a long time the moderns refused to believe this; it was thought that the Greeks possessed too sober taste to add color to an edifice. But traces of painting have been discovered on several temples, which cannot leave the matter in doubt. It has at last been concluded, on reflection, that these bright colors were to give a clearer setting to the lines.

=Characteristics of Greek Architecture.=--A Greek temple appears at first a simple, bare edifice; it is only a long box of stone set upon a rock; the facade is a square surmounted by a triangle. At first glance one sees only straight lines and cylinders. But on nearer inspection "it is discovered[89] that not a single one of these lines is truly straight." The columns swell at the middle, vertical lines are slightly inclined to the centre, and horizontal lines bulge a little at the middle. And all this is so fine that exact measurements are necessary to detect the artifice. Greek architects discovered that, to produce a harmonious whole, it is necessary to avoid geometrical lines which would appear stiff, and take account of illusions in perspective. "The aim of the architect," says a Greek writer, "is to invent processes for deluding the sight."

Greek artists wrought conscientiously for they worked for the gods. And so their monuments are elaborated in all their parts, even in those that are least in view, and are constructed so solidly that they exist to this day if they have not been violently destroyed. The Parthenon was still intact in the seventeenth century. An explosion of gunpowder wrecked it.

The architecture of the Greeks was at once solid and elegant, simple and scientific. Their temples have almost all disappeared; here and there are a very few,[90] wholly useless, in ruins, with roofs fallen in, often nothing left but rows of columns. And yet, even in this state, they enrapture those who behold them.

=Sculpture.=--Among the Egyptians and the Assyrians sculpture was hardly more than an accessory ornament of their edifices; the Greeks made it the principal art. Their most renowned artists, Phidias, Praxiteles, and Lysippus, were sculptors.

They executed bas-reliefs to adorn the walls of a temple, its facade or its pediment. Of this style of work is the famous frieze of the Panathenaic procession which was carved around the Parthenon, representing young Athenian women on the day of the great festival of the goddess.[91]

They sculptured statues for the most part, of which some represented gods and served as idols; others represented athletes victorious in the great games, and these were the recompense of his victory.

The most ancient statues of the Greeks are stiff and rude, quite similar to the Assyrian sculptures. They are often colored. Little by little they become graceful and elegant. The greatest works are those of Phidias in the fifth century and of Praxiteles in the fourth. The statues of the following centuries are more graceful, but less noble and less powerful.

There were thousands of statues in Greece,[92] for every city had its own, and the sculptors produced without cessation for five centuries. Of all this multitude there remain to us hardly fifteen complete statues. Not a single example of the masterpieces

celebrated among the Greeks has come down to us. Our most famous Greek statues are either copies, like the Venus of Milo, or works of the period of the decadence, like the Apollo of the Belvidere.[93] Still there remains enough, uniting the fragments of statues and of bas-reliefs which are continually being discovered,[94] to give us a general conception of Greek sculpture.

Greek sculptors sought above everything else to represent the most beautiful bodies in a calm and noble attitude. They had a thousand occasions for viewing beautiful bodies of men in beautiful poses, at the gymnasium, in the army, in the sacred dances and choruses. They studied them and learned to reproduce them; no one has ever better executed the human body.

Usually in a Greek statue the head is small, the face without emotion and dull. The Greeks did not seek, as we do, the expression of the face; they strove for beauty of line and did not sacrifice the limbs for the head. In a Greek statue it is the whole body that is beautiful.

=Pottery.=--The Greeks came to make pottery a real art. They called it Ceramics (the potter's art), and this name is still preserved. Pottery had not the same esteem in Greece as the other arts, but for us it has the great advantage of being better known than the others. While temples and statues fell into ruin, the achievements of Greek potters are preserved in the tombs. This is where they are found today. Already more than 20,000 specimens have been collected in all the museums of Europe. They are of two sorts:

1. Painted vases, with black or red figures, of all sizes and every form;

2. Statuettes of baked earth; hardly known twenty years ago, they have now attained almost to celebrity since the discovery of the charming figurines of Tanagra in Boeotia. The most of them are little idols, but some represent children or women.

=Painting.=--There were illustrious painters in Greece--Zeuxis, Parrhasius, and Apelles. We know little of them beyond some anecdotes, often doubtful, and some descriptions of pictures. To obtain an impression of Greek painting we are limited to the frescoes found in the houses of Pompeii, an Italian city of the first century of our era. This amounts to the same as saying we know nothing of it.

FOOTNOTES:

[81] The moderns have called this time the Age of Pericles, because Pericles was then governing and was the friend of many of these artists; but the ancients never employed the phrase.

[82] See Aristophanes' "Clouds."

[83] The "Memorabilia" and "Apologia."

[84] Because Plato had lectured in the gardens of a certain Academus.

[85] Because Aristotle had given instruction while moving about. [Or rather from a favorite walk (Peripatus) in the Lyceum.--ED.]

[86] The Greek word for temple signifies "dwelling."

[87] But not by a square opening in the roof as formerly supposed.--ED. See Gardner, "Ancient Athens," N.Y., 1902, p. 268.

[88] The Parthenon contained vases of gold and silver, a crown of gold, shields, helmets, swords, serpents of gold, an ivory table, eighteen couches, and quivers of ivory.

[89] Boutmy, "Philosophie de l'Architecture en Grece."

[90] The most noted are the Parthenon at Athens and the temple of Poseidon at Paestum, in south Italy.

[91] Knights and other subjects were also shown.--ED.

[92] Even in the second century after the Romans had pillaged Greece to adorn their palaces, there were many thousands of statues in the Greek cities.

[93] It is not certain that the Apollo Belvidere was not a Roman copy.

[94] In the ruins of Olympia has been found a statue of Hermes, the work of Praxiteles.

CHAPTER XV

THE GREEKS IN THE ORIENT

ASIA BEFORE ALEXANDER

=Decadence of the Persian Empire.=--The Greeks, engaged in strife, ceased to attack the Great King; they even received their orders from him. But the Persian empire still continued to become enfeebled. The satraps no longer obeyed the government; each had his court, his treasure, his army, made war according to his fancy, and in short, became a little king in his province. When the Great King desired to remove a satrap, he had scarcely any way of doing it except by assassinating him. The Persians themselves were no longer that nation before which all the Asiatic peoples were wont to tremble. Xenophon, a Greek captain, who had been in their pay, describes them as follows: "They recline on tapestries wearing gloves and furs. The nobles, for the sake of the pay, transform their porters, their bakers, and cooks into knights--even the valets who served them at table, dressed them or perfumed them. And so, although their armies were large, they were of no service, as is apparent from the fact that their enemies traversed the empire more freely than their friends. They no longer dared to fight. The infantry as formerly was equipped with buckler, sword, and axe, but they had no courage to use them. The drivers of chariots before facing the enemy basely allowed themselves to be overthrown at once or leaped down from the cars, so that these being no longer under control injured the Persians more than the enemy. For the rest, the Persians do not disguise their military weakness, they concede their inferiority and do not dare to take the field except there are Greeks in their army. They have for their maxim 'never to fight Greeks without Greek auxiliaries on their side.'"

=Expedition of the Ten Thousand.=--This weakness was very apparent when in 400 Cyrus, brother of the Great King Artaxerxes, marched against him to secure his throne. There were then some thousands of adventurers or Greek exiles who hired themselves as mercenaries. Cyrus retained ten thousand of them. Xenophon, one of their number, has written the story of their expedition.

This army crossed the whole of Asia even to the Euphrates without resistance from any one.[95] They at last came to battle near Babylon. The Greeks according to their habit broke into a run, raising the war-cry. The barbarians took flight before the Greeks had come even within bow-shot. The Greeks followed in pursuit urging one another to keep ranks.

When the war-chariots attacked them, they opened their ranks and let them through. Not a Greek received the least stroke with the exception of one only who was wounded with an arrow. Cyrus was killed; his army disbanded without fighting, and the Greeks remained alone in the heart of a hostile country threatened by a large army. And yet the Persians did not dare to attack them, but treacherously killed their five generals, twenty captains, and two hundred soldiers who had come to conclude a truce.

The friendless mercenaries elected new chiefs, burned their tents and their chariots, and began their retreat. They broke into the rugged mountains of Armenia, and notwithstanding famine, snow, and the arrows of the natives who did not wish to let them pass, they came to the Black Sea and returned to Greece after traversing the whole Persian empire. At their return (399) their number amounted still to 8,000.

=Agesilaus.=--Three years after, Agesilaus, king of Sparta, with a small army invaded the rich country of Asia Minor, Lydia, and Phrygia. He fought the satraps and was about to invade Asia when the Spartans ordered his return to fight the armies of Thebes and Athens. Agesilaus was the first of the Greeks to dream of conquering Persia. He was distressed to see the Greeks fighting among themselves. When they announced to him the victory at Corinth where but eight Spartans had perished and 10,000 of the enemy, instead of rejoicing he sighed and said, "Alas, unhappy Greece, to have lost enough men to have subjugated all the barbarians!" He refused one day to destroy a Greek city. "If we exterminate all the Greeks who fail of their duty," said he, "where shall we find the men to vanquish the barbarians?" This feeling was rare at that time. In relating these words of Agesilaus Xenophon, his biographer, exclaims, "Who else regarded it as a misfortune to conquer when he was making war on peoples of his own race?"

CONQUEST OF ASIA BY ALEXANDER

=Macedon.=--Sparta and Athens, exhausted by a century of wars, had abandoned the contest against the king of Persia. A new people resumed it and brought it to an end; these were the Macedonians. They were a very rude people, crude, similar to the ancient Dorians, a people of shepherds and soldiers. They lived far to the north of Greece in two great valleys that opened to the sea. The Greeks had little regard for them, rating them as half barbarians; but since the kings of Macedon called themselves sons of Herakles they had been permitted to run their horses in the races of the Olympian games. This gave them standing as Greeks.

=Philip of Macedon.=--These kings ruling in the interior, remote from the sea, had had but little part in the wars of the Greeks. But in 359 B.C. Philip ascended the throne of Macedon, a man young, active, bold, and ambitious. Philip had three aims:

1. To develop a strong army;

2. To conquer all the ports on the coast of Macedon;

3. To force all the other Greeks to unite under his command against the Persians.

He consumed twenty-four years in fulfilling these purposes and succeeded in all. The Greeks let him alone, often even aided him; in every city he bribed partisans who spoke in his favor. "No fortress is impregnable," said he, "if only one can introduce within it a mule laden with gold." And by these means he took one after another all the cities of northern Greece.

=Demosthenes.=--The most illustrious opponent of Philip was the orator Demosthenes. The son of an armorer, he was left an orphan at the age of seven, and his guardians had embezzled a part of his fortune. As soon as he gained his majority he entered a case against them and compelled them to restore the property. He studied the orations of Isaeus and the history of Thucydides which he knew by heart. But when he spoke at the public tribune he was received with shouts of laughter; his voice was too feeble and his breath too short. For several years he labored to discipline his voice. It is said that he shut himself up for months with head half shaved that he might not be tempted to go out, that he declaimed with pebbles in his mouth, and on the sea-shore, in order that his voice might rise above the uproar of the crowd. When he reappeared on the tribune, he was master of his voice, and, as he preserved the habit of carefully preparing all his orations, he became the most finished and most potent orator of Greece.

The party that then governed Athens, whose chief was Phocion, wished to maintain the peace: Athens had neither soldiers nor money enough to withstand the king of Macedon. "I should counsel you to make war," said Phocion, "when you are ready for it." Demosthenes, however, misunderstood Philip, whom he regarded as a barbarian; he placed himself at the service of the party that wished to make war on him and employed all his eloquence to move the Athenians from their policy of peace. For fifteen years he seized every occasion to incite them to war; many of his speeches have no other object than an attack on Philip. He himself called these Philippics, and there are three of them. (The name Olynthiacs has been applied to the orations delivered with the purpose of enlisting the Athenians in the aid of Olynthus when it was besieged by Philip.) The first Philippic is in 352. "When, then, O Athenians, will you be about your duty? Will you always roam about the public places asking one of another: What is the news? Ah! How can there be anything newer than the sight of a Macedonian conquering Athens and dominating Greece? I say, then, that you ought to equip fifty galleys and resolve, if necessary, to man them yourselves. Do not talk to me of an army of 10,000 or of 20,000 aliens that exists only on paper. I would have only citizen soldiers."

In the third Philippic (341) Demosthenes calls to the minds of the Athenians the progress made by Philip, thanks to their inaction. "When the Greeks once abused their power to oppress others, all Greece rose to prevent this injustice; and yet today we suffer an unworthy Macedonian, a barbarian of a hated race, to destroy Greek cities, celebrate the Pythian games, or have them celebrated by his slaves. And the Greeks look on without doing anything, just as one sees hail falling while he prays that it may not touch him. You let increase his power without taking a step to stop it, each regarding it as so much time gained when he is destroying another, instead of planning and working for the safety of Greece, when everybody knows that the disaster will end with the inclusion of the most remote."

At last, when Philip had taken Elatea on the borders of Boeotia, the Athenians, on the advice of Demosthenes, determined to make war and to send envoys to Thebes. Demosthenes was at the head of the embassy; he met at Thebes an envoy come from Philip; the Thebans hesitated. Demosthenes besought them to bury the old enmities and to think only of the safety of Greece, to defend its honor and its history. He persuaded them to an alliance with Athens and to undertake the war. A battle was fought at Chaeronea in Boeotia, Demosthenes, then at the age of forty-eight, serving as a private hostile. But the army of the Athenians and Thebans, levied in haste, was not equal to the veterans of Philip and was thrown into rout.

=The Macedonian Supremacy.=--Philip, victorious at Chaeronea, placed a garrison in Thebes and offered peace to Athens. He then entered the Peloponnesus and was received as a liberator among the peoples whom Sparta had oppressed. From this time he met with no resistance. He came to Corinth and assembled delegates from all the Greek states (337)[96] except Sparta.

Here Philip published his project of leading a Greek army to the invasion of Persia. The delegates approved the proposition and made a general confederation of all the Greek states. Each city was to govern itself and to live at peace with its neighbors. A general council was initiated to prevent wars, civil dissensions, proscriptions, and confiscations.

This confederacy made an alliance with the king of Macedon and conferred on him the command of all the Greek troops and navies. Every Greek was prohibited making war on Philip on pain of banishment.

=Alexander.=--Philip of Macedon was assassinated in 336. His son Alexander was then twenty years old. Like all the Greeks of good family he was accustomed to athletic exercises, a vigorous fighter, an excellent horseman (he alone had been able to master Bucephalus, his war-horse). But at the same time he was informed in politics, in eloquence, and in natural history, having had as teacher from his thirteenth to his seventeenth year Aristotle, the greatest scholar of Greece. He read the Iliad with avidity, called this the guide to the military art, and desired to imitate its heroes. He was truly born to conquer, for he loved to fight and was ambitious to distinguish himself. His father said to him, "Macedon is too small to contain you."

=The Phalanx.=--Philip left a powerful instrument of conquest, the Macedonian army, the best that Greece had seen. It comprised the phalanx of infantry and a corps of cavalry.

The phalanx of Macedonians was formed of 16,000 men ranged with 1,000 in front and 16 men deep. Each had a sarissa, a spear about twenty feet in length. On the field of battle the Macedonians, instead of marching on the enemy facing all in the same direction, held themselves in position and presented their pikes to the enemy on all sides, those in the rear couching their spears above the heads of the men of the forward ranks. The phalanx resembled "a monstrous beast bristling with iron," against which the enemy was to throw itself. While the phalanx guarded the field of battle, Alexander charged the enemy at the head of his cavalry. This Macedonian cavalry was a distinguished body formed of young nobles.

=Departure of Alexander.=--Alexander started in the spring of 334 with 30,000 infantry (the greater part of these Macedonians) and 4,500 knights; he carried only seventy talents (less than eighty thousand dollars) and supplies for forty days. He had to combat not only the crowd of ill-armed peoples such as Xerxes had brought together, but an army of 50,000 Greeks enrolled in the service of the Great King under a competent general, Memnon of Rhodes. These Greeks might have withstood the invasion of Alexander, but Memnon died and his army dispersed. Alexander, delivered from his only dangerous opponent, conquered the Persian empire in two years.

=Victories of Granicus, Issus, and Arbela.=--Three victories gave the empire to Alexander. In Asia Minor he overthrew the Persian troops stationed behind the river Granicus (May, 333). At Issus, in the ravines of Cilicia, he routed King Darius and his army of 600,000 men (November, 333). At Arbela, near the Tigris, he scattered and massacred a still more numerous army (331).

This was a repetition of the Median wars. The Persian army was ill equipped and knew nothing of manoeuvring; it was embarrassed with its mass of soldiers, valets, and baggage. The picked troops alone gave battle, the rest were scattered and massacred. Between the battles the conquest was only a triumphal progress. Nobody resisted (except the city of Tyre, commercial rival of the Greeks); what cared the peoples of the empire whether they were subject to Darius or Alexander? Each victory gave Alexander the whole of the country: the Granicus opened Asia Minor, Issus Syria and Egypt, Arbela the rest of the empire.

=Death of Alexander.=--Master now of the Persian empire Alexander regarded himself as the heir of the Great King. He assumed Persian dress, adopted the ceremonies of the Persian court and compelled his Greek generals to prostrate themselves before him according to Persian usage. He married a woman of the land and united eighty of his officers to daughters of the Persian nobles. He aimed to extend his empire to the farthest limits of the ancient kings and advanced even to India, warring with the combative natives. After his return with his army to Babylon (324), he died at the age of thirty-three, succumbing to a fever of brief duration (323).

=Projects of Alexander.=--It is very difficult to know exactly what Alexander's purposes were. Did he conquer for the mere pleasure of it? Or did he have a plan? Did he wish to fuse into one all the peoples of his empire? Was he following the example already set him by Persia? Or did he, perhaps, imitate the Great King simply for vain-glory? And so of his intentions we know nothing. But his acts had great results. He founded seventy cities--many Alexandrias in Egypt, in Tartary, and even in India. He distributed to his subjects the treasures that had been uselessly hoarded in the chests of the Great King. He stimulated Greek scholars to study the plants, the animals, and the geography of Asia. But what is of special importance, he prepared the peoples of the Orient to receive the language and customs of the Greeks. This is why the title "Great" has been assigned to Alexander.

THE HELLENES IN THE ORIENT

=Dissolution of the Empire of Alexander.=--Alexander had united under one master all the ancient world from the Adriatic to the Indus, from Egypt to the Caucasus. This vast empire endured only while he lived. Soon after his death his generals disputed as to who should succeed him; they made war on one another for twenty years, at first under the pretext of supporting some one of the house of Alexander--his brother, his son, his mother, his sisters or one of his wives, later openly in their own names.

Each had on his side a part of the Macedonian army or some of the Greek mercenary soldiers. The Greeks were thus contending among themselves who should possess Asia. The inhabitants were indifferent in these wars as they had been in the strife between the Greeks and the Persians. When the war ceased, there remained but three generals; from the empire of Alexander each of them had carved for himself a great kingdom: Ptolemy had Egypt, Seleucus Syria, Lysimachus Macedonia. Other smaller kingdoms were already separated or detached themselves later: in Europe Epirus; in Asia Minor, Pontus, Bithynia, Galatia, Cappadocia, Pergamos; in Persia, Bactriana and Parthia. Thus the empire of Alexander was dismembered.

=The Hellenistic Kingdoms.=--In these new kingdoms the king was a Greek; accustomed to speak Greek, to adore the Greek gods, and to live in Greek fashion, he preserved his language, his religion, and his customs. His subjects were Asiatics, that is to say, barbarians; but he sought to maintain a Greek court about him; he recruited his army with Greek mercenaries, his administrative officers were Greeks, he invited to his court Greek poets, scholars, and artists.

Already in the time of the Persian kings there were many Greeks in the empire as colonists, merchants, and especially soldiers. The Greek kings attracted still more of these. They came in such numbers that at last the natives adopted the costume, the religion, the manners, and even the language of the Greeks. The Orient ceased to be Asiatic, and became Hellenic. The Romans found here in the first century B.C. only peoples like the Greeks and who spoke Greek.[97]

=Alexandria.=--The Greek kings of Egypt, descendants of Ptolemy,[98] accepted the title of Pharaoh held by the ancient kings, wore the diadem, and, like the earlier sovereigns, had themselves worshipped as children of the Sun. But they surrounded themselves with Greeks and founded their capital on the edge of the sea in a Greek city, Alexandria, a new city established by the order of Alexander.

Built on a simple plan, Alexandria was more regular than other Greek cities. The streets intersected at right angles; a great highway 100 feet broad and three and one-half miles in length traversed the whole length of the city. It was bordered with great monuments--the Stadium where the public games were presented, the Gymnasium, the Museum, and the Arsineum. The harbor was enclosed with a dike nearly a mile long which united the mainland to the island of Pharos. At the very extremity of this island a tower of marble was erected, on the summit of which was maintained a fire always burning to guide the mariners who wished to enter the port. Alexandria superseded the Phoenician cities and became the great port of the entire world.

=The Museum.=--The Museum was an immense edifice of marble connected with the royal palace. The kings of Egypt purposed to make of it a great scientific institution.

The Museum contained a great library.[99] The chief librarian had a commission to buy all the books that he could find. Every book that entered Egypt was brought to the library; copyists transcribed the manuscript and a copy was rendered the owner to indemnify him. Thus they collected 400,000 volumes, an unheard-of number before the invention of printing. Until then the manuscripts of celebrated books were scarce, always in danger of being lost; now it was known where to find them. In the Museum were also a botanical and zooelogical garden, an astronomical observatory, a dissecting room established notwithstanding the prejudices of the Egyptians, and even a chemical laboratory.[100]

The Museum provided lodgings for scholars, mathematicians, astronomers, physicians, and grammarians. They were supported at the expense of the state; often to show his esteem for them the king dined with them. These scholars held conferences and gave lectures. Auditors came from all parts of the Greek world; it was to Alexandria that the youth were sent for instruction. In the city were nearly 14,000 students.

The Museum was at once a library, an academy, and a school--something like a university. This sort of institution, common enough among us, was before that time completely unheard of. Alexandria, thanks to its Museum, became the rendezvous for all the Orientals--Greeks, Egyptians, Jews, and Syrians; each brought there his religion, his philosophy, his science, and all were mingled together. Alexandria became and remained for several centuries the scientific and philosophical capital of the world.

=Pergamum.=--The kingdom of Pergamum in Asia Minor was small and weak. But Pergamum, its capital, was, like Alexandria, a city of artists and of letters. The sculptors of Pergamum constituted a celebrated school in the third century before our era.[101]

Pergamum, like Alexandria, possessed a great library where King Attalus had assembled all the manuscripts of the ancient authors.

It was at Pergamum that, to replace the papyrus on which down to that time they used to write, they invented the art of preparing skins. This new paper of Pergamum was the parchment on which the manuscripts of antiquity have been preserved.

FOOTNOTES:

[95] An episode told by Xenophon shows what fear the Greeks inspired. One day, to make a display before the queen of Cilicia, Cyrus had his Greeks drawn up in battle array. "They all had their brazen helmets, their tunics of purple, their gleaming shields and greaves. The trumpet sounded, and the soldiers, with arms in action, began the charge; hastening their steps and raising the war-cry, they broke into a run. The barbarians were terrified; the Cilician queen fled from her chariot, the merchants of the market abandoning their goods took to flight, and the Greeks returned with laughter to their tents."

[96] There were two assemblies in Corinth--the first in, 338, the second in 337.--ED.

[97] The Gospels and the Acts of the Apostles composed in Asia Minor were written in Greek.

[98] They were called Lagidae from the father of Ptolemy I.

[99] The library of the Museum was burnt during the siege of Alexandria by Caesar. But it had a successor in the Serapeum which contained 300,000 volumes. This is said to have been burnt in the seventh century by the Arabs. [The tale of the destruction of the library under orders of Omar is doubtful.--ED.]

[100] King Ptolemy Philadelphus who had great fear of death passed many years searching for an elixir of life.

[101] There still remain to us some of the statues executed by the orders of King Attalus to commemorate his victory over the Gauls of Asia.

CHAPTER XVI

THE LAST YEARS OF GREECE

DECADENCE OF THE GREEK CITIES

=Rich and Poor.=--In almost all the Greek cities the domains, the shops of trade, the merchant ships, in short, all the sources of financial profit were in the hands of certain rich families. The other families, that is to say, the majority of the citizens,[102] had neither lands nor money. What, then, could a poor citizen do to gain a livelihood? Hire himself as a farmer, an artisan, or a sailor? But the proprietors already had their estates, their workshops, their merchantmen manned by slaves who served them much more cheaply than free laborers, for they fed them ill and did not pay them. Could he work on his own account? But money was very scarce; he could not borrow, since interest was at the rate of ten per cent. Then, too, custom did not permit a citizen to become an artisan. "Trade," said the philosophers, "injures the body, enfeebles the soul and leaves no leisure to engage in public affairs." "And so," says Aristotle, "a well-constituted city ought not to receive the artisan into citizenship." The citizens in Greece constituted a noble class whose only honorable functions, like the nobles of ancient France, were to govern and go to war; working with the hands was degrading. Thus by the competition of slaves and their exalted situation the greater part of the citizens were reduced to extreme misery.

=Social Strife.=--The poor governed the cities and had no means of living. The idea occurred to them to despoil the rich, and the latter, to resist them, organized associations. Then every Greek city was divided into two parties: the rich, called the minority, and the poor, called the majority or the people. Rich and poor hated one another and fought one another. When the poor got the upper hand, they exiled the rich and confiscated their goods; often they even adopted these two radical measures:

1. The abolition of debts;

2. A new partition of lands.

The rich, when they returned to power, exiled the poor. In many cities they took this oath among themselves: "I swear always to be an enemy to the people and to do them all the injury I can."

No means were found of reconciling the two parties: the rich could not persuade themselves to surrender their property; the poor were unwilling to die of hunger. According to Aristotle all revolutions have their origin in the distribution of wealth. "Every civil war," says Polybius, "is initiated to subvert wealth."

They fought savagely, as is always the case between neighbors. "At Miletus the poor were at first predominant and forced the rich to flee the city. But afterwards, regretting that they had not killed them all, they took the children of the exiles, assembled them in barns and had them trodden under the feet of cattle. The rich reentered the city and became masters of it. In their turn they seized the children of the poor, coated them with pitch, and burned them alive."

=Democracy and Oligarchy.=--Each of the two parties--rich and poor--had its favorite form of government and set it in operation when the party held the city. The party of the rich was the Oligarchy which gave the government into the hands of a few people. That of the poor was the Democracy which gave the power to an assembly of the people. Each of the two parties maintained an understanding with the similar party in the other cities. Thus were formed two leagues which divided all the Greek cities: the league of the rich, or Oligarchy, the league of the poor, or Democracy. This regime began during the Peloponnesian War. Athens supported the democratic party, Sparta the oligarchic. The cities in which the poor had the sovereignty allied themselves with Athens; the cities where the rich governed, with Sparta. Thus at Samos when the poor gained supremacy they slew two hundred of the rich, exiled four hundred of them, and confiscated their lands and houses. Samos then adopted a democratic government and allied itself with Athens. The Spartan army came to besiege Samos, bringing with it the rich exiles of Samos who wished to return to the city by force. The city was captured, set up an oligarchy, and joined the league of Sparta.

=The Tyrants.=--At length, the poor perceived that the democratic form of government did not give them strength enough to maintain the contest. In most of the cities they consented to receive a chief. This chief was called Tyrant. He governed as master without obeying any law, condemning to death, and confiscating property at will. Mercenaries defended him against his enemies. The following anecdote represents the policy of the tyrants: "Periander, tyrant of Corinth, sent one day to Thrasybulus, tyrant of Miletus, to ask what conduct he ought to follow in order to govern with safety. Thrasybulus led the envoy into the field end walked with him through the wheat, striking off with his staff all heads that were higher than the others. He sent off the envoy without further advice." The messenger took him for a fool, but Periander understood: Thrasybulus was counselling him to slay the principal citizens.

Everywhere the rich were killed by the tyrant and their goods confiscated; often the wealth was distributed among the poor. This is why the populace always sustained the tyrant.

There were tyrants in Greece from the sixth century; some, like Pisistratus, Polycrates, and Pittacus, were respected for their wisdom. At that time every man was called tyrant who exercised absolute power outside the limits of the constitution; it was not a title of reproach.

But when the tyrants made incessant warfare on the rich they became sanguinary and so were detested. Their situation is depicted in the famous story of Damocles. This Damocles said to Dionysius, tyrant of Syracuse, "You are the happiest of men." "I will show you the delight of being a tyrant," replied Dionysius. He had Damocles served with a sumptuous feast and ordered his servants to show the guest the same honors as to himself. During the feast Damocles raised his eyes and perceived a sword suspended to the ceiling held only by a horse hair, and hanging directly over his head. The comparison was a striking one--the tyrant's life hung only by a thread. The rich, his enemies, watched for an opportunity to cut it, for it was regarded as praiseworthy to assassinate a tyrant. This danger irritated him and made him suspicious and cruel. He dared not trust anybody, believed himself secure only after the massacre of all his enemies, and condemned the citizens to death on the slightest suspicion. Thus the name tyrant became a synonym of injustice.

=Exhaustion of Greece.=--The civil wars between rich and poor continued for nearly three centuries (430-150 B.C.). Many citizens were massacred, a greater number exiled. These exiles wandered about in poverty. Knowing no trade but that of a soldier, they entered as mercenaries into the armies of Sparta, Athens, the Great King, the Persian satraps--in short, of anybody who would hire them. There were 50,000 Greeks in the service of Darius against Alexander. It was seldom that such men returned to their own country.

Thus the cities lost their people. At the same time families became smaller, many men preferring not to marry or raise children, others having but one or two. "Is not this," says Polybius, "the root of the evil, that of these two children war or sickness removes one, then the home becomes deserted and the city enfeebled?" A time came when there were no longer enough citizens in the

towns to resist a conqueror.

THE ROMAN CONQUEST

=The Greek Leagues.=--The most discerning of the Greeks commenced to see the danger during the second war of Rome with Carthage. In an assembly held at Naupactus in 207 B.C. a Greek orator said, "Turn your eyes to the Occident; the Romans and Carthaginians are disputing something else than the possession of Italy. A cloud is forming on that coast, it increases, and impends over Greece."[103]

The Greek cities at this time grouped themselves in two leagues hostile to each other. Two little peoples, the AEtolians and Achaeans, had the direction of them; they commanded the armies and determined on peace and war, just as Athens and Sparta once did. Each league supported in the Greek states one of the two political parties--the AEtolian League the democratic, the Achaean League[104] the oligarchical.

=The Roman Allies.=--Neither of the two leagues was strong enough to unite all the Greek states. The Romans then appeared. Philip, the king of Macedon (197), and later Antiochus,[105] the king of Syria (193-169), made war on them. Both were beaten. Rome destroyed their armies and made them surrender their fleets.

Perseus, the new king of Macedon, was conquered, made prisoner, and his kingdom overthrown (167).[106] The Greeks made no effort to unite for the common defence; rich and poor persisted in their strife, and each hated the other more than the foreigner. The democratic party allied itself with Macedon, the oligarchical party called in the Romans.[107] While the Theban democrats were fighting in the army of Philip, the Theban oligarchs opened the town to the Roman general. At Rhodes all were condemned to death who had acted or spoken against Rome. Even among the Achaeans, Callicrates, a partisan of the Romans, prepared a list of a thousand citizens whom he accused of having been favorable to Perseus; these suspects were sent to Rome where they were held twenty years without trial.

=The Last Fight.=--The Romans were not at first introduced as enemies. In 197 the consul Flamininus, after conquering the king of Macedon, betook himself to the Isthmus of Corinth and before the Greeks assembled to celebrate the games, proclaimed that "all the Greek peoples were free." The crowd in transports of joy approached Flamininus to thank him; they wished to salute their liberator, see his form, touch his hand; crowns and garlands were cast upon him. The pressure upon him was so great that he was nearly suffocated.

The Romans seeing themselves in control soon wished to command. The rich freely recognized their sovereignty; Rome served them by shattering the party of the poor. This endured for forty years. At last in 147, Rome being engaged with Carthage, the democratic party gained the mastery in Greece and declared war on the Romans. A part of the Greeks were panic-stricken; many came before the Roman soldiers denouncing their compatriots and themselves; others betook themselves to a safe distance from the cities; some hurled themselves into wells or over precipices. The leaders of the opposition confiscated the property of the rich, abolished debts, and gave arms to the slaves. It was a desperate contest. Once overcome, the Achaeans reassembled an army and marched to the combat with their wives and children. The general Dioeus shut himself in his house with his whole family and set fire to the building. Corinth had been the centre of the resistance; the Romans entered it, massacred the men, and sold the women and children as slaves. The city full of masterpieces of art was pillaged and burnt; pictures of the great painters were thrown into the dust, Roman soldiers lying on them and playing at dice.

THE HELLENES IN THE OCCIDENT

=Influence of Greece on Rome.=--The Romans at the time of their conquest of the Greeks were still only soldiers, peasants, and merchants; they had no statues, monuments, literature, science, or philosophy. All this was found among the Greeks. Rome sought to imitate these, as the Assyrian conquerors imitated the Chaldeans, as the Persians did the Assyrians. The Romans kept their costume, tongue, and religion, and never confused these with those of the Greeks. But thousands of Greek scholars and artists came to establish themselves in Rome and to open schools of literature and of eloquence. Later it was the fashion for the youth of the great Roman families to go as students to the schools of Athens and Alexandria. Thus the arts and science of the Greeks were gradually introduced into Rome. "Vanquished Greece overcame her savage conqueror," says Horace, the Roman poet; "she brought the arts to uncultured Latium."

=Architecture.=--The Romans had a national architecture. But they borrowed the column from the Greeks and often imitated their buildings. Many Roman temples resemble a Greek temple.

A wealthy Roman's house is composed ordinarily of two parts: the first, the ancient Roman house; the other is only a Greek house added to the first.

=Sculpture.=--The Greeks had thousands of statues, in temples, squares of the city, gymnasia, and in their dwellings. The Romans regarded themselves as the owners of everything that had belonged to the vanquished people. Their generals, therefore, removed a great number of statues, transporting them to the temples and the porticos of Rome. In the triumph of AEmilius Paullus, victor over the king of Macedon (Perseus), a notable spectacle was two hundred and fifty cars full of statues and paintings.

Soon the Romans became accustomed to adorn with statues their theatres, council-halls, and private villas; every great noble wished to have some of them and gave commissions for them to Greek artists. Thus a Roman school of sculpture was developed which continued to imitate ancient Greek models. And so it was Greek sculpture, a little blunted and disfigured, which was spread over all the world subject to the Romans.

=Literature.=--The oldest Latin writer was a Greek, Livius Andronicus, a freedman, a schoolmaster, and later an actor. The first works in Latin were translations from the Greek. Livius Andronicus had translated the Odyssey and several tragedies. The Roman people took pleasure in Greek pieces and would have no others. Even the Roman authors who wrote for the theatre did nothing but translate or arrange Greek tragedies and comedies. Thus the celebrated works of Plautus and of Terence are imitations of the comedies of Menander and of Diphilus, now lost to us.

The Romans imitated also the Greek historians. For a long time it was the fashion to write history, even Roman history, in Greek.

The only great Roman poets declare themselves pupils of the Greeks. Lucretius writes only to expound the philosophy of Epicurus; Catullus imitates the poets of Alexander; Vergil, Theocritus and Homer; Horace translates the odes of the Greek lyrics.

=Epicureans and Stoics.=--The Romans had a practical and literal spirit, very indifferent to pure science and metaphysics. They took interest in Greek philosophy only so far as they believed it had a bearing on morals.

Epicureans and Stoics were two sects of Greek philosophers. The Epicureans maintained that pleasure is the supreme good, not sensual pleasure, but the calm and reasonable pleasure of the temperate man; happiness consists in the quiet enjoyment of a peaceful life, surrounded with friends and without concern for imaginary goods. For the Stoics the supreme good is virtue, which consists in conducting one's self according to reason, with a view to the good of the whole universe. Riches, honor, health, beauty, all the goods of earth are nothing for the wise man; even if one torture him, he remains happy in the possession of the true good.

The Romans took sides for one or the other philosophy, usually without thoroughly comprehending either. Those who passed for Epicureans spent their lives in eating and drinking and even compared themselves to swine. Those calling themselves Stoics, like Cato and Brutus, affected a rude language, a solemn demeanor and emphasized the evils of life. Nevertheless these doctrines, spreading gradually, aided in destroying certain prejudices of the Romans. Epicureans and Stoics were in harmony on two points: they disdained the ancient religion and taught that all men are equal, slaves or citizens, Greeks or barbarians. Their Roman disciples renounced in their school certain old superstitions, and learned to show themselves less cruel to their slaves, less insolent toward other peoples.

The conquest of Greece by the Romans gave the arts, letters, and morals of the Greeks currency in the west, just as the conquest of the Persian empire by the Greeks had carried their language, customs, and religion into the Orient.

FOOTNOTES:

[102] In almost all the Greek cities there was no middle class. In this regard Athens with its thirteen thousand small proprietors is a remarkable exception.

[103] Polybius, v., 104.

[104] The Achaean league had illustrious leaders. In the third century, Aratus, who for twenty-seven years (251-224) traversed Greece, expelling tyrants, recalling the rich and returning to them their property and the government; in the second century Philopoemen, who fought the tyrants of Sparta and died by poison.

[105] There were two kings of Syria by the name of Antiochus, between 193 and 169.--ED.

[106] The decisive battle (Pydna) was fought in 168. Perseus walked in the triumph of Paullus the next year.--ED.

[107] The party policies of the Greeks of this period were hardly so clearly drawn as the above would seem to indicate. Thus the Achaean League allied itself with Macedon against the AEtolians and against Sparta. The AEtolians leagued with the Romans against Macedon.--ED.

CHAPTER XVII

ROME

ANCIENT PEOPLES OF ITALY

THE ETRUSCANS

=Etruria.=--The word Italy never signified for the ancients the same as for us: the Po Valley (Piedmont and Lombardy) was a part of Gaul. The frontier country at the north was Tuscany. The Etruscans who dwelt there have left it their name (Tusci).

Etruria was a country at once warm and humid; the atmosphere hung heavily over the inhabitants. The region on the shore of the sea where the Etruscans had most of their cities is the famous Maremma, a wonderfully fertile area, covered with beautiful forests, but where the water having no outlet forms marshes that poison the air. "In the Maremma," says an Italian proverb, "one gets rich in a year, but dies in six months."

=The Etruscan People.=--The Etruscans were for the ancients, and are still for us, a mysterious people. They had no resemblance to their neighbor's, and doubtless they came from a distance--from Germany, Asia, or from Egypt; all these opinions have been maintained, but no one of them is demonstrated.

We are ignorant even of the language that they spoke. Their alphabet resembles that of the Greeks, but the Etruscan inscriptions present only proper names, and these are too short to furnish a key to the language.

The Etruscans established twelve cities in Tuscany, united in a confederation, each with its own fortress, its king, and its government. They had colonies on both coasts, twelve in Campania in the vicinity of Naples, and twelve more in the valley of the Po.

=Etruscan Tombs.=--There remain to us from the Etruscans only city walls and tombs.

When an Etruscan tomb is opened, one perceives a porch supported by columns and behind this chambers with couches, and bodies laid on these. Round about are ornaments of gold, ivory, and amber; purple cloths, utensils, and especially large painted vases. On the walls are paintings of combats, games, banquets, and fantastic scenes.

=Industry and Commerce.=--The Etruscans knew how to turn their fertile soil to some account, but they were for the most part mariners and traders. Like the Phoenicians they made long journeys to seek the ivory of India, amber from the Baltic, tin, the Phoenician purple, Egyptian jewels adorned with hieroglyphics, and even ostrich eggs. All these objects are found in their tombs. Their navies sailed to the south as far as Sicily. The Greeks hated them and called them "savage Tyrrhenians" or "Etruscan pirates." At this time every mariner on occasion was a pirate, and the Etruscans were especially interested to exclude the Greeks so that they might keep for themselves the trade of the west coast of Italy.

The famous Etruscan vases, which have been taken from the tombs by the thousand to enrich our museums, were imitations of Greek vases, but manufactured by the Etruscans. They represent scenes from Greek mythology, especially the combats about Troy; the human figures are in red on a black ground.

=Religion.=--The Etruscans were a sombre people. Their gods were stern, often malevolent. The two most exalted gods were "the veiled deities," of whom we know nothing. Below these were the gods who hurled the lightning and these form a council of twelve gods. Under the earth, in the abode of the dead, were gods of evil omen. These are represented on the Etruscan vases. The king of the lower world, Mantus, a winged genius, sits with crown on his head and torch in his hand. Other demons armed with sword or club with serpents in their hands receive the souls of the dead; the principal of these under the name Charun (the Charon of the Greeks), an old man of hideous form, bears a heavy mallet to strike his victims. The souls of the dead (the Manes) issue from the

lower world three days in the year, wandering about the earth, terrifying the living and doing them evil. Human victims are offered to appease their lust for blood. The famous gladiatorial combats which the Romans adopted had their origin in bloody sacrifices in honor of the dead.

=The Augurs.=--The Etruscans used to say that a little evil spirit named Tages issued one day from a furrow and revealed to the people assembled the secrets of divination. The Etruscan priests who called themselves haruspices or augurs had rules for predicting the future. They observed the entrails of victims, the thunderbolt, but especially the flight of birds (whence their name "augurs"). The augur at first with face turned to the north, holding a crooked staff in his hand, describes a line which cuts the heavens in two sections; the part to the right is favorable, to the left unfavorable. A second line cutting the first at right angles, and others parallel to these form in the heavens a square which was called the Temple. The augur regarded the birds that flew in this square: some like the eagle have a lucky significance; others like the owl presage evil.

The Etruscans predicted the future destiny of their own people. They are the only people of antiquity who did not expect that they were to persist forever. Etruria, they said, was to endure ten centuries. These centuries were not of exactly one hundred years each, but certain signs marked the end of each period. In the year 44, the year of the death of Caesar, a comet appeared; an Etruscan haruspex stated to the Romans in an assembly of the people that this comet announced the end of the ninth century and the beginning of the tenth, the last of the Etruscan people.

=Influence of the Etruscans.=--The Romans, a semi-barbarous people, always imitated their more civilized neighbors, the Etruscans. They drew from them especially the forms of their religion: the costume of the priests and of the magistrates, the religious rites, and the art of divining the future from birds (the auspices). When the Romans found a city, they observe the Etruscan rites: the founder traces a square enclosure with a plough with share of bronze, drawn by a white bull and a white heifer. Men follow the founder and carefully cast the clods of earth from the side of the furrow. The whole ditch left by the plough is sacred and is not to be crossed. To allow entrance to the enclosure, it is necessary that the founder break the ditch at certain points, and he does this by lifting the plough and carrying it an instant; the interval made in this manner remains profane and it becomes the gate by which one enters. Rome itself was founded according to these rites. It was called Roma Quadrata, and it was said that the founder had killed his brother to punish him for crossing the sacred furrow. Later the limits of Roman colonies and of camps, and even the bounds of domains were always traced in conformity with religious rules and with geometrical lines.

The Roman religion was half Etruscan. The Fathers of the church were right, therefore, in calling Etruria the "Mother of Superstitions."

THE ITALIAN PEOPLE

=Umbrians and Oscans.=--In the rugged mountains of the Apennines, to the east and south of the Roman plain, resided numerous tribes. These peoples did not bear the same name and did not constitute a single nation. They were Umbrians, Sabines, Volscians, AEquians, Hernicans, Marsians, and Samnites. But all spoke almost the same language, worshipped the same gods, and had similar customs. Like the Persians, Hindoos, and Greeks, they were of Aryan race; secluded in their mountains, remote from strangers, they remained like the Aryans of the ancient period; they lived in groups with their herds scattered in the plains; they had no villages nor cities. Fortresses erected on the mountains defended them in time of war. They were brave martial people, of simple and substantial manners. They later constituted the strength of the Roman armies. A proverb ran: "Who could vanquish the Marsians without the Marsians?"

=The Sacred Spring.=--In the midst of a pressing danger, the Sabines, according to a legend, believing their gods to be angry, decided to appease their displeasure by sacrificing to the god of war and of death everything that was born during a certain spring. This sacrifice was called a "Sacred Spring." All the children born in this year belonged to the god. Arrived at the age of manhood, they left the country and journeyed abroad. These exiles formed several groups, each taking for guide one of the sacred animals of Italy, a woodpecker, a wolf, or a bull, and followed it as a messenger of the god. Where the animal halted the band settled itself. Many peoples of Italy, it was said, had originated in these colonies of emigrants and still preserved the name of the animal which had led their ancestors. Such were, the Hirpines (people of the wolf), the Picentines (people of the woodpecker), and the Samnites whose capital was named Bovianum (city of the ox).

=The Samnites.=--The Samnites were the most powerful of all. Settled in the Abruzzi, a paradise for brigands, they descended into the fertile plains of Naples and of Apulia and put Etruscan and Greek towns to ransom.

The Samnites fought against the Romans for two centuries; although always beaten because they had no central administration and no discipline they yet reopened the war. Their last fight was heroic. An old man brought to the chiefs of the army a sacred book written on linen. They formed in the interior of the camp a wall of linen, raised an altar in the midst of it, and around this stood soldiers with unsheathed swords. One by one the bravest of the warriors entered the precinct. They swore not to flee before the enemy and to kill the fugitives. Those who took the oath, to the number of 16,000, donned linen garments. This was the "linen legion"; it engaged in battle, and was slaughtered to the last man.

=The Greeks of Italy.=--All south Italy was covered with Greek colonies, some, like Sybaris, Croton, and Tarentum, very populous and powerful. But the Greeks did not venture on the Roman coast for fear of the Etruscans. Except the city of Cumae the Greek colonies down to the third century had almost no relations with the Romans.

=The Latins.=--The Latins dwelt in the country of hills and ravines to the south of the Tiber, called today the Roman Campagna. They were a small people, their territory comprising no more than one hundred square miles. They were of the same race as the other Italians, similar to them in language, religion, and manners, but slightly more advanced in civilization. They cultivated the soil and built strong cities. They separated themselves into little independent peoples. Each people had its little territory, its city, and its government. This miniature state was called a city. Thirty Latin cities had formed among themselves a religious association analogous to the Greek amphictyonies. Every year they celebrated a common festival, when their delegates, assembled at Alba, sacrificed a bull in honor of their common god, the Latin Jupiter.

=Rome.=--On the frontier of Latium, on the borders of Etruria, in the marshy plain studded with hills that followed the Tiber, rose the city of Rome, the centre of the Roman people scattered in the plain. The land was malarial and dreary; but the situation was good. The Tiber served as a barrier against the enemy from Etruria, the hills were fortresses. The sea was but six leagues away, far enough to escape fear of pirates, and near enough to permit the transportation of merchandise. The port of Ostia at the mouth of the Tiber was a suburb of Rome, as Piraeus was of Athens. The locality was therefore agreeable to a people of soldiers and merchants.

=Roma Quadrata and the Capitol.=--Of the first centuries of Rome we know only some legends, and the Romans knew no more than we. Rome, they said, was a little square town, limited to the Palatine Hill. The founder whom they called Romulus had according to the Etruscan forms traced the circuit with the plough. Every year, on the 21st of April, the Romans celebrated the anniversary of these ceremonies: a procession marched about the primitive enclosure and a priest fixed a nail in a temple in commemoration of it. It was calculated that the founding had occurred in the year 754[108] B.C.

On the other hills facing the Palatine other small cities rose. A band of Sabine mountaineers established themselves on the Capitoline, a group of Etruscan adventurers[109] on Mount Coelius; perhaps there were still other peoples. All these small settlements ended with uniting with Rome on the Palatine. A new wall was built to include the seven hills. The Capitol was then for Rome what the Acropolis was for Athens: here rose the temples of the three protecting deities of the city--Jupiter, Juno, and Minerva, and the citadel that contained the treasure and the archives of the people. In laying the foundations, it was said there was found a human head recently cleft from the body; this head was a presage that Rome should become the head of the world.

FOOTNOTES:

[108] Rather 753 B.C.--ED.

[109] There were three tribes in old Rome, the Ramnes on the Palatine, the Tities or Sabines on the Capitoline, and the Luceres; but whether the last were Etruscans or Ramnians or neither is uncertain.--ED.

CHAPTER XVIII

ROMAN RELIGION

=The Roman Gods.=--The Romans, like the Greeks, believed that everything that occurs in the world was the work of a deity. But in place of a God who directs the whole universe, they had a deity for every phenomenon which they saw. There was a divinity to make the seed sprout, another to protect the bounds of the fields, another to guard the fruits. Each had its name, its sex, and its functions.

The principal gods were Jupiter, god of the heaven; Janus, the two-faced god (the deity who opens); Mars, god of war; Mercury, god of trade; Vulcan, god of fire; Neptune, god of the sea; Ceres, goddess of grains, the Earth, the Moon, Juno, and Minerva.

Below these were secondary deities. Some personified a quality--for example, Youth, Concord, Health, Peace. Others presided over a certain act in life: when the infant came into the world there were a god to teach him to speak, a goddess to teach him to drink, another charged with knitting his bones, two to accompany him to school, two to take him home again. In short, there was a veritable legion of minor special deities.

Other gods protected a city, a certain section of a mountain, a forest; every river, every fountain, every tree had its little local divinity. It is this that makes an old woman in a Latin romance exclaim, "Our country is so full of gods that it is much easier to find a god than a man."

=Form of the Gods.=--The Romans, unlike the Greeks, did not give their gods a precise form. For a long time there was no idol in Rome; they worshipped Jupiter under the form of a rock, Mars under that of a sword. It was later that they imitated the wooden statues of the Etruscans and the marbles of the Greeks. Perhaps they did not at first conceive of the gods as having human forms.

Unlike the Greeks they did not imagine marriage and kinship among their gods; they had no legends to tell of these relationships; they knew of no Olympus where the gods met together. The Latin language had a very significant word for designating the gods: they were called Manifestations. They were the manifestations of a mysterious divine power. This is why they were formless, without family relationship, without legends. Everything that was known of the gods was that each controlled a natural force and could benefit or injure men.

=Principles of the Roman Religion.=--The Roman was no lover of these pale and frigid abstractions; he even seemed to fear them. When he invoked them, he covered his face, perhaps that he might not see them. But he thought that they were potent and that they would render him service, if he knew how to please them. "The man whom the gods favor," says Plautus, "they cause to gain wealth."

The Roman conceives of religion as an exchange of good offices; the worshipper brings offerings and homage; the god in return confers some advantage.[110] If after having made a present to the god the man receives nothing, he considers himself cheated. During the illness of Germanicus the people offered sacrifices for his restoration. When it was announced that Germanicus was dead, the people in their anger overturned the altars and cast the statues of the gods into the streets, because they had not done what was expected of them. And so in our day the Italian peasant abuses the saint who does not give him what he asks.

=Worship.=--Worship, therefore, consists in doing those things that please the gods. They are presented with fruits, milk, wine, or animal sacrifices. Sometimes the statues of the gods are brought from their temples, laid on couches, and served with a feast. As in Greece, magnificent homes (temples[111]) were built for them, and diversions were arranged for them.

=Formalism.=--But it is not enough that one make a costly offering to the gods. The Roman gods are punctilious as to form; they require that all the acts of worship, the sacrifices, games, dedications, shall proceed according to the ancient rules (the rites). When one desires to offer a victim to Jupiter, one must select a white beast, sprinkle salted meal on its head, and strike it with an axe; one must stand erect with hands raised to heaven, the abode of Jupiter, and pronounce a sacred formula. If any part of the ceremonial fails, the sacrifice is of no avail; the god, it is thought, will have no pleasure in it. A magistrate may be celebrating games in honor of the protecting deities of Rome; "if he alters a word in his formula, if a flute-player rests, if the actor stops short, the games do not conform to the rites; they must be recommenced."[112]

And so the prudent man secures the assistance of two priests, one to pronounce the formula, the other to follow the ritual accurately.

Every year the Arval Brothers, a college of priests, assemble in a temple in the environs of Rome where they perform a sacred dance and recite a prayer; this is written in an archaic language which no one any longer comprehends, so much so that at the beginning of the ceremony a written formulary must be given to each of the priests. And yet, ever since the time that they ceased to comprehend it, they continued to chant it without change. This is because the Romans hold before all to the letter of the law in dealing with their gods. This exactness in performing the prescribed ritual is for them their religion. And so they regarded themselves as "the most religious of men." "On all other points we are the inferiors or only the equals of other peoples, but we excel all in religion, that is, the worship we pay the gods."

=Prayer.=--When the Roman prays, it is not to lift his soul and feel himself in communion with a god, but to ask of him a service. He is concerned, then, first to find the god who can render it. "It is as important," says Varro, "to know what god can aid us in a special case as to know where the carpenter and baker live." Thus one must address Ceres if one wants rich harvests, Mercury to make a fortune, Neptune to have a happy voyage. Then the suppliant dons the proper garments, for the gods love neatness; he brings an offering, for the gods love not that one should come with empty hands. Then, erect, the head veiled, the worshipper invokes the god. But he does not know the exact name of the god, for, say the Romans, "no one knows the true names of the gods." He says, then, for example, "Jupiter, greatest and best, or whatever is the name that thou preferrest...." Then he proposes his request, taking care to use always the clearest expressions so that the god may make no mistake. If a libation is offered, one says, "Receive the homage of this wine that I am pouring"; for the god might think that one would present other wine and keep this back. The prayers, too, are long, verbose, and full of repetitions.

=Omens.=--The Romans, like the Greeks, believe in omens. The gods, they think, know the future, and they send signs that permit men to divine them. Before undertaking any act, the Roman consults the gods. The general about to engage in battle examines the entrails of victims; the magistrates before holding an assembly regards the passing birds (called "taking the auspices"). If the signs are favorable, the gods are thought to approve the enterprise; if not, they are against it. The gods often send a sign that had not been requested. Every unexpected phenomenon is the presage of an event. A comet appeared before the death of Caesar and was thought to have announced it.

When the assembly of the people deliberates and it thunders, it is because Jupiter does not wish that anything shall be decided on that day and the assembly must dissolve. The most insignificant fact may be interpreted as a sign--a flash of lightning, a word overheard, a rat crossing the road, a diviner met on the way. And so when Marcellus had determined on an enterprise, he had himself carried in a closed litter that he might be sure of not seeing anything which could impose itself on him as a portent.

These were not the superstitions of the populace; the republic supported six augurs charged with predicting the future. It carefully preserved a collection of prophecies, the Sibylline Books. It had sacred chickens guarded by priests. No public act--assembly, election, deliberation--could be done without the taking of the auspices, that is to say, observation of the flight of birds. In the year 195 it was learned that lightning had struck a temple of Jupiter and that it had hit a hair on the head of the statue of Hercules; a governor wrote that a chicken with three feet had been hatched; the senate assembled to discuss these portents.

=The Priests.=--The priest in Rome, as in Greece, is not charged with the care of souls, he exists only for the service of the god. He guards his temple, administers his property, and performs the ceremonies in his honor. Thus the guild of the Salii (the leapers) watches over a shield which fell from heaven, they said, and which was adored as an idol; every year they perform a dance in arms, and this is their sole function.

The augurs predict the future. The pontiffs superintend the ceremonies of worship; they regulate the calendar and fix the festivals to be celebrated on the various days of the year.

Neither the priests, the augurs, nor the pontiffs form a separate class. They are chosen from among the great families and continue to exercise all the functions of state--judging, presiding over assemblies, and commanding armies. This is the reason that the Roman priests, potent as they were, did not constitute, as in Egypt, a sacerdotal caste. At Rome it was a state religion, but not a government by the priests.

=The Dead.=--The Romans, like the Hindoos and the Greeks, believed that the soul survived the body. If care were taken to bury the body according to the proper rites, the soul went to the lower world and became a god; otherwise the soul could not enter the abode of the dead, but returned to the earth terrifying the living and tormenting them until suitable burial was performed. Pliny the Younger[113] relates the story of a ghost which haunted a house and terrified to death all the inhabitants of the dwelling; a philosopher who was brave enough to follow it discovered at the place where the spectre stopped some bones which had not been buried in the proper manner. The shade of the Emperor Caligula wandered in the gardens of the palace; it was necessary to disinter the body and bury it anew in regular form.

=Cult of the Dead.=--It was of importance, therefore, to both the living and the dead that the rites should be observed. The family of the deceased erected a funeral pile, burned the body on it, and placed the ashes in an urn which was deposited in the tomb, a little chapel dedicated to the Manes,[114] _i.e._, the souls that had become gods. On fixed days of the year the relatives came to the tomb to bring food; doubtless they believed that the soul was in need of nourishment, for wine and milk were poured on the earth, flesh of victims was burned, and vessels of milk and cakes were left behind. These funeral ceremonies were perpetuated for an

indefinite period; a family could not abandon the souls of its ancestors, but continued to maintain their tomb and the funeral feasts. In return, these souls which had become gods loved and protected their posterity. Each family, therefore, had its guardian deities which they called Lares.

=Cult of the Hearth.=--Each family had a hearth, also, that it adored. For the Romans, as for the Hindoos, fire was a god and the hearth an altar. The flame was to be maintained day and night, and offerings made on the hearth of oil, fat, wine, and incense; the fire then became brilliant and rose higher as if nourished by the offering.

Before beginning his meal the Roman thanked the god of the hearth, gave him a part of the food, and poured out for him a little wine (this was the libation). Even the sceptical Horace supped with his slaves before the hearth and offered libation and prayer.

Every Roman family had in its house a sanctuary where were to be found the Lares, the souls of the ancestors, and the altar of the hearth. Rome also had its sacred hearth, called Vesta, an ancient word signifying the hearth itself. Four virgins of the noblest families, the Vestals, were charged with keeping the hearth, for it was necessary that the flame should never be extinguished, and the care of it could be confided only to pure beings. If a Vestal broke her vow, she was buried alive in a cave, for she had committed sacrilege and had endangered the whole Roman people.

THE FAMILY

=Religion of the Family.=--All the members of a family render worship to the same ancestors and unite about the same hearth. They have therefore the same gods, and these are their peculiar possession. The sanctuary where the Lares[115] were kept was concealed in the house and no stranger was to approach it. Thus the Roman family was a little church; it had its religion and its worship to which no others than its members had access. The ancient family was very different from the modern, having its basis in the principles of religion.

=Marriage.=--The first rule of this religion is that one should be the issue of a regular marriage if one is to have the right of adoring the ancestors of the family. Roman marriage, therefore, is at the start a religious ceremony. The father of the bride gives her away outside the house when a procession conducts her to the house of the groom chanting an ancient sacred refrain, "Hymen, O Hymen!" The bride is then led before the altar of the husband where water and fire are presented, and there in the presence of the gods of the family the bride and groom divide between them a cake of meal. Marriage at this period was called confarreatio (communion through the cake). Later another form of marriage was invented. A relative of the bride in the presence of witnesses sells her to the husband who declares that he buys her for his wife. This is marriage by sale (coemptio).

For the Romans as for the Greeks marriage is a religious duty; religion ordains that the family should not become extinct. The Roman, therefore, declares when he marries that he takes his wife to perpetuate the family through their children. A noble Roman who sincerely loved his wife repudiated her because she brought him no children.

=The Roman Woman.=--The Roman woman is never free. As a young girl, she belongs to her father who chooses her husband for her; married, she comes under the power of her husband--the jurisconsults say she is under his "manus," _i.e._, she is in the same position as his daughter. The woman always has a master who has the right of life and death over her. And yet, she is never treated like a slave. She is the equal in dignity of her husband; she is called the mother of the family (materfamilias) just as her husband is called the father of the family (paterfamilias). She is the mistress in the house, as he is the master. She gives orders to the slaves whom she charges with all the heavy tasks--the grinding of the grain, the making of bread, and the cooking. She sits in the seat of honor (the atrium), spins and weaves, apportions work to the slaves, watches the children, and directs the house. She is not excluded from association with the men, like the Greek woman; she eats at the table with her husband, receives visitors, goes into town to dinner, appears at the public ceremonies, at the theatre, and even at the courts. And still she is ordinarily uncultured; the Romans do not care to instruct their daughters; the quality which they most admire in woman is gravity, and on her tomb they write by way of eulogy, "She kept the house and spun linen."

=The Children.=--The Roman child belongs to the father like a piece of property. The father has the right of exposing him in the street. If he accepts the child, the latter is brought up at first in the house. Girls remain here until marriage; they spin and weave under the supervision of their mother. The boys walk to the fields with their father and exercise themselves in arms. The Romans are not an artistic people; they require no more of their children than that they know how to read, write, and reckon; neither music nor poetry is taught them. They are brought up to be sober, silent, modest in their demeanor, and obedient.

=The Father of the Family.=--The master of the house was called by the Romans the father of the family. The paterfamilias is at once the proprietor of the domain, the priest of the cult of the ancestors, and the sovereign of the family. He reigns as master in his house. He has the right of repudiating his wife, of rejecting his children, of selling them, and marrying them at his pleasure. He can take for himself all that belongs to them, everything that his wife brings to him, and everything that his children gain; for neither the wife nor the children may be proprietors. Finally he has over them all[116] the "right of life and death," that is to say, he is their only judge. If they commit crime, it is not the magistrate who punishes them, but the father of the family who condemns them. One day (186 B.C.) the Roman Senate decreed the penalty of death for all those who had participated in the orgies of the cult of Bacchus. The men were executed, but for all the women who were discovered among the guilty, it was necessary that the Senate should address itself to the fathers of families, and it was these who condemned to death their wives or their daughters. "The husband," said the elder Cato, "is the judge of the wife, he can do with her as he will; if she has committed any fault, he chastises her; if she has drunk wine, he condemns her; if she has been unfaithful to him, he kills her." When Catiline conspired against the Senate, a senator perceived that his own son had taken part in the conspiracy; he had him arrested, judged him, and condemned him to death.

The power of the father of the family endured as long as life; the son was never freed from it. Even if he became consul, he remained subject to the power of his father. When the father died, the sons became in turn fathers of families. As for the wife, she could never attain freedom; she fell under the power of the heir of her husband; she could, then, become subject to her own son.

FOOTNOTES:

[110] A legend represents King Numa debating with Jupiter the terms of a contract: "You will sacrifice a head to me?" says Jupiter. "Very well," says Numa, "the head of an onion that I shall take in my garden." "No," replies Jupiter, "but I want something that pertains to a man." "We will give you then the tip of the hair." "But it must be alive." "Then we will add to this a little fish." Jupiter laughed and consented to this.

[111] In Rome, as in Greece, the temple was called a house.

[112] The remark is Cicero's.

[113] Pliny, Epistles, vii, 27. See another story in Plautus's Mostellaria.

[114] The letters D.M. found on Roman tombs are the initials of Dei Manes.

[115] They were called the Penates, that is to say, the gods of the interior.

[116] In the language of the Roman law the wife, children, and slaves "are not their own masters."

CHAPTER XIX

THE ROMAN CITY

FORMATION OF THE ROMAN PEOPLE

=The Kings.=--Tradition relates that Rome for two centuries and a half was governed by kings. They told not only the names of these kings and the date of their death, but the life of each.

They said there were seven kings. Romulus, the first king, came from the Latin city of Alba, founded the hamlet on the Palatine, and killed his brother who committed the sacrilege of leaping over the sacred furrow encircling the settlement; he then allied himself with Tatius, a Sabine king. (A legend of later origin added that he had founded at the foot of the hill-city a quarter surrounded with a palisade where he received all the adventurers who wished to come to him.)

Numa Pompilius, the second king, was a Sabine. It was he who organized the Roman religion, taking counsel with a goddess, the nymph Egeria who dwelt in a wood.

The third king, Tullus Hostilius, was a warrior. He made war on Alba, the capital of the Latin confederation, took and destroyed it.

Ancus Martius, the fourth king, was the grandson of Numa and built the wooden bridge over the Tiber and founded the port of Ostia through which commerce passed up the river to Rome.

The last three kings were Etruscans. Tarquin the Elder enlarged the territory of Rome and introduced religious ceremonies from Etruria. Servius Tullius organized the Roman army, admitting all the citizens without distinction of birth and separating them into centuries (companies) according to wealth. The last king, Tarquinius Superbus, oppressed the great families of Rome; some of the nobles conspired against him and succeeded in expelling him. Since this time there were no longer any kings. The Roman state, or as they said, the commonwealth (res publica) was governed by the consuls, two magistrates elected each year.

It is impossible to know how much truth there is in this tradition, for it took shape a long time after the Romans began to write their history, and it includes so many legends that we cannot accept it in its entirety.

Attempt has been made to explain these names of kings as symbols of a race or class. The early history of Rome has been reconstructed in a variety of ways, but the greater the labor applied to it, the less the agreement among students with regard to it.

=The Roman People.=--About the fifth century before Christ there were in Rome two classes of people, the patricians and the plebeians. The patricians were the descendants of the old families who had lived from remote antiquity on the little territory in the vicinity of the city; they alone had the right to appear in the assembly of the people, to assist in religious ceremonies, and to hold office. Their ancestors had founded the Roman state, or as they called it, the Roman city (Civitas), and these had bequeathed it to them. And so they were the true people of Rome.

=The Plebs.=--The plebeians were descended from the foreigners[117] established in the city, and especially from the conquered peoples of the neighboring cities; for Rome had gradually subjected all the Latin cities and had forcibly annexed their inhabitants. Subjects and yet aliens, they obeyed the government of Rome, but they could have no part in it. They did not possess the Roman religion and could not participate in its ceremonies. They had not even the right of intermarrying with the patrician families. They were called the plebs (the multitude) and were not considered a part of the Roman people. In the old prayers we still find this formula: "For the welfare of the people and the plebs of Rome."

=Strife between Patricians and Plebeians.=--The people and the plebs were like two distinct peoples, one of masters, the other of subjects. And yet the plebeians were much like the patricians. Soldiers, like them, they served in the army at their own cost and suffered death in the service of the Roman people; peasants like them, they lived on their domains. Many of the plebeians were rich and of ancient family. The only difference was that they were descended from a great family of some conquered Latin city, while the patricians were the scions of an old family in the conquering city.

=Tribunes of the Plebs.=--One day, says the legend, the plebeians, finding themselves mistreated, withdrew under arms to a mountain, determined to break with the Roman people. The patricians in consternation sent to them Menenius Agrippa who told them the fable of the members and the stomach. The plebs consented to return but they made a treaty with the people. It was agreed that their chiefs (they called them tribunes of the plebs) should have the right of protecting the plebeians against the magistrates of the people and of prohibiting any measure against them. All that was necessary was to pronounce the word "Veto" (I forbid); this single word stopped everything; for religion prevented attacks on a tribune under penalty of being devoted to the infernal gods.

=Triumph of the Plebs.=--The strife between the two orders beginning at the end of the fifth century continued for two centuries (494 B.C. to about 300 B.C.).[118]

The plebeians, much more numerous and wealthy, ended by gaining the victory. They first secured the adoption of laws common to the two orders; afterward that marriage should be permitted between the patricians and the plebeians. The hardest task was to obtain the high magistracies, or, as it was said, "secure the honors." Religious scruple ordained, indeed, that before one could be named as a magistrate, the gods must be asked for their approval of the choice. This was determined by inspecting the flight of birds ("taking the auspices"). But the old Roman religion allowed the auspices to be taken only on the name of a patrician; it was not believed that the gods could accept a plebeian magistrate. But there were great plebeian families who were bent on being the equals of the patrician families in dignity, as they were in riches and in importance. They gradually forced the patricians to open to them all the offices, beginning with the consulship, and ending with the great pontifical office (Pontifex Maximus). The first plebeian consul was named in 366 B.C., the first plebeian pontifex maximus in 302 B.C.[119] Patricians and plebeians then coalesced and henceforth formed but one people.

THE ROMAN PEOPLE

=The Right of Citizenship.=--The _people_ in Rome, as in Greece, is not the whole of the inhabitants, but the body of citizens. Not every man who lives in the territory is a citizen, but only he who has the right of citizenship. The citizen has numerous privileges:

1. He alone is a member of the body politic; he alone has the right of voting in the assemblies of the Roman people, of serving in the army, of being present at the religious ceremonials at Rome, of being elected a Roman magistrate. These are what were called public rights.

2. The citizen alone is protected by the Roman law; he only has the right of marrying legally, of becoming the father of a family, that is to say, of being master of his wife and his children, of making his will, of buying or selling. These were the private rights.

Those who were not citizens were not only excluded from the army and the assembly, but they could not marry, could not possess the absolute power of the father, could not hold property legally, could not invoke the Roman law, nor demand justice at a Roman tribunal. Thus the citizens constituted an aristocracy amidst the other inhabitants of the city. But they were not equal among themselves; there were class differences, or, as the Romans said, ranks.

=The Nobles.=--In the first rank are the nobles. A citizen is noble when one of his ancestors has held a magistracy, for the magisterial office in Rome is an honor, it ennobles the occupant and also his posterity.

When a citizen becomes aedile, praetor, or consul, he receives a purple-bordered toga, a sort of throne (the curule chair), and the right of having an image made of himself. These images are statuettes, at first in wax, later in silver. They are placed in the atrium, the sanctuary of the house, near the hearth and the gods of the family; there they stand in niches like idols, venerated by posterity. When any one of the family dies, the images are brought forth and carried in the funeral procession, and a relative pronounces the oration for the dead. It is these images that ennoble a family that preserves them. The more images there are in a family, the nobler it is. The Romans spoke of those who were "noble by one image" and those who were "noble by many images."

The noble families of Rome were very few (they would not amount to 300), for the magistracies which conferred nobility were usually given to men who were already noble.

=The Knights.=--Below the nobles were the knights. They were the rich who were not noble. Their fortune as inscribed on the registers of the treasury must amount to at least 400,000[120] sesterces. They were merchants, bankers, and contractors; they did not govern, but they grew rich. At the theatre they had places reserved for them behind the nobles.

If a knight were elected to a magistracy, the nobles called him a "new man" and his son became noble.

=The Plebs.=--Those who were neither nobles nor knights formed the mass of the people, the plebs. The majority of them were peasants, cultivating a little plat in Latium or in the Sabine country. They were the descendants of the Latins or the Italians who were subjugated by the Romans. Cato the Elder in his book on Agriculture gives us an idea of their manners: "Our ancestors, when they wished to eulogize a man, said 'a good workman,' 'a good farmer'; this encomium seemed the greatest of all."[121]

Hardened to work, eager for the harvest, steady and economical, these laborers constituted the strength of the Roman armies. For a long time they formed the assembly too, and dictated the elections. The nobles who wished to be elected magistrates came to the parade-ground to grasp the hand of these peasants ("prensare manus," was the common expression). A candidate, finding the hand of a laborer callous, ventured to ask him, "Is it because you walk on your hands?" He was a noble of great family, but he was not elected.

=The Freedmen.=--The last of all the citizens are the freedmen, once slaves, or the sons of slaves. The taint of their origin remains on them; they are not admitted to service in the Roman army and they vote after all the rest.

THE GOVERNMENT OF THE REPUBLIC

=The Comitia.=--The government of Rome called itself a republic (Respublica), that is to say, a thing of the people. The body of citizens called the people was regarded as absolute master in the state. It is this body that elects the magistrates, votes on peace and war, and that makes the laws. "The law," say the jurisconsults, "is what the Roman people ordains." At Rome, as in Greece, the people do not appoint deputies, they pass on the business itself. Even after more than 500,000 men scattered over all Italy were admitted into the citizenship, the citizens had to go in person to Rome to exercise their rights. The people, therefore, meet at but one place; the assembly is called the Comitia.

A magistrate convokes the people and presides over the body. Sometimes the people are convoked by the blast of the trumpet and come to the parade-ground (the Campus Martius), ranging themselves by companies under their standards. This is the Comitia by centuries. Sometimes they assemble in the market-place (the forum) and separate themselves into thirty-five groups, called tribes. Each tribe in turn enters an enclosed space where it does its voting. This is the Comitia by tribes. The magistrate who convokes the assembly indicates the business on which the suffrages are to be taken, and when the assembly has voted, it dissolves. The people are sovereign, but accustomed to obey their chiefs.

=The Magistrates.=--Every year the people elect officials to govern them and to them they delegate absolute power. These are called magistrates (those who are masters). Lictors march before them bearing a bundle of rods and an axe, emblems of the magisterial powers of chastising and condemning to death. The magistrate has at once the functions of presiding over the popular assembly and the senate, of sitting in court, and of commanding the army; he is master everywhere. He convokes and dissolves the assembly at will, he alone renders judgment, he does with the soldiers as he pleases, putting them to death without even taking counsel with his officers. In a war against the Latins Manlius, the Roman general, had forbidden the soldiers leaving camp: his son, provoked by one of the enemy, went forth and killed him; Manlius had him arrested and executed him immediately.

According to the Roman expression, the magistrate has the power of a king; but this power is brief and divided. The magistrate is elected for but one year and he has a colleague who has the same power as himself. There are at once in Rome two consuls who govern the people and command the armies, and several praetors to serve as subordinate governors or commanders and to pronounce judgment. There are other magistrates, besides--two censors, four aediles to supervise the public ways and the markets, ten tribunes of the plebs, and quaestors to care for the state treasure.

=The Censors.=--The highest of all the magistrates are the censors. They are charged with taking the census every five years, that is to say, the enumeration of the Roman people. All the citizens appear before them to declare under oath their name, the number of their children and their slaves, the amount of their fortune; all this is inscribed on the registers. It is their duty, too, to draw up the list of the senators, of the knights, and of the citizens, assigning to each his proper rank in the city. They are charged as a result with making the lustrum, a great ceremony of purification which occurs every five years.[122]

On that day all the citizens are assembled on the Campus Martius arranged in order of battle; thrice there are led around the assembly three expiatory victims, a bull, a ram, and a swine; these are killed and their blood sprinkled on the people; the city is purified and reconciled with the gods.

The censors are the masters of the registration and they rank each as they please; they may degrade a senator by striking him from the senate-list, a knight by not registering him among the knights, and a citizen by not placing his name on the registers of the tribes. It is for them an easy means of punishing those whom they regard at fault and of reaching those whom the law does not condemn. They have been known to degrade citizens for poor tillage of the soil and for having too costly an equipage, a senator because he possessed ten pounds of silver, another for having repudiated his wife. It is this overweening power that the Romans call the supervision of morals. It makes the censors the masters of the city.

=The Senate.=--The Senate is composed of about 300 persons appointed by the censor. But the censor does not appoint at random; he chooses only rich citizens respected and of high family, the majority of them former magistrates. Almost always he appoints those who are already members of the Senate, so that ordinarily one remains a senator for life. The Senate is an assembly of the principal men of Rome, hence its authority. As soon as business is presented, one of the magistrates convokes the senators in a temple, lays the question before them, and then asks "what they think concerning this matter." The senators reply one by one, following the order of dignity. This is what they call "consulting the Senate," and the judgment of the majority is a senatus consultum (decree of the Senate). This conclusion is only advisory as the Senate has no power to make laws; but Rome obeys this advice as if it were a law. The people have confidence in the senators, knowing that they have more experience than themselves; the magistrates do not dare to resist an assembly composed of nobles who are their peers. And so the Senate regulates all public business: it declares war and determines the number of the armies; it receives ambassadors and makes peace; it fixes the revenues and the expenses. The people ratify these measures and the magistrates execute them. In 200 B.C. the Senate decided on war with the king of Macedon, but the people in terror refused to approve it: the Senate then ordered a magistrate to convoke the comitia anew and to adopt a more persuasive speech. This time the people voted for the war. In Rome it was the people who reigned, just as is the case with the king in England, but it was the Senate that governed.

=The Offices.=--Being magistrate or senator in Rome is not a profession. Magistrates or senators spend their time and their money without receiving any salary. A magistracy in Rome is before all an honor. Entrance to it is to nobles, at most to knights, but always to the rich; but these come to the highest magistracies only after they have occupied all the others. The man who aims one day to govern Rome must serve in the army during ten campaigns. Then he may be elected quaestor and he receives the administration of the state treasury. After this he becomes aedile, charged with the policing of the city and with the provision of the corn supply. Later he is elected praetor and gives judgment in the courts. Later yet, elected consul, he commands an army and presides over the assemblies. Then only may he aspire to the censorship. This is the highest round of the ladder and may be reached hardly before one's fiftieth year. The same man has therefore, been financier, administrator, judge, general, and governor before arriving at this original function of censor, the political distribution of the Roman people. This series of offices is what is called the "order of the honors." Each of these functions lasts but one year, and to rise to the one next higher a new election is necessary. In the year which precedes the voting one must show one's self continually in the streets, "circulate" as the Romans say (_ambire_: hence the word "ambition"), to solicit the suffrages of the people. For all this time it is the custom to wear a white toga, the very sense of the word "candidate" (white garment).

FOOTNOTES:

[117] Probably some of the plebeians originated in non-noble Roman families.--ED.

[118] We know the story of this contest only through Livy and Dionysius of Halicarnassus; their very dramatic account has become celebrated, but it is only a legend frequently altered by falsifiers.

[119] The pontificate was opened to the plebeians by the Ogulnian Law of 300 B.C. The first plebeian pontifex maximus was in 254 B.C. Livy, Epitome, xviii.--ED.

[120] This qualification was set in the last century of the republic.--ED.

[121] He cites several of their old proverbs: "A bad farmer is one who buys what his land can raise." "It is bad economy to do in the day what can be done at night."

[122] After the completion of the census.--ED.

CHAPTER XX

ROMAN CONQUEST

THE ROMAN ARMY

=Military Service.=--To be admitted to service in the Roman army one must be a Roman citizen. It is necessary to have enough wealth to equip one's self at one's own expense, for the state furnishes no arms to its soldiers; down to 402 B.C. it did not even pay them. And so only those citizens are enrolled who are provided with at least a small fortune. The poor (called the proletariat) are exempt from service, or rather, they have no right to serve. Every citizen who is rich enough to be admitted to the army owes the state twenty campaigns; until these are completed the man remains at the disposition of the consul and this from the age of seventeen to forty-six. In Rome, as in the Greek cities, every man is at once citizen and soldier. The Romans are a people of small proprietors disciplined in war.

=The Levy.=--When there was need of soldiers, the consul ordered all the citizens qualified for service to assemble at the Capitol. There the officers elected by the people chose as many men as were necessary to form the army. This was the enrolment (the Romans called it the Choice); then came the military oath. The officers first took the oath, and then the rank and file; they swore to obey their general, to follow him wherever he led them and to remain under the standards until he released them from their oath. One man pronounced the formula and each in turn advanced and said, "I also." From this time the army was bound to the general by the bonds of religion.

=Legions and Allies.=--The Roman army was at first called the Legion (levy). When the people increased in number, instead of one legion, several were formed.

The legion was a body of 4,200 to 5,000 men, all Roman citizens. The smallest army had always at least one legion, every army commanded by a consul had at least two. But the legions constituted hardly a half of the Roman army. All the subject peoples in

Italy were required to send troops, and these soldiers, who were called allies, were placed under the orders of Roman officers. In a Roman army the allies were always a little more numerous than the citizens of the legions. Ordinarily with four legions (16,800 men) there were enrolled 20,000 archers and 40,000 horse from the allies. In the Second Punic War, in 218 B.C., 26,000 citizens and 45,000 allies were drawn for service. Thus the Roman people, in making war, made use of its subjects as well as of its citizens.

=Military Exercises.=--Rome had no gymnasium; the future soldiers exercised themselves on the parade-ground, the Campus Martius, on the other side of the Tiber. There the young man marched, ran, leaped under the weight of his arms, fenced with his sword, hurled the javelin, wielded the mattock, and then, covered with dust and with perspiration, swam across the Tiber. Often the older men, sometimes even the generals, mingled with the young men, for the Roman never ceased to exercise. Even in the campaign the rule was not to allow the men to be unoccupied; once a day, at least, they were required to take exercise, and when there was neither enemy to fight nor intrenchment to erect, they were employed in building roads, bridges, and aqueducts.

=The Camp.=--The Roman soldier carried a heavy burden--his arms, his utensils, rations for seventeen days, and a stake, in all sixty Roman pounds. The army moved more rapidly as it was not encumbered with baggage. Every time that a Roman army halted for camp, a surveyor traced a square enclosure, and along its lines the soldiers dug a deep ditch; the earth which was excavated, thrown inside, formed a bank which they fortified with stakes. The camp was thus defended by a ditch and a palisade. In this improvised fortress the soldiers erected their tents, and in the middle was set the Praetorium, the tent of the general. Sentinels mounted guard throughout the night, and so prevented the army from being surprised.

=The Order of Battle.=--In the presence of the enemy the soldiers did not form in a solid mass, as did the Greeks. The legion was divided into small bodies of 120 men, called maniples because they had for standards bundles of hay.[123] The maniples were ranged in quincunx form in three lines, each separated from the neighboring maniple in such a way as to manoeuvre separately. The soldiers of the maniples of the first line hurled their javelins, grasped their swords, and began the battle. If they were repulsed, they withdrew to the rear through the vacant spaces. The second line of the maniples then in turn marched to the combat. If it was repulsed, it fell back on the third line. The third line was composed of the best men of the legion and was equipped with lances. They received the others into their ranks and threw themselves on the enemy. The army was no longer a single mass incapable of manoeuvring; the general could form his lines according to the nature of the ground. At Cynoscephalae, where for the first time the two most renowned armies of antiquity met, the Roman legion and the Macedonian phalanx, the ground was bristling with hills; on this rugged ground the 16,000 Macedonion hoplites could not remain in order, their ranks were opened, and the Roman platoons threw themselves into the gaps and demolished the phalanx.

=Discipline.=--The Roman army obeyed a rude discipline. The general had the right of life and death over all his men. The soldier who quitted his post or deserted in battle was condemned to death; the lictors bound him to a post, beat him with rods, and cut off his head; or the soldiers may have killed him with blows of their staves. When an entire body of troops mutinied, the general separated the guilty into groups of ten and drew by lot one from every group to be executed. This was called decimation (from decimus, the tenth). The others were placed on a diet of barley-bread and made to camp outside the lines, always in danger of surprise from the enemy. The Romans never admitted that their soldiers were conquered or taken prisoners: after the battle of Cannae the 3,000 soldiers who escaped the carnage were sent by the senate to serve in Sicily without pay and without honors until the enemy should be expelled from Italy; the 8,000 left in the camp were taken by Hannibal who offered to return them for a small ransom, but the senate refused to purchase them.

=Colonies and Military Roads.=--In the countries that were still only partially subject, Rome established a small garrison. This body of soldiers founded a town which served as a fortress, and around about it the lands were cut into small domains and distributed to the soldiers. This is what they called a Colony. The colonists continued to be Roman citizens and obeyed all commands from Rome. Quite different from a Greek colony which emancipated itself even to the point of making war on its mother city, the Roman colony remained a docile daughter. It was only a Roman garrison posted in the midst of the enemy. Almost all these military posts were in Italy, but there were others besides; Narbonne and Lyons were once Roman colonies.

To hold these places and to send their armies to a distance the Romans built military roads. These were causeways constructed in a straight line, of limestone, stone, and sand. The Romans covered their empire with them. In a land like France there is no part where one does not find traces of the Roman roads.

CHARACTER OF THE CONQUEST

=War.=--There was at Rome a temple consecrated to the god Janus whose gates remained open while the Roman people continued at war. For the five hundred years of the republic this temple was closed but once and that for only a few years. Rome, then, lived in a state of war. As it had the strongest army of the time, it finished by conquering all the other peoples and by overcoming the ancient world.

=Conquest of Italy.=--Rome began by subjecting her neighbors, the Latins, first, then the little peoples of the south, the Volscians, the AEquians, the Hernicans, later the Etruscans and the Samnites, and finally the Greek cities. This was the hardest and slowest of their conquests: beginning with the time of the kings, it did not terminate until 266, after four centuries of strife.[124]

The Romans had to fight against peoples of the same race as themselves, as vigorous and as brave as they. Some who were not content to obey they exterminated. The rich plains of the Volscians became a swampy wilderness, uninhabitable even to the present time, the gloomy region of the Pontine marshes.

In the land of the Samnites there were still recognizable, three hundred years after the war, the forty-five camps of Decius and the eighty-six of Fabius, less apparent by the traces of their intrenchments than by the solitude of the neighborhood.

=The Punic Wars.=--Come into Sicily, Rome antagonized Carthage. Then began the Punic wars (that is to say, against the Phoenicians). There were three of these wars. The first, from 264 to 241, was determined by naval battles; Rome became mistress of Sicily. It was related that Rome had never had any war-ships, that she took as a model a Carthaginian galley cast ashore by accident on her coast and began by exercising her oarsmen in rowing on the land. This legend is without foundation for the Roman navy had long endured. This is the Roman account of this war: the Roman consul Duillius had vanquished the Carthaginian fleet at Mylae (260); a Roman army had disembarked in Africa under the lead of Regulus, had been attacked and destroyed (255); Regulus was sent as a prisoner to Rome to conclude a peace, but persuading the Senate to reject it, he returned to Carthage where he perished by torture. The war was concentrated in Sicily where the Carthaginian fleet, at first victorious at Drepana, was defeated at the AEgates Islands; Hamilcar, besieged on Mount Eryx, signed the peace.

The second war (from 218 to 201) was the work of Hannibal.

The third war was a war of extermination: the Romans took Carthage by assault, razed it, and conquered Africa.

These wars had long made Rome tremble. Carthage had the better navy, but its warriors were armed adventurers fighting not for country but for pay, lawless, terrible under a general like Hannibal.

=Hannibal.=--Hannibal, who directed the whole of the second war and almost captured Rome, was of the powerful family of the Barcas. His father Hamilcar had commanded a Carthaginian army in the first Punic war and had afterwards been charged with the conquest of Spain. Hannibal was then but a child, but his father took him with him. The departure of an army was always accompanied by sacrifices to the gods of the country; it was said that Hamilcar after the sacrifice made his infant son swear eternal enmity to Rome.

Hannibal, brought up in the company of the soldiers, became the best horseman and the best archer of the army. War was his only aim in life; his only needs, therefore, were a horse and arms. He had made himself so popular that at the death of Hasdrubal who was in the command of the army, the soldiers elected him general without waiting for orders from the Carthaginian senate. Thus Hannibal found himself at the age of twenty-one at the head of an army which was obedient only to himself. He began war, regardless of the senate at Carthage, by advancing to the siege of Saguntum, a Greek colony allied with Rome; he took this and destroyed it.

The glory of Hannibal was that he did not wait for the Romans, but had the audacity to march into Italy to attack them. As he had no fleet, he resolved to advance by land, through the Pyrenees, crossing the Rhone and the Alps. He made sure of the alliance of the Gallic peoples and penetrated the Pyrenees with an army of 60,000 men, African and Spanish mercenaries, and with 37 war-elephants. A Gallic people wished to stop him at the Rhone, but he sent a detachment to pass the river some leagues farther up the stream and to attack the Gauls in the rear; the mass of the army crossed the river in boats, the elephants on great rafts.

He next ascended the valley of the Isere and arrived at the Alps at the end of October; he crossed them regardless of the snow and the attacks of the mountaineers; many men and horses rolled down the precipices. But nine days were consumed in attaining the summits of the Alps. The descent was very difficult; the pass by which he had to go was covered with ice and he was compelled to cut a road out of the rock. When he arrived in the plain, the army was reduced to half its former number.

Hannibal met three Roman armies in succession, first at the Ticinus, next on the banks of the Trebia, and last near Lake Trasimenus in Etruria. He routed all of them. As he advanced, his army increased in number; the warriors of Cisalpine Gaul (northern Italy) joined him against the Romans. He took up position beyond Rome in Apulia, and it was here that the Roman army came to attack him. Hannibal had an army only half as large as theirs, but he had African cavalrymen mounted on swift horses; he formed his lines in the plain of Cannae so that the Romans had the sun in their face and the dust driven by the wind against them; the Roman army was surrounded and almost annihilated (216). It was thought that Hannibal would march on Rome, but he did not consider himself strong enough to do it. The Carthaginian senate sent him no reenforcements. Hannibal endeavored to take Naples and to have Rome attacked by the king of Macedon; he succeeded only in gaining some towns which Rome besieged and destroyed. Hannibal remained nine years in south Italy; at last his brother Hasdrubal started with the army of Spain to assist him, and made his way almost to central Italy. The two Carthaginian armies marched to unite their forces, each opposed by a Roman army under the command of a consul. Nero, facing Hannibal, had the audacity to traverse central Italy and to unite with his colleague who was intrenched against Hasdrubal. One morning Hasdrubal heard the trumpets sounding twice in the camp of the Romans, a sign that there were two consuls in the camp. He believed his brother was conquered and so retreated; the Romans pursued him, he was killed and his entire army massacred. Then Nero rejoined the army which he had left before Hannibal and threw the head of Hasdrubal into the Carthaginian camp (207). Hannibal, reduced to his own troops, remained in Calabria for five years longer. The descent of a Roman army on Africa compelled him to leave Italy; he massacred the Italian soldiers who refused to accompany him and embarked for Carthage (203). The battle of Zama (202) terminated the war. Hannibal had counted as usual on drawing the Romans within his lines and surrounding them; but Scipio, the Roman general, kept his troops in order and on a second attack threw the enemy's army into rout. Carthage was obliged to treat for peace; she relinquished everything she possessed outside of Africa, ceding Spain to the Romans. She bound herself further to surrender her navy and the elephants, to pay over $10,000,000 and to agree not to make war without the permission of Rome.

Hannibal reorganized Carthage for a new war. The Romans, disturbed at this, demanded that the Carthaginians put him to death. Hannibal fled to Antiochus, king of Syria, and proposed to him to incite a revolt in Italy against Rome; but Antiochus, following the counsel of his courtiers, distrusted Hannibal and invaded Greece, where his army was captured. Hannibal withdrew to the king of Bithynia. The Romans sent Flamininus thither to take him, but Hannibal, seeing his house surrounded, took the poison which he always had by him (183).

=Conquests of the Orient.=--The Greek kings, successors of the generals of Alexander, divided the Orient among themselves. The most powerful of these took u

EDITORIAL NOTE PREFACE TO THE SECOND EDITION JEST, RUSE, AND REVENGE: A PRELUDE IN RHYME BOOK FIRST BOOK SECOND BOOK THIRD BOOK FOURTH: SANCTUS JANUARIUS BOOK FIFTH: WE FEARLESS ONES APPENDIX: SONGS OF PRINCE FREE-AS-A-BIRD

EDITORIAL NOTE

"The Joyful Wisdom," written in 1882, just before "Zarathustra," is rightly judged to be one of Nietzsche's best books. Here the essentially grave and masculine face of the poet-philosopher is seen to light up and suddenly break into a delightful smile. The warmth and kindness that beam from his features will astonish those hasty psychologists who have never divined that behind the destroyer is the creator, and behind the blasphemer the lover of life. In the retrospective valuation of his work which appears in "Ecce Homo" the author himself observes with truth that the fourth book, "Sanctus Januarius," deserves especial attention: "The

whole book is a gift from the Saint, and the introductory verses express my gratitude for the most wonderful month of January that I have ever spent." Book fifth "We Fearless Ones," the Appendix "Songs of Prince Free-as-a-Bird," and the Preface, were added to the second edition in 1887.

The translation of Nietzsche's poetry has proved to be a more embarrassing problem than that of his prose. Not only has there been a difficulty in finding adequate translators--a difficulty overcome, it is hoped, by the choice of Miss Petre and Mr Cohn,--but it cannot be denied that even in the original the poems are of unequal merit. By the side of such masterpieces as "To the Mistral" are several verses of comparatively little value. The Editor, however, did not feel justified in making a selection, as it was intended that the edition should be complete. The heading, "Jest, Ruse and Revenge," of the "Prelude in Rhyme" is borrowed from Goethe.

PREFACE TO THE SECOND EDITION.

1.

Perhaps more than one preface would be necessary for this book; and after all it might still be doubtful whether any one could be brought nearer to the _experiences_ in it by means of prefaces, without having himself experienced something similar. It seems to be written in the language of the thawing-wind: there is wantonness, restlessness, contradiction and April-weather in it; so that one is as constantly reminded of the proximity of winter as of the _victory_ over it: the victory which is coming, which must come, which has perhaps already come.... Gratitude continually flows forth, as if the most unexpected thing had happened, the gratitude of a convalescent--for _convalescence_ was this most unexpected thing. "Joyful Wisdom": that implies the Saturnalia of a spirit which has patiently withstood a long, frightful pressure--patiently, strenuously, impassionately, without submitting, but without hope--and which is now suddenly o'erpowered with hope, the hope of health, the _intoxication_ of convalescence. What wonder that much that is unreasonable and foolish thereby comes to light: much wanton tenderness expended even on problems which have a prickly hide, and are not therefore fit to be fondled and allured. The whole book is really nothing but a revel after long privation and impotence: the frolicking of returning energy, of newly awakened belief in a to-morrow and after-to-morrow; of sudden sentience and prescience of a future, of near adventures, of seas open once more, and aims once more permitted and believed in. And what was now all behind me! This track of desert, exhaustion, unbelief, and frigidity in the midst of youth, this advent of grey hairs at the wrong time, this tyranny of pain, surpassed, however, by the tyranny of pride which repudiated the _consequences_ of pain--and consequences are comforts,--this radical isolation, as defence against the contempt of mankind become morbidly clairvoyant, this restriction upon principle to all that is bitter, sharp, and painful in knowledge, as prescribed by the _disgust_ which had gradually resulted from imprudent spiritual diet and pampering--it is called Romanticism,--oh, who could realise all those feelings of mine! He, however, who could do so would certainly forgive me everything, and more than a little folly, boisterousness and "Joyful Wisdom"--for example, the handful of songs which are given along with the book on this occasion,--songs in which a poet makes merry over all poets in a way not easily pardoned.--Alas, it is not only on the poets and their fine "lyrical sentiments" that this reconvalescent must vent his malignity: who knows what kind of victim he seeks, what kind of monster of material for parody will allure him ere long? _Incipit tragœdia,_ it is said at the conclusion of this seriously frivolous book; let people be on their guard! Something or other extraordinarily bad and wicked announces itself: _incipit parodia,_ there is no doubt....

2.

--But let us leave Herr Nietzsche; what does it matter to people that Herr Nietzsche has got well again?... A psychologist knows few questions so attractive as those concerning the relations of health to philosophy, and in the case when he himself falls sick, he carries with him all his scientific curiosity into his sickness. For, granting that one is a person, one has necessarily also the philosophy of one's personality; there is, however, an important distinction here. With the one it is his defects which philosophise, with the other it is his riches and powers. The former _requires_ his philosophy, whether it be as support, sedative, or medicine, as salvation, elevation, or self-alienation; with the latter it is merely a fine luxury, at best the voluptuousness of a triumphant gratitude, which must inscribe itself ultimately in cosmic capitals on the heaven of ideas. In the other more usual case, however, when states of distress occupy themselves with philosophy (as is the case with all sickly thinkers--and perhaps the sickly thinkers preponderate in the history of philosophy), what will happen to the thought itself which is brought under the _pressure_ of sickness? This is the important question for psychologists: and here experiment is possible. We philosophers do just like a traveller who resolves to awake at a given hour, and then quietly yields himself to sleep: we surrender ourselves temporarily, body and soul, to the sickness, supposing we become ill--we shut, as it were, our eyes on ourselves. And as the traveller knows that something _does not_ sleep,

that something counts the hours and will awake him, we also know that the critical moment will find us awake--that then something will spring forward and surprise the spirit _in the very act,_ I mean in weakness, or reversion, or submission, or obduracy, or obscurity, or whatever the morbid conditions are called, which in times of good health have the _pride_ of the spirit opposed to them (for it is as in the old rhyme: "The spirit proud, peacock and horse are the three proudest things of earthly source"). After such self-questioning and self-testing, one learns to look with a sharper eye at all that has hitherto been philosophised; one divines better than before the arbitrary by-ways, side-streets, resting-places, and _sunny_ places of thought, to which suffering thinkers, precisely as sufferers, are led and misled: one knows now in what direction the sickly _body_ and its requirements unconsciously press, push, and allure the spirit--towards the sun, stillness, gentleness, patience, medicine, refreshment in any sense whatever. Every philosophy which puts peace higher than war, every ethic with a negative grasp of the idea of happiness, every metaphysic and physic that knows a _finale,_ an ultimate condition of any kind whatever, every predominating, æsthetic or religious longing for an aside, a beyond, an outside, an above--all these permit one to ask whether sickness has not been the motive which inspired the philosopher. The unconscious disguising of physiological requirements under the cloak of the objective, the ideal, the purely spiritual, is carried on to an alarming extent,--and I have often enough asked myself, whether on the whole philosophy hitherto has not generally been merely, an interpretation of the body, and a _misunderstanding of the body._ Behind the loftiest estimates of value by which the history of thought has hitherto been governed, misunderstandings of the bodily constitution, either of individuals, classes, or entire races are concealed. One may always primarily consider these audacious freaks of metaphysic, and especially its answers to the question of the _worth_ of existence, as symptoms of certain bodily constitutions; and if, on the whole, when scientifically determined, not a particle of significance attaches to such affirmations and denials of the world, they nevertheless furnish the historian and psychologist with hints so much the more valuable (as we have said) as symptoms of the bodily constitution, its good or bad condition, its fullness, powerfulness, and sovereignty in history; or else of its obstructions, exhaustions, and impoverishments, its premonition of the end, its will to the end. I still expect that a philosophical _physician,_ in the exceptional sense of the word--one who applies himself to the problem of the collective health of peoples, periods, races, and mankind generally--will some day have the courage to follow out my suspicion to its ultimate conclusions, and to venture on the judgment that in all philosophising it has not hitherto been a question of "truth" at all, but of something else,--namely, of health, futurity, growth, power, life....

3.

It will be surmised that I should not like to take leave ungratefully of that period of severe sickness, the advantage of which is not even yet exhausted in me: for I am sufficiently conscious of what I have in advance of the spiritually robust generally, in my changeful state of health. A philosopher who has made the tour of many states of health, and always makes it anew, has also gone through just as many philosophies: he really _cannot_ do otherwise than transform his condition on every occasion into the most ingenious posture and position,--this art of transfiguration _is_ just philosophy. We philosophers are not at liberty to separate soul and body, as the people separate them; and we are still less at liberty to separate soul and spirit. We are not thinking frogs, we are not objectifying and registering apparatuses with cold entrails,--our thoughts must be continually born to us out of our pain, and we must, motherlike, share with them all that we have in us of blood, heart, ardour, joy, passion, pang, conscience, fate and fatality. Life--that means for us to transform constantly into light and flame all that we are, and also all that we meet with; we _cannot_ possibly do otherwise. And as regards sickness, should we not be almost tempted to ask whether we could in general dispense with it? It is great pain only which is the ultimate emancipator of the spirit; for it is the teacher of the _strong suspicion_ which makes an X out of every U[1], a true, correct X, _i.e.,_ the ante-penultimate letter.... It is great pain only, the long slow pain which takes time, by which we are burned as it were with green wood, that compels us philosophers to descend into our ultimate depths, and divest ourselves of all trust, all good-nature, veiling, gentleness, and averageness, wherein we have perhaps formerly installed our humanity. I doubt whether such pain "improves" us; but I know that it _deepens_ us. Be it that we learn to confront it with our pride, our scorn, our strength of will, doing like the Indian who, however sorely tortured, revenges himself on his tormentor with his bitter tongue; be it that we withdraw from the pain into the oriental nothingness--it is called Nirvana,--into mute, benumbed, deaf self-surrender, self-forgetfulness, and self-effacement: one emerges from such long, dangerous exercises in self-mastery as another being, with several additional notes of interrogation, and above all, with the _will_ to question more than ever, more profoundly, more strictly, more sternly, more wickedly, more quietly than has ever been questioned hitherto. Confidence in life is gone: life itself has become a _problem._--Let it not be imagined that one has necessarily become a hypochondriac thereby! Even love of life is still possible--only one loves differently. It is the love of a woman of whom one is doubtful.... The charm, however, of all that is problematic, the delight in the X, is too great in those more spiritual and more spiritualised men, not to spread itself again and

again like a clear glow over all the trouble of the problematic, over all the danger of uncertainty, and even over the jealousy of the lover. We know a new happiness....

4.

Finally (that the most essential may not remain unsaid), one comes back out of such abysses, out of such severe sickness, and out of the sickness of strong suspicion--_new-born,_ with the skin cast; more sensitive, more wicked, with a finer taste for joy, with a more delicate tongue for all good things, with a merrier disposition, with a second and more dangerous innocence in joy; more childish at the same time, and a hundred times more refined than ever before. Oh, how repugnant to us now is pleasure, coarse, dull, drab pleasure, as the pleasure-seekers, our "cultured" classes, our rich and ruling classes, usually understand it! How malignantly we now listen to the great holiday-hubbub with which "cultured people" and city-men at present allow themselves to be forced to "spiritual enjoyment" by art, books, and music, with the help of spirituous liquors! How the theatrical cry of passion now pains our ear, how strange to our taste has all the romantic riot and sensuous bustle which the cultured populace love become (together with their aspirations after the exalted, the elevated, and the intricate)! No, if we convalescents need an art at all, it is _another_ art--a mocking, light, volatile, divinely serene, divinely ingenious art, which blazes up like a clear flame, into a cloudless heaven! Above all, an art for artists, only for artists! We at last know better what is first of all necessary _for it--_namely, cheerfulness, _every_ kind of cheerfulness, my friends! also as artists:--I should like to prove it. We now know something too well, we men of knowledge: oh, how well we are now learning to forget and _not_ know, as artists! And as to our future, we are not likely to be found again in the tracks of those Egyptian youths who at night make the temples unsafe, embrace statues, and would fain unveil, uncover, and put in clear light, everything which for good reasons is kept concealed[2]. No, we have got disgusted with this bad taste, this will to truth, to "truth at all costs," this youthful madness in the love of truth: we are now too experienced, too serious, too joyful, too singed, too profound for that.... We no longer believe that truth remains truth when the veil is withdrawn from it: we have lived long enough to believe this. At present we regard it as a matter of propriety not to be anxious either to see everything naked, or to be present at everything, or to understand and "know" everything. "Is it true that the good God is everywhere present?" asked a little girl of her mother: "I think that is indecent":--a hint to philosophers! One should have more reverence for the _shame-facedness_ with which nature has concealed herself behind enigmas and motley uncertainties. Perhaps truth is a woman who has reasons for not showing her reasons? Perhaps her name is Baubo, to speak in Greek?... Oh, those Greeks! They knew how _to live:_ for that purpose it is necessary to keep bravely to the surface, the fold and the skin; to worship appearance, to believe in forms, tones, and words, in the whole Olympus of appearance! Those Greeks were superficial--_from profundity!_ And are we not coming back precisely to this point, we dare-devils of the spirit, who have scaled the highest and most dangerous peak of contemporary thought, and have looked around us from it, have _looked down_ from it? Are we not precisely in this respect--Greeks? Worshippers of forms, of tones, and of words? And precisely on that account--artists?

RUTA, near GENOA _Autumn,_ 1886.

[1] This means literally to put the numeral X instead of the numeral V (formerly U); hence it means to double a number unfairly, to exaggerate, humbug, cheat.--TR.

[2] An allusion to Schiller's poem: "The Veiled Image of Sais."--TR.

JEST, RUSE AND REVENGE.

A PRELUDE IN RHYME.

1.

Invitation.

Venture, comrades, I implore you, On the fare I set before you, You will like it more to-morrow, Better still the following day: If yet more you're then requiring, Old success I'll find inspiring, And fresh courage thence will borrow Novel dainties to display.

2.

My Good Luck.

Weary of Seeking had I grown, So taught myself the way to Find: Back by the storm I once was blown, But follow now, where drives the wind.

3.

Undismayed.

Where you're standing, dig, dig out: Down below's the Well: Let them that walk in darkness shout: "Down below--there's Hell!"

4.

Dialogue.

_A._ Was I ill? and is it ended? Pray, by what physician tended? I recall no pain endured!

_B._ Now I know your trouble's ended: He that can forget, is cured.

5.

To the Virtuous.

Let our virtues be easy and nimble-footed in motion, Like unto Homer's verse ought they to come _and to go_.

6.

Worldly Wisdom.

Stay not on level plain, Climb not the mount too high. But half-way up remain-- The world you'll best descry!

7.

Vademecum--Vadetecum.

Attracted by my style and talk You'd follow, in my footsteps walk? Follow yourself unswervingly, So--careful!--shall you follow me.

8.

The Third Sloughing

My skin bursts, breaks for fresh rebirth, And new desires come thronging: Much I've devoured, yet for more earth The serpent in me's longing. 'Twixt stone and grass I crawl once more, Hungry, by crooked ways, To eat the food I ate before, Earth-fare all serpents praise!

9.

My Roses.

My luck's good--I'd make yours fairer, (Good luck ever needs a sharer), Will you stop and pluck my roses?

Oft mid rocks and thorns you'll linger, Hide and stoop, suck bleeding finger-- Will you stop and pluck my roses?

For my good luck's a trifle vicious, Fond of teasing, tricks malicious-- Will you stop and pluck my roses?

10.

The Scorner.

Many drops I waste and spill, So my scornful mood you curse: Who to brim his cup doth fill, Many drops _must_ waste and spill-- Yet he thinks the wine no worse.

11.

The Proverb Speaks.

Harsh and gentle, fine and mean, Quite rare and common, dirty and clean, The fools' and the sages' go-between: All this I will be, this have been, Dove and serpent and swine, I ween!

12.

To a Lover of Light.

That eye and sense be not fordone E'en in the shade pursue the sun!

13.

For Dancers.

Smoothest ice, A paradise To him who is a dancer nice.

14.

The Brave Man.

A feud that knows not flaw nor break, Rather then patched-up friendship, take.

15.

Rust.

Rust's needed: keenness will not satisfy! "He is too young!" the rabble loves to cry.

16.

Excelsior.

"How shall I reach the top?" No time For thus reflecting! Start to climb!

17.

The Man of Power Speaks. Ask never! Cease that whining, pray! Take without asking, take alway!

18.

Narrow Souls.

Narrow souls hate I like the devil, Souls wherein grows nor good nor evil.

19.

Accidentally a Seducer[1]

He shot an empty word Into the empty blue; But on the way it met A woman whom it slew.

20.

For Consideration.

A twofold pain is easier far to bear Than one: so now to suffer wilt thou dare?

21.

Against Pride.

Brother, to puff thyself up ne'er be quick: For burst thou shalt be by a tiny prick!

22.

Man and Woman.

"The woman seize, who to thy heart appeals!" Man's motto: woman seizes not, but steals.

23.

Interpretation.

If I explain my wisdom, surely 'Tis but entangled more securely, I can't expound myself aright: But he that's boldly up and doing, His own unaided course pursuing, Upon my image casts more light!

24.

A Cure for Pessimism.

Those old capricious fancies, friend! You say your palate naught can please, I hear you bluster, spit and wheeze, My love, my patience soon will end! Pluck up your courage, follow me-- Here's a fat toad! Now then, don't blink, Swallow it whole, nor pause to think! From your dyspepsia you'll be free!

25.

A Request.

Many men's minds I know full well, Yet what mine own is, cannot tell. I cannot see--my eye's too near-- And falsely to myself appear. 'Twould be to me a benefit Far from myself if I could sit, Less distant than my enemy, And yet my nearest friend's too nigh-- 'Twixt him and me, just in the middle! What do I ask for? Guess my riddle.

26.

My Cruelty.

I must ascend an hundred stairs, I must ascend: the herd declares I'm cruel: "Are we made of stone?" I must ascend an hundred stairs: All men the part of stair disown.

27.

The Wanderer.

"No longer path! Abyss and silence chilling!" Thy fault! To leave the path thou wast too willing! Now comes the test! Keep cool--eyes bright and clear! Thou'rt lost for sure, if thou permittest--fear.

28.

Encouragement for Beginners.

See the infant, helpless creeping-- Swine around it grunt swine-talk-- Weeping always, naught but weeping, Will it ever learn to walk? Never fear! Just wait, I swear it Soon to dance will be inclined, And this babe, when two legs bear it, Standing on its head you'll find.

29.

Planet Egoism.

Did I not turn, a rolling cask, Ever about myself, I ask, How could I without burning run Close on the track of the hot sun?

30.

The Neighbour.

Too nigh, my friend my joy doth mar, I'd have him high above and far, Or how can he become my star?

31.

The Disguised Saint.

Lest we for thy bliss should slay thee, In devil's wiles thou dost array thee, Devil's wit and devil's dress. But in vain! Thy looks betray thee And proclaim thy holiness.

32.

The Slave.

_A._ He stands and listens: whence his pain? What smote his ears? Some far refrain? Why is his heart with anguish torn?

_B._ Like all that fetters once have worn, He always hears the clinking--chain!

33.

The Lone One.

I hate to follow and I hate to lead. Obedience? no! and ruling? no, indeed! Wouldst fearful be in others' sight? Then e'en _thyself_ thou must affright: The people but the Terror's guidance heed. I hate to guide myself, I hate the fray. Like the wild beasts I'll wander far afield. In Error's pleasing toils I'll roam Awhile, then lure myself back home, Back home, and--to my self-seduction yield.

34.

Seneca et hoc Genus omne.

They write and write (quite maddening me) Their "sapient" twaddle airy, As if 'twere _primum scribere,_ _Deinde philosophari._

35.

Ice.

Yes! I manufacture ice: Ice may help you to digest: If you _had_ much to digest, How you would enjoy my ice!

36.

Youthful Writings.

My wisdom's A and final O Was then the sound that smote mine ear. Yet now it rings no longer so, My youth's eternal Ah! and Oh! Is now the only sound I hear.[2]

37.

Foresight.

In yonder region travelling, take good care! An hast thou wit, then be thou doubly ware! They'll smile and lure thee; then thy limbs they'll tear: Fanatics' country this where wits are rare!

38.

The Pious One Speaks.

God loves us, _for_ he made us, sent us here!-- "Man hath made God!" ye subtle ones reply. His handiwork he must hold dear, And _what he made_ shall he deny? There sounds the devil's halting hoof, I fear.

39.

In Summer.

In sweat of face, so runs the screed, We e'er must eat our bread, Yet wise physicians if we heed "Eat naught in sweat," 'tis said. The dog-star's blinking: what's his need? What tells his blazing sign? In sweat of face (so runs _his_ screed) We're meant to drink

our wine!

40.

Without Envy.

His look betrays no envy: and ye laud him? He cares not, asks not if your throng applaud him! He has the eagle's eye for distance far, He sees you not, he sees but star on star!

41.

Heraclitism.

Brethren, war's the origin Of happiness on earth: Powder-smoke and battle-din Witness friendship's birth! Friendship means three things, you know,-- Kinship in luckless plight, Equality before the foe Freedom--in death's sight!

42.

Maxim of the Over-refined.

"Rather on your toes stand high Than crawl upon all fours, Rather through the keyhole spy Than through the open doors!"

43.

Exhortation.

Renown you're quite resolved to earn? My thought about it Is this: you need not fame, must learn To do without it!

44.

Thorough.

I an inquirer? No, that's not my calling Only _I weigh a lot_--I'm such a lump!-- And through the waters I keep falling, falling, Till on the ocean's deepest bed I bump.

45.

The Immortals. "To-day is meet for me, I come to-day," Such is the speech of men foredoomed to stay. "Thou art too soon," they cry, "thou art too late," What care the Immortals what the rabble say?

46.

Verdicts of the Weary.

The weary shun the glaring sun, afraid, And only care for trees to gain the shade.

47.

Descent.

"He sinks, he falls," your scornful looks portend: The truth is, to your level he'll descend. His Too Much Joy is turned to weariness, His Too Much Light will in your darkness end.

48.

Nature Silenced[3] Around my neck, on chain of hair, The timepiece hangs--a sign of care. For me the starry course is o'er, No sun and shadow as before, No cockcrow summons at the door, For nature tells the time no more! Too many clocks her voice have drowned, And droning law has dulled her sound.

49.

The Sage Speaks.

Strange to the crowd, yet useful to the crowd, I still pursue my path, now sun, now cloud, But always pass above the crowd!

50.

He lost his Head....

She now has wit--how did it come her way? A man through her his reason lost, they say. His head, though wise ere to this pastime lent, Straight to the devil--no, to woman went!

51.

A Pious Wish.

"Oh, might all keys be lost! 'Twere better so And in all keyholes might the pick-lock go!" Who thus reflects ye may as--picklock know.

52.

Foot Writing.

I write not with the hand alone, My foot would write, my foot that capers, Firm, free and bold, it's marching on Now through the fields, now through the papers.

53.

"_Human, All-too-Human._" ...

Shy, gloomy, when your looks are backward thrust, Trusting the future where yourself you trust, Are you an eagle, mid the nobler fowl, Or are you like Minerva's darling owl?

54.

To my Reader.

Good teeth and a digestion good I wish you--these you need, be sure! And, certes, if my book you've stood, Me with good humour you'll endure.

55.

The Realistic Painter.

"To nature true, complete!" so he begins. Who complete Nature to his canvas _wins?_ Her tiniest fragment's endless, no constraint Can know: he paints just what his _fancy_ pins: What does his fancy pin? What he _can_ paint!

56.

Poets' Vanity.

Glue, only glue to me dispense, The wood I'll find myself, don't fear! To give four senseless verses sense-- That's an achievement I revere!

57.

Taste in Choosing.

If to choose my niche precise Freedom I could win from fate, I'd be in midst of Paradise-- Or, sooner still--before the gate!

58.

The Crooked Nose.

Wide blow your nostrils, and across The land your nose holds haughty sway: So you, unhorned rhinoceros, Proud mannikin, fall forward aye! The one trait with the other goes: A straight pride and a crooked nose.

59.

The Pen is Scratching....

The pen is scratching: hang the pen! To scratching I'm condemned to sink! I grasp the inkstand fiercely then And write in floods of flowing ink. How broad, how full the stream's career! What luck my labours doth requite! 'Tis true, the writing's none too clear-- What then? Who reads the stuff I write?

60.

Loftier Spirits.

This man's climbing up--let us praise him-- But that other we love From aloft doth eternally move, So above even praise let us raise him, He _comes_ from above!

61.

The Sceptic Speaks.

Your life is half-way o'er; The clock-hand moves; your soul is thrilled with fear, It roamed to distant shore And sought and found not, yet you--linger here!

Your life is half-way o'er; That hour by hour was pain and error sheer: _Why stay?_ What seek you more? "That's what I'm seeking--reasons why I'm here!"

62.

Ecce Homo.

Yes, I know where I'm related, Like the flame, unquenched, unsated, I consume myself and glow: All's turned to light I lay my hand on, All to coal that I abandon, Yes, I am a flame, I know!

63.

Star Morality[4]

Foredoomed to spaces vast and far, What matters darkness to the star?

Roll calmly on, let time go by, Let sorrows pass thee--nations die!

Compassion would but dim the light That distant worlds will gladly sight.

To thee one law--be pure and bright!

[1] Translated by Miss M. D. Petre.

[2] A and O, suggestive of Ah! and Oh! refer of course to Alpha and Omega, the first and last letters of the Greek alphabet.--TR.

[3] Translated by Miss M. D. Petre.

[4] Translated by Miss M. D. Petre.

BOOK FIRST

1.

_The Teachers of the Object of Existence.--_Whether I look with a good or an evil eye upon men, I find them always at one problem, each and all of them: to do that which conduces to the conservation of the human species. And certainly not out of any

sentiment of love for this species, but simply because nothing in them is older, stronger, more inexorable and more unconquerable than that instinct,--because it is precisely _the essence_ of our race and herd. Although we are accustomed readily enough, with our usual short-sightedness, to separate our neighbours precisely into useful and hurtful, into good and evil men, yet when we make a general calculation, and reflect longer on the whole question, we become distrustful of this defining and separating, and finally leave it alone. Even the most hurtful man is still perhaps, in respect to the conservation of the race, the most useful of all; for he conserves in himself, or by his effect on others, impulses without which mankind might long ago have languished or decayed. Hatred, delight in mischief, rapacity and ambition, and whatever else is called evil--belong to the marvellous economy of the conservation of the race; to be sure a costly, lavish, and on the whole very foolish economy:--which has, however, hitherto preserved our race, _as is demonstrated to us._ I no longer know, my dear fellow-man and neighbour, if thou _canst_ at all live to the disadvantage of the race, and therefore, "unreasonably" and "badly"; that which could have injured the race has perhaps died out many millenniums ago, and now belongs to the things which are no longer possible even to God. Indulge thy best or thy worst desires, and above all, go to wreck!--in either case thou art still probably the furtherer and benefactor of mankind in some way or other, and in that respect thou mayest have thy panegyrists--and similarly thy mockers! But thou wilt never find him who would be quite qualified to mock at thee, the individual, at thy best, who could bring home to thy conscience its limitless, buzzing and croaking wretchedness so as to be in accord with truth! To laugh at oneself as one would have to laugh in order to laugh _out of the veriest truth,_--to do this, the best have not hitherto had enough of the sense of truth, and the most endowed have had far too little genius! There is perhaps still a future even for laughter! When the maxim, "The race is all, the individual is nothing,"--has incorporated itself in humanity, and when access stands open to every one at all times to this ultimate emancipation and irresponsibility.--Perhaps then laughter will have united with wisdom, perhaps then there will be only "joyful wisdom." Meanwhile, however, it is quite otherwise, meanwhile the comedy of existence has not yet "become conscious" of itself, meanwhile it is still the period of tragedy, the period of morals and religions. What does the ever new appearing of founders of morals and religions, of instigators of struggles for moral valuations, of teachers of remorse of conscience and religious war, imply? What do these heroes on this stage imply? For they have hitherto been the heroes of it, and all else, though solely visible for the time being, and too close to one, has served only as preparation for these heroes, whether as machinery and coulisse, or in the rôle of confidants and valets. (The poets, for example, have always been the valets of some morality or other.)--It is obvious of itself that these tragedians also work in the interest of the _race,_ though they may believe that they work in the interest of God, and as emissaries of God. They also further the life of the species, _in that they further the belief in life._ "It is worthwhile to live"--each of them calls out,--"there is something of importance in this life; life has something behind it and under it; take care!" That impulse, which rules equally in the noblest and the ignoblest, the impulse to the conservation of the species, breaks forth from time to time as reason and passion of spirit; it has then a brilliant train of motives about it, and tries with all its power to make us forget that fundamentally it is just impulse, instinct, folly and baselessness. Life _should_ beloved, _for_...! Man _should_ benefit himself and his neighbour, _for_...! And whatever all these _shoulds_ and _fors_ imply, and may imply in future! In order that that which necessarily and always happens of itself and without design, may henceforth appear to be done by design, and may appeal to men as reason and ultimate command,--for that purpose the ethiculturist comes forward as the teacher of design in existence; for that purpose he devises a second and different existence, and by means of this new mechanism he lifts the old common existence off its old common hinges. No! he does not at all want us to _laugh_ at existence, nor even at ourselves--nor at himself; to him an individual is always an individual, something first and last and immense, to him there are no species, no sums, no noughts. However foolish and fanatical his inventions and valuations may be, however much he may misunderstand the course of nature and deny its conditions--and all systems of ethics hitherto have been foolish and anti-natural to such a degree that mankind would have been ruined by any one of them had it got the upper hand,--at any rate, every time that "the hero" came upon the stage something new was attained: the frightful counterpart of laughter, the profound convulsion of many individuals at the thought, "Yes, it is worth while to live! yes, I am worthy to live!"--life, and thou, and I, and all of us together became for a while _interesting_ to ourselves once more.--It is not to be denied that hitherto laughter and reason and nature have _in the long run_ got the upper hand of all the great teachers of design: in the end the short tragedy always passed over once more into the eternal comedy of existence; and the "waves of innumerable laughters"--to use the expression of Æschylus--must also in the end beat over the greatest of these tragedies. But with all this corrective laughter, human nature has on the whole been changed by the ever new appearance of those teachers of the design of existence,--human nature has now an additional requirement, the very requirement of the ever new appearance of such teachers and doctrines of "design." Man has gradually become a visionary animal, who has to fulfil one more condition of existence than the other animals: man _must_ from time to time believe that he knows _why_ he exists; his species cannot flourish without periodically confiding in life! Without the belief in _reason in life!_ And always from time to time will the human race decree anew that "there is something which really may not be laughed at." And the most clairvoyant philanthropist will add that "not only laughing and joyful

wisdom, but also the tragic with all its sublime irrationality, counts among the means and necessities for the conservation of the race!"--And consequently! Consequently! Consequently! Do you understand me, oh my brothers? Do you understand this new law of ebb and flow? We also shall have our time!

2.

The Intellectual Conscience.--I have always the same experience over again, and always make a new effort against it; for although it is evident to me I do not want to believe it: _in the greater number of men the intellectual conscience is lacking;_ indeed, it would often seem to me that in demanding such a thing, one is as solitary in the largest cities as in the desert. Everyone looks at you with strange eyes and continues to make use of his scales, calling this good and that bad; and no one blushes for shame when you remark that these weights are not the full amount,--there is also no indignation against you; perhaps they laugh at your doubt. I mean to say that _the greater number of people_ do not find it contemptible to believe this or that, and live according to it, _without_ having been previously aware of the ultimate and surest reasons for and against it, and without even giving themselves any trouble about such reasons afterwards,--the most Sifted men and the noblest women still belong to this "greater number." But what is kind-heartedness, refinement and genius to me, if he who has these virtues harbours indolent sentiments in belief and judgment, if _the longing for certainty_ does not rule in him, as his innermost desire and profoundest need--as that which separates higher from lower men! In certain pious people I have found a hatred of reason, and have been favourably disposed to them for it: their bad intellectual conscience at least still betrayed itself in this manner! But to stand in the midst of this _rerum concordia discors_ and all the marvellous uncertainty and ambiguity of existence, _and not to question,_ not to tremble with desire and delight in questioning, not even to hate the questioner--perhaps even to make merry over him to the extent of weariness--that is what I regard as _contemptible,_ and it is this sentiment which I first of all search for in every one--some folly or other always persuades me anew that every man has this sentiment, as man. This is my special kind of unrighteousness.

3.

Noble and Ignoble.--To ignoble natures all noble, magnanimous sentiments appear inexpedient, and on that account first and foremost, as incredible: they blink with their eyes when they hear of such matters, and seem inclined to say," there will, no doubt, be some advantage therefrom, one cannot see through all walls;"--they are jealous of the noble person, as if he sought advantage by back-stair methods. When they are all too plainly convinced of the absence of selfish intentions and emoluments, the noble person is regarded by them as a kind of fool: they despise him in his gladness, and laugh at the lustre of his eye. "How can a person rejoice at being at a disadvantage, how can a person with open eyes want to meet with disadvantage! It must be a disease of the reason with which the noble affection is associated";--so they think, and they look depreciatingly thereon; just as they depreciate the joy which the lunatic derives from his fixed idea. The ignoble nature is distinguished by the fact that it keeps its advantage steadily in view, and that this thought of the end and advantage is even stronger than its strongest impulse: not to be tempted to inexpedient activities by its impulses--that is its wisdom and inspiration. In comparison with the ignoble nature the higher nature is _more irrational:_--for the noble, magnanimous, and self-sacrificing person succumbs in fact to his impulses, and in his best moments his reason _lapses_ altogether. An animal, which at the risk of life protects its young, or in the pairing season follows the female where it meets with death, does not think of the risk and the death; its reason pauses likewise, because its delight in its young, or in the female, and the fear of being deprived of this delight, dominate it exclusively; it becomes stupider than at other times, like the noble and magnanimous person. He possesses feelings of pleasure and pain of such intensity that the intellect must either be silent before them, or yield itself to their service: his heart then goes into his head, and one henceforth speaks of "passions." (Here and there to be sure, the antithesis to this, and as it were the "reverse of passion," presents itself; for example in Fontenelle, to whom some one once laid the hand on the heart with the words, "What you have there, my dearest friend, is brain also.") It is the unreason, or perverse reason of passion, which the ignoble man despises in the noble individual, especially when it concentrates upon objects whose value appears to him to be altogether fantastic and arbitrary. He is offended at him who succumbs to the passion of the belly, but he understands the allurement which here plays the tyrant; but he does not understand, for example, how a person out of love of knowledge can stake his health and honour on the game. The taste of the higher nature devotes itself to exceptional matters, to things which usually do not affect people, and seem to have no sweetness; the higher nature has a singular standard of value. Yet it is mostly of the belief that it has _not_ a singular standard of value in its idiosyncrasies of taste; it rather sets up its values and non-values as the generally valid values and non-values, and thus becomes incomprehensible and impracticable. It is very rarely that a higher nature has so much reason over and above as to understand and deal with everyday men as such; for the most part it believes in its passion as if it were the concealed passion of every one, and precisely in this belief it is full of ardour and eloquence. If then such exceptional men do not perceive themselves as exceptions,

how can they ever understand the ignoble natures and estimate average men fairly! Thus it is that they also speak of the folly, inexpediency and fantasy of mankind, full of astonishment at the madness of the world, and that it will not recognise the "one thing needful for it."--This is the eternal unrighteousness of noble natures.

4.

_That which Preserves the Species.--_The strongest and most evil spirits have hitherto advanced mankind the most: they always rekindled the sleeping passions--all orderly arranged society lulls the passions to sleep; they always reawakened the sense of comparison, of contradiction, of delight in the new, the adventurous, the untried; they compelled men to set opinion against opinion, ideal plan against ideal plan. By means of arms, by upsetting boundary-stones, by violations of piety most of all: but also by new religions and morals! The same kind of "wickedness" is in every teacher and preacher of the _new--_which makes a conqueror infamous, although it expresses itself more refinedly, and does not immediately set the muscles in motion (and just on that account does not make so infamous!) The new, however, is under all circumstances the _evil,_ as that which wants to conquer, which tries to upset the old boundary-stones and the old piety; only the old is the good! The good men of every age are those who go to the roots of the old thoughts and bear fruit with them, the agriculturists of the spirit. But every soil becomes finally exhausted, and the ploughshare of evil must always come once more.--There is at present a fundamentally erroneous theory of morals which is much celebrated, especially in England: according to it the judgments "good" and "evil" are the accumulation of the experiences of that which is "expedient" and "inexpedient"; according to this theory, that which is called good is conservative of the species, what is called evil, however, is detrimental to it. But in reality the evil impulses are just in as high a degree expedient, indispensable, and conservative of the species as the good:--only, their function is different.

5.

Unconditional Duties.--All men who feel that they need the strongest words and intonations, the most eloquent gestures and attitudes, in order to operate _at all_--revolutionary politicians, socialists, preachers of repentance with or without Christianity, with all of whom there must be no mere half-success,--all these speak of "duties," and indeed, always of duties, which have the character of being unconditional--without such they would have no right to their excessive pathos: they know that right well! They grasp, therefore, at philosophies of morality which preach some kind of categorical imperative, or they assimilate a good lump of religion, as, for example, Mazzini did. Because they want to be trusted unconditionally, it is first of all necessary for them to trust themselves unconditionally, on the basis of some ultimate, undebatable command, sublime in itself, as the ministers and instruments of which, they would fain feel and announce themselves. Here we have the most natural, and for the most part, very influential opponents of moral enlightenment and scepticism: but they are rare. On the other hand, there is always a very numerous class of those opponents wherever interest teaches subjection, while repute and honour seem to forbid it. He who feels himself dishonoured at the thought of being the _instrument_ of a prince, or of a party and sect, or even of wealthy power (for example, as the descendant of a proud, ancient family), but wishes just to be this instrument, or must be so before himself and before the public--such a person has need of pathetic principles which can at all times be appealed to:--principles of an unconditional _ought,_ to which a person can subject himself without shame, and can show himself subjected. All more refined servility holds fast to the categorical imperative, and is the mortal enemy of those who want to take away the unconditional character of duty: propriety demands this from them, and not only propriety.

6.

_Loss of Dignity.--_Meditation has lost all its dignity of form; the ceremonial and solemn bearing of the meditative person have been made a mockery, and one would no longer endure a wise man of the old style. We think too hastily and on the way and while walking and in the midst of business of all kinds, even when we think on the most serious matters; we require little preparation, even little quiet:--it is as if each of us carried about an unceasingly revolving machine in his head, which still works, even under the most unfavourable circumstances. Formerly it was perceived in a person that on some occasion he wanted to think--it was perhaps the exception!--that he now wanted to become wiser and collected his mind on a thought: he put on a long face for it, as for a prayer, and arrested his step-nay, stood still for hours on the street when the thought "came"--on one or on two legs. It was thus "worthy of the affair"!

7.

_Something for the Laborious.--_He who at present wants to make moral questions a subject of study has an immense field of labour before him. All kinds of passions must be thought about singly, and followed singly throughout periods, peoples, great and insignificant individuals; all their rationality, all their valuations and elucidations of things, ought to come to light! Hitherto all that has given colour to existence has lacked a history: where would one find a history of love, of avance, of envy, of conscience, of piety, of cruelty? Even a comparative history of law, as also of punishment, has hitherto been completely lacking. Have the different divisions of the day, the consequences of a regular appointment of the times for labour, feast, and repose, ever been made the object of investigation? Do we know the moral effects of the alimentary substances? Is there a philosophy of nutrition? (The ever-recurring outcry for and against vegetarianism proves that as yet there is no such philosophy!) Have the experiences with regard to communal living, for example, in monasteries, been collected? Has the dialectic of marriage and friendship been set forth? The customs of the learned, of trades-people, of artists, and of mechanics--have they already found their thinkers? There is so much to think of thereon! All that up till now has been considered as the "conditions of existence," of human beings, and all reason, passion and superstition in this consideration--have they been investigated to the end? The observation alone of the different degrees of development which the human impulses have attained, and could yet attain, according to the different moral climates, would furnish too much work for the most laborious; whole generations, and regular co-operating generations of the learned, would be needed in order to exhaust the points of view and the material here furnished. The same is true of the determining of the reasons for the differences of the moral climates ("_on what account_ does this sun of a fundamental moral judgment and standard of highest value shine here--and that sun there?"). And there is again a new labour which points out the erroneousness of all these reasons, and determines the entire essence of the moral judgments hitherto made. Supposing all these labours to be accomplished, the most critical of all questions would then come into the foreground: whether science is in a position to _furnish_ goals for human action, after it has proved that it can take them away and annihilate them--and then would be the time for a process of experimenting, in which every kind of heroism could satisfy itself, an experimenting for centuries, which would put into the shade all the great labours and sacrifices of previous history. Science has not hitherto built its Cyclopic structures; for that also the time will come.

8.

_Unconscious Virtues.--_All qualities in a man of which he is conscious--and especially when he presumes that they are visible and evident to his environment also--are subject to quite other laws of development than those qualities which are unknown to him, or imperfectly known, which by their subtlety can also conceal themselves from the subtlest observer, and hide as it were behind nothing--as in the case of the delicate sculptures on the scales of reptiles (it would be an error to suppose them an adornment or a defence--for one sees them only with the microscope; consequently, with an eye artificially strengthened to an extent of vision which similar animals, to which they might perhaps have meant adornment or defence, do not possess!). Our visible moral qualities, and especially our moral qualities _believed to be_ visible, follow their own course,--and our invisible qualities of similar name, which in relation to others neither serve for adornment nor defence, _also follow their own course:_ quite a different course probably, and with lines and refinements, and sculptures, which might perhaps give pleasure to a God with a divine microscope. We have, for example, our diligence, our ambition, our acuteness: all the world knows about them,--and besides, we have probably once more _our_ diligence, _our_ ambition, _our_ acuteness; but for these--our reptile scales--the microscope has not yet been invented!--And here the adherents of instinctive morality will say, "Bravo! He at least regards unconscious virtues as possible--that suffices us!"--Oh, ye unexacting creatures!

9.

Our Eruptions.--Numberless things which humanity acquired in its earlier stages, but so weakly and embryonically that it could not be noticed that they were acquired, are thrust suddenly into light long afterwards, perhaps after the lapse of centuries: they have in the interval become strong and mature. In some ages this or that talent, this or that virtue seems to be entirely lacking, as it--is in some men; but let us wait only for the grandchildren and grandchildren's children, if we have time to wait,--they bring the interior of their grandfathers into the sun, that interior of which the grandfathers themselves were unconscious. The son, indeed, is often the betrayer of his father; the latter understands himself better since he has got his son. We have all hidden gardens and plantations in us; and by another simile, we are all growing volcanoes, which will have their hours of eruption:--how near or how distant this is, nobody of course knows, not even the good God.

10.

A Species of Atavism.--I like best to think of the rare men of an age as suddenly emerging after-shoots of past cultures, and of their persistent strength: like the atavism of a people and its civilisation --there is thus still something in them to _think of!_ They now seem strange, rare, and extraordinary: and he who feels these forces in himself has to foster them in face of a different, opposing world; he has to defend them, honour them, and rear them to maturity: and he either becomes a great man thereby, or a deranged and eccentric person, if he does not altogether break down betimes. Formerly these rare qualities were usual, and were consequently regarded as common: they did not distinguish people. Perhaps they were demanded and presupposed; it was impossible to become great with them, for indeed there was also no danger of becoming insane and solitary with them.--It is principally in the _old-established_ families and castes of a people that such after-effects of old impulses present themselves, while there is no probability of such atavism where races, habits, and valuations change too rapidly. For the _tempo_ of the evolutional forces in peoples implies just as much as in music; for our case an _andante_ of evolution is absolutely necessary, as the _tempo_ of a passionate and slow spirit:--and the spirit of conserving families is certainly of _that_ sort.

11.

Consciousness.--Consciousness is the last and latest development of the organic, and consequently also the most unfinished and least powerful of these developments. Innumerable mistakes originate out of consciousness, which, "in spite of fate," as Homer says, cause an animal or a man to break down earlier than might be necessary. If the conserving bond of the instincts were not very much more powerful, it would not generally serve as a regulator: by perverse judging and dreaming with open eyes, by superficiality and credulity, in short, just by consciousness, mankind would necessarily have broken down: or rather, without the former there would long ago have been nothing more of the latter! Before a function is fully formed and matured, it is a danger to the organism: all the better if it be then thoroughly tyrannised over! Consciousness is thus thoroughly tyrannised over--and not least by the pride in it! It is thought that here is _the quintessence_ of man; that which is enduring, eternal, ultimate, and most original in him! Consciousness is regarded as a fixed, given magnitude! Its growth and intermittences are denied! It is accepted as the "unity of the organism"!--This ludicrous overvaluation and misconception of consciousness has as its result the great utility that a too rapid maturing of it has thereby been _hindered._ Because men believed that they already possessed consciousness, they gave themselves very little trouble to acquire it--and even now it is not otherwise! It is still an entirely new _problem_ just dawning on the human eye, and hardly yet plainly recognisable: _to embody knowledge in ourselves_ and make it instinctive,--a problem which is only seen by those who have grasped the fact that hitherto our _errors_ alone have been embodied in us, and that all our consciousness is relative to errors!

12.

_The Goal of Science.--_What? The ultimate goal of science is to create the most pleasure possible to man, and the least possible pain? But what if pleasure and pain should be so closely connected that he who _wants_ the greatest possible amount of the one _must_ also have the greatest possible amount of the other,--that he who wants to experience the "heavenly high jubilation,"[1] must also be ready to be "sorrowful unto death"?[2] And it is so, perhaps! The Stoics at least believed it was so, and they were consistent when they wished to have the least possible pleasure, in order to have the least possible pain from life. (When one uses the expression: "The virtuous man is the happiest," it is as much the sign-board of the school for the masses, as a casuistic subtlety for the subtle.) At present also ye have still the choice: either the _least possible pain,_ in short painlessness--and after all, socialists and politicians of all parties could not honourably promise more to their people,--or the _greatest possible amount of pain,_ as the price of the growth of a fullness of refined delights and enjoyments rarely tasted hitherto! If ye decide for the former, if ye therefore want to depress and minimise man's capacity for pain, well, ye must also depress and minimise his _capacity for enjoyment._ In fact, one can further the one as well as the other goal _by science!_ Perhaps science is as yet best known by its capacity for depriving man of enjoyment, and making him colder, more statuesque, and more Stoical. But it might also turn out to be the _great pain-bringer!_--And then, perhaps, its counteracting force would be discovered simultaneously, its immense capacity for making new sidereal worlds of enjoyment beam forth!

[1] Allusions to the song of Clara in Goethe's "Egmont."--TR.

13.

The Theory of the Sense of Power.--We exercise our power over others by doing them good or by doing them ill--that is all we care for! _Doing ill_ to those on whom we have to make our power felt; for pain is a far more sensitive means for that purpose than pleasure:--pain always asks concerning the cause, while pleasure is inclined to keep within itself and not look backward. _Doing

good_ and being kind to those who are in any way already dependent on us (that is, who are accustomed to think of us as their _raison d'être);_ we want to increase their power, because we thus increase our own; or we want to show them the advantage there is in being in our power,--they thus become more contented with their position, and more hostile to the enemies of _our_ power and readier to contend with to If we make sacrifices in doing good or in doing ill, it does not alter the ultimate value of our actions; even if we stake our life in the cause, as martyrs for the sake of our church, it is a sacrifice to _our_ longing for power, or for the purpose of conserving our sense of power. He who under these circumstances feels that he "is in possession of truth" how many possessions does he not let go, in order to preserve this feeling! What does he not throw overboard, in order to keep himself "up,"--that is to say, _above_ the others who lack the truth. Certainly the condition we are in when we do ill is seldom so pleasant, so purely pleasant as that in which we practise kindness,--it is an indication that we still lack power, or it betrays ill-humour at this defect in us; it brings with it new dangers and uncertainties as to the power we already possess, and clouds our horizon by the prospect of revenge, scorn, punishment and failure. Perhaps only tee most susceptible to the sense of power and eager for it, will prefer to impress the seal of power on the resisting individual.--those to whom the sight of the already subjugated person as the object of benevolence is a burden and a tedium. It is a question how a person is accustomed to _season_ his life; it is a matter of taste whether a person would rather have the slow or the sudden to safe or the dangerous and daring increase of power,--he seeks this or that seasoning always according to his temperament. An easy booty is something contemptible to proud natures; they have an agreeable sensation only at the sight of men of unbroken spirit who could be enemies to them, and similarly, also, at the sight of all not easily accessible possession; they are often hard toward the sufferer, for he is not worthy of their effort or their pride,--but they show themselves so much the more courteous towards their _equals,_ with whom strife and struggle would in any case be full of honour, _if_ at any time an occasion for it should present itself. It is under the agreeable feelings of _this_ perspective that the members of the knightly caste have habituated themselves to exquisite courtesy toward one another.--Pity is the most pleasant feeling in those who have not much pride, and have no prospect of great conquests: the easy booty--and that is what every sufferer is--is for them an enchanting thing. Pity is said to be the virtue of the gay lady.

14.

What is called Love.--The lust of property, and love: what different associations each of these ideas evoke!--and yet it might be the same impulse twice named: on the one occasion disparaged from the standpoint of those already possessing (in whom the impulse has attained something of repose,--who are now apprehensive for the safety of their "possession"); on the other occasion viewed from the standpoint of the unsatisfied and thirsty, and therefore glorified as "good." Our love of our neighbour,--is it not a striving after new _property?_ And similarly our love of knowledge, of truth; and in general all the striving after novelties? We gradually become satiated with the old and securely possessed, and again stretch out our hands; even the finest landscape in which we live for three months is no longer certain of our love, and any kind of more distant coast excites our covetousness: the possession for the most part becomes smaller through possessing. Our pleasure in ourselves seeks to maintain itself by always transforming something new _into ourselves,_--that is just possessing. To become satiated with a possession, that is to become satiated with ourselves. (One can also suffer from excess,--even the desire to cast away, to share out, may assume the honourable name of "love.") When we see any one suffering, we willingly utilise the opportunity then afforded to take possession of him; the beneficent and sympathetic man, for example, does this; he also calls the desire for new possession awakened in him, by the name of "love," and has enjoyment in it, as in a new acquisition suggesting itself to him. The love of the sexes, however, betrays itself most plainly as the striving after possession: the lover wants the unconditioned, sole possession of the person longed for by him; he wants just as absolute power over her soul as over her body; he wants to be loved solely, and to dwell and rule in the other soul as what is highest and most to be desired. When one considers that this means precisely to _exclude_ all the world from a precious possession, a happiness, and an enjoyment; when one considers that the lover has in view the impoverishment and privation of all other rivals, and would like to become the dragon of his golden hoard, as the most inconsiderate and selfish of all "conquerors" and exploiters; when one considers finally that to the lover himself, the whole world besides appears indifferent, colourless, and worthless, and that he is ready to make every sacrifice, disturb every arrangement, and put every other interest behind his own,--one is verily surprised that this ferocious lust of property and injustice of sexual love should have been glorified and deified to such an extent at all times; yea, that out of this love the conception of love as the antithesis of egoism should have been derived, when it is perhaps precisely the most unqualified expression of egoism. Here, evidently, the non-possessors and desirers have determined the usage of language,--there were, of course, always too many of them. Those who have been favoured with much possession and satiety, have, to be sure, dropped a word now and then about the "raging demon," as, for instance, the most lovable and most beloved of all the Athenians--Sophocles; but Eros always laughed at such revilers,--they were always his greatest favourites.--There is, of course, here and there on this terrestrial sphere a kind of sequel to love, in which that covetous longing of

two persons for one another has yielded to a new desire and covetousness, to a _common,_ higher thirst for a superior ideal standing above them: but who knows this love? Who has experienced it? Its right name is _friendship._

15.

Out of the Distance.--This mountain makes the whole district which it dominates charming in every way, and full of significance. After we have said this to ourselves for the hundredth time, we are so irrationally and so gratefully disposed towards it, as the giver of this charm, that we fancy it must itself be the most charming thing in the district--and so we climb it, and are undeceived. All of a sudden, both it and the landscape around us and under us, are as it were disenchanted; we had forgotten that many a greatness, like many a goodness, wants only to be seen at a certain distance, and entirely from below, not from above,--it is thus only that _it operates._ Perhaps you know men in your neighbourhood who can only look at themselves from a certain distance to find themselves at all endurable, or attractive and enlivening; they are to be dissuaded from self-knowledge.

16.

_Across the Plank.--_One must be able to dissimulate in intercourse with persons who are ashamed of their feelings; they take a sudden aversion to anyone who surprises them in a state of tenderness, or of enthusiastic and high-running feeling, as if he had seen their secrets. If one wants to be kind to them in such moments one should make them laugh, or say some kind of cold, playful wickedness:--their feeling thereby congeals, and they are again self-possessed. But I give the moral before the story.--We were once on a time so near one another in the course of our lives, that nothing more seemed to hinder our friendship and fraternity, and there was merely a small plank between us. While you were just about to step on it, I asked you: "Do you want to come across the plank to me?" But then you did not want to come any longer; and when I again entreated, you were silent. Since then mountains and torrents, and whatever separates and alienates, have interposed between us, and even if we wanted to come to one another, we could no longer do so! When, however, you now remember that small plank, you have no longer words,--but merely sobs and amazement.

17.

Motivation of Poverty.--We cannot, to be sure, by any artifice make a rich and richly-flowing virtue out of a poor one, but we can gracefully enough reinterpret its poverty into necessity, so that its aspect no longer gives pain to us, and we cease making reproachful faces at fate on account of it. It is thus that the wise gardener does who puts the tiny streamlet of his garden into the arms of a fountain-nymph, and thus motivates the poverty:--and who would not like him need the nymphs!

18.

Ancient Pride.--The ancient savour of nobility is lacking in us, because the ancient slave is lacking in our sentiment. A Greek of noble descent found such immense intermediate stages, and such a distance betwixt his elevation and that ultimate baseness, that he could hardly even see the slave plainly: even Plato no longer saw him entirely. It is otherwise with us, accustomed as we are to the _doctrine_ of the equality of men, although not to the equality itself. A being who has not the free disposal of himself and has not got leisure,--that is not regarded by us as anything contemptible; there is perhaps too much of this kind of slavishness in each of us, in accordance with the conditions of our social order and activity, which are fundamentally different from those of the ancients.--The Greek philosopher went through life with the secret feeling that there were many more slaves than people supposed--that is to say, that every one was a slave who was not a philosopher. His pride was puffed up when he considered that even the mightiest of the earth were thus to be looked upon as slaves. This pride is also unfamiliar to us, and impossible; the word "slave" has not its full force for us even in simile.

19.

Evil.--Test the life of the best and most productive men and nations, and ask yourselves whether a tree which is to grow proudly heavenward can dispense with bad weather and tempests: whether disfavour and opposition from without, whether every kind of hatred, jealousy, stubbornness, distrust, severity, greed, and violence do not belong to the _favouring_ circumstances without which a great growth even in virtue is hardly possible? The poison by which the weaker nature is destroyed is strengthening to the strong individual--and he does not call it poison.

20.

Dignity of Folly.--Several millenniums further on in the path of the last century!--and in everything that man does the highest prudence will be exhibited: but just thereby prudence will have lost all its dignity. It will then, sure enough, be necessary to be prudent, but it will also be so usual and common, that a more fastidious taste will feel this necessity as _vulgarity._ And just as a tyranny of truth and science would be in a position to raise the value of falsehood, a tyranny of prudence could force into prominence a new species of nobleness. To be noble--that might then mean, perhaps, to be capable of follies.

21.

To the Teachers of Unselfishness.--The virtues of a man are called _good,_ not in respect to the results they have for himself, but in respect to the results which we expect therefrom for ourselves and for society:--we have all along had very little unselfishness, very little "non-egoism" in our praise of the virtues! For otherwise it could not but have been seen that the virtues (such as diligence, obedience, chastity, piety, justice) are mostly _injurious_ to their possessors, as impulses which rule in them too vehemently and ardently, and do not want to be kept in co-ordination with the other impulses by the reason. If you have a virtue, an actual, perfect virtue (and not merely a kind of impulse towards virtue!)--you are its _victim!_ But your neighbour praises your virtue precisely on that account! One praises the diligent man though he injures his sight, or the originality and freshness of his spirit, by his diligence; the youth is honoured and regretted who has "worn himself out by work," because one passes the judgment that "for society as a whole the loss of the best individual is only a small sacrifice! A pity that this sacrifice should be necessary! A much greater pity it is true, if the individual should think differently and regard his preservation and development as more important than his work in the service of society!" And so one regrets this youth, not on his own account, but because a devoted _instrument,_ regardless of self--a so-called "good man," has been lost to society by his death. Perhaps one further considers the question, whether it would not have been more advantageous for the interests of society if he had laboured with less disregard of himself, and had preserved himself longer-indeed one readily admits an advantage therefrom but one esteems the other advantage, namely, that a _sacrifice_ has been made, and that the disposition of the sacrificial animal has once more been _obviously_ endorsed--as higher and more enduring. It is accordingly, on the one part, the instrumental character in the virtues which is praised when the virtues are praised, and on the other part the blind, ruling impulse in every virtue which refuse to let itself be kept within bounds by the general advantage to the individual; in short, what is praised is the unreason in the virtues, in consequence of which the individual allows himself to be transformed into a function of the whole. The praise of the virtues is the praise of something which is privately injurious to the individual; it is praise of impulses which deprive man of his noblest self-love, and the power to take the best care of himself. To be sure, for the teaching and embodying of virtuous habits a series of effects of virtue are displayed, which make it appear that virtue and private advantage are closely related,--and there is in fact such a relationship! Blindly furious diligence, for example, the typical virtue of an instrument, is represented as the way to riches and honour, and as the most beneficial antidote to tedium and passion: but people are silent concerning its danger, its greatest dangerousness. Education proceeds in this manner throughout: it endeavours, by a series of enticements and advantages, to determine the individual to a certain mode of thinking and acting, which, when it has become habit, impulse and passion, rules in him and over him, _in opposition to his ultimate advantage,_ but "for the general good." How often do I see that blindly furious diligence does indeed create riches and honours, but at the same time deprives the organs of the refinement by virtue of which alone an enjoyment of riches and honours is possible; so that really the main expedient for combating tedium and passion, simultaneously blunts the senses and makes the spirit refractory towards new stimuli! (The busiest of all ages--our age--does not know how to make anything out of its great diligence and wealth, except always more and more wealth, and more and more diligence; there is even more genius needed for laying out wealth than for acquiring it!--Well, we shall have our "grandchildren"!) If the education succeeds, every virtue of the individual is a public utility, and a private disadvantage in respect to the highest private end,--probably some psycho-æsthetic stunting, or even premature dissolution. One should consider successively from the same standpoint the virtues of obedience, chastity, piety, and justice. The praise of the unselfish, self-sacrificing, virtuous person--he, consequently, who does not expend his whole energy and reason for _his own_ conservation, development, elevation, furtherance and augmentation of power, but lives as regards himself unassumingly and thoughtlessly, perhaps even indifferently or ironically--this praise has in any case not originated out of the spirit of unselfishness! The "neighbour" praises unselfishness because _he profits by it!_ If the neighbour were "unselfishly" disposed himself, he would reject that destruction of power, that injury for _his_ advantage, he would thwart such inclinations in their origin, and above all he would manifest his unselfishness just by _not giving it a good name!_ The fundamental contradiction in that morality which at present stands in high honour is here indicated: the _motives_ to such a morality are in antithesis to its _principle!_ That with which this morality wishes to prove itself, refutes it out of its criterion of what is moral! The maxim, "Thou shalt renounce thyself and offer thyself as a sacrifice," in order not to be inconsistent with its own morality, could only be decreed by a being who himself renounced his own advantage thereby, and who perhaps in the required self-sacrifice of

individuals brought about his own dissolution. As soon; however, as the neighbour (or society) recommended altruism _on account of its utility,_ the precisely antithetical proposition, "Thou shalt seek thy advantage even at the expense of everybody else," was brought into use: accordingly, "thou shalt," and "thou shalt not," are preached in one breath!

22.

_L'Ordre du jour pour le Roi.--_The day commences: let us begin to arrange for this day the business and fêtes of our most gracious lord, who at present is still pleased to repose. His Majesty has bad weather to-day: we shall be careful not to call it bad; we shall not speak of the weather,--but we shall go through to-day's business somewhat more ceremoniously and make the fêtes somewhat more festive than would otherwise be necessary. His Majesty may perhaps even be sick: we shall give the last good news of the evening at breakfast, the arrival of M. Montaigne, who knows how to joke so pleasantly about his sickness,--he suffers from stone. We shall receive several persons (persons!--what would that old inflated frog, who will be among them, say, if he heard this word! "I am no person," he would say, "but always the thing itself")--and the reception will last longer than is pleasant to anybody; a sufficient reason for telling about the poet who wrote over his door, "He who enters here will do me an honour; he who does not--a favour."--That is, forsooth, saying a discourteous thing in a courteous manner! And perhaps this poet is quite justified on his part in being discourteous; they say that his rhymes are better than the rhymester. Well, let him still make many of them, and withdraw himself as much as possible from the world: and that is doubtless the significance of his well-bred rudeness! A prince, on the other hand, is always of more value than his "verse," even when--but what are we about? We gossip,' and the whole court believes that we have already been at work and racked our brains: there is no light to be seen earlier than that which burns in our window.--Hark! Was that not the bell? The devil! The day and the dance commence, and we do not know our rounds! We must then improvise,--all the world improvises its day. To-day, let us for once do like all the world!--And therewith vanished my wonderful morning dream, probably owing to the violent strokes of the tower-clock, which just then announced the fifth hour with all the importance which is peculiar to it. It seems to me that on this occasion the God of dreams wanted to make merry over my habits,--it is my habit to commence the day by arranging it properly, to make it endurable _for myself_ and it is possible that I may often have done this too formally, and too much like a prince.

23.

The Characteristics of Corruption.--Let us observe the following characteristics in that condition of society from time to time necessary, which is designated by the word "corruption." Immediately upon the appearance of corruption anywhere, a motley _superstition_ gets the upper hand, and the hitherto universal belief of a people becomes colourless and impotent in comparison with it; for superstition is free-thinking of the second rank,--he who gives himself over to it selects certain forms and formulæ which appeal, to him, and permits himself a right of choice. The superstitious man is always much more of a "person," in comparison with the religious man, and a superstitious society will be one in which there are many individuals, and a delight in individuality. Seen from this standpoint superstition always appears as a _progress_ in comparison with belief, and as a sign that the intellect becomes more independent and claims to have its rights. Those who reverence the old religion and the religious disposition then complain of corruption,--they have hitherto also determined the usage of language, and have given a bad repute to superstition, even among the freest spirits. Let us learn that it is a symptom of _enlightenment._--Secondly, a society in which corruption takes a hold is blamed for _effeminacy:_ for the appreciation of war, and the delight in war, perceptibly diminish in such a society, and the conveniences of life are now just as eagerly sought after as were military and gymnastic honours formerly. But one is accustomed to overlook the fact that the old national energy and national passion, which acquired a magnificent splendour in war and in the tourney, has now transferred itself into innumerable private passions, and has merely become less visible; indeed in periods of "corruption" the quantity and quality of the expended energy of a people is probably greater than ever, and the individual spends it lavishly, to such an extent as could not be done formerly--he was not then rich enough to do so! And thus it is precisely in times of "effeminacy" that tragedy runs at large in and out of doors, it is then that ardent love and ardent hatred are born, and the flame of knowledge flashes heavenward in full blaze.--Thirdly, as if in amends for the reproach of superstition and effeminacy, it is customary to say of such periods of corruption that they are milder, and that cruelty has then greatly diminished in comparison with the older, more credulous, and stronger period. But to this praise I am just as little able to assent as to that reproach: I only grant so much--namely, that cruelty now becomes more refined, and its older forms are henceforth counter to the taste; but the wounding and torturing by word and look reaches its highest development in times of corruption,--it is now only that _wickedness_ is created, and the delight in wickedness. The men of the period of corruption are witty and calumnious; they know that there are yet other ways of murdering than by the dagger and the ambush--they know also that all that is _well said_ is believed in.--Fourthly, it is when "morals decay" that those beings whom one calls tyrants first make their appearance; they are the forerunners of the

individual, and as it were early matured _firstlings._ Yet a little while, and this fruit of fruits hangs ripe and yellow on the tree of a people,--and only for the sake of such fruit did this tree exist! When the decay has reached its worst, and likewise the conflict of all sorts of tyrants, there always arises the Cæsar, the final tyrant, who puts an end to the exhausted struggle for sovereignty, by making the exhaustedness work for him. In his time the individual is usually most mature, and consequently the "culture" is highest and most fruitful, but not on his account nor through him: although the men of highest culture love to flatter their Cæsar by pretending that they are _his_ creation. The truth, however, is that they need quietness externally, because they have disquietude and labour internally. In these times bribery and treason are at their height: for the love of the _ego,_ then first discovered, is much more powerful than the love of the old, used-up, hackneyed "father-land"; and the need to be secure in one way or other against the frightful fluctuations of fortune, opens even the nobler hands, as soon as a richer and more powerful person shows himself ready to put gold into them. There is then so little certainty with regard to the future; people live only for the day: a psychical condition which enables every deceiver to play an easy game,--people of course only let themselves be misled and bribed "for the present," and reserve for themselves futurity and virtue. The individuals, as is well known, the men who only live for themselves, provide for the moment more than do their opposites, the gregarious men, because they consider themselves just as incalculable as the future; and similarly they attach themselves willingly--to despots, because they believe themselves capable of activities and expedients, which can neither reckon on being understood by the multitude, nor on finding favour with them--but the tyrant or the Cæsar understands the rights of the individual even in his excesses, and has an interest in speaking on behalf of a bolder private morality, and even in giving his hand to it For he thinks of himself, and wishes people to think of him what Napoleon once uttered in his classical style--"I have the right to answer by an eternal 'thus I am' to everything about which complaint is brought against me. I am apart from all the world, I accept conditions from nobody. I wish people also to submit to my fancies, and to take it quite as a simple matter, if I should indulge in this or that diversion." Thus spoke Napoleon once to his wife, when she had reasons for calling in question the fidelity of her husband. The times of corruption are the seasons when the apples fall from the tree: I mean the individuals, the seed-bearers of the future, the pioneers of spiritual colonisation, and of a new construction of national and social unions. Corruption is only an abusive term for the _harvest time_ of a people.

24.

_Different Dissatisfactions.--_The feeble and as it were feminine dissatisfied people, have ingenuity for beautifying and deepening life; the strong dissatisfied people--the masculine persons among them to continue the metaphor--have ingenuity for improving and safeguarding life. The former show their weakness and feminine character by willingly letting themselves be temporarily deceived, and perhaps even by putting up with a little ecstasy and enthusiasm on a time, but on the whole they are never to be satisfied, and suffer from the incurability of their dissatisfaction; moreover they are the patrons of all those who manage to concoct opiate and narcotic comforts, and on that account are averse to those who value the physician higher than the priest,--they thereby encourage the _continuance_ of actual distress! If there had not been a surplus of dissatisfied persons of this kind in Europe since the time of the Middle Ages, the remarkable capacity of Europeans for constant _transformation_ would perhaps not have originated at all; for the claims of the strong dissatisfied persons are too gross, and really too modest to resist being finally quieted down. China is an instance of a country in which dissatisfaction on a grand scale and the capacity for transformation have died out for many centuries; and the Socialists and state-idolaters of Europe could easily bring things to Chinese conditions and to a Chinese "happiness," with their measures for the amelioration and security of life, provided that they could first of all root out the sicklier, tenderer, more feminine dissatisfaction and Romanticism which are still very abundant among us. Europe is an invalid who owes her best thanks to her incurability and the eternal transformations of her sufferings; these constant new situations, these equally constant new dangers, pains, and make-shifts, have at last generated an intellectual sensitiveness which is almost equal to genius, and is in any case the mother of all genius.

25.

Not Pre-ordained to Knowledge.--There is a pur-blind humility not at all rare, and when a person is afflicted with it, he is once for all disqualified for being a disciple of knowledge. It is this in fact: the moment a man of this kind perceives anything striking, he turns as it were on his heel and says to himself: "You have deceived yourself! Where have your wits been! This cannot be the truth!"--and then, instead of looking at it and listening to it with more attention, he runs out of the way of the striking object as if intimidated, and seeks to get it out of his head as quickly as possible. For his fundamental rule runs thus: "I want to see nothing that contradicts the usual opinion concerning things! Am _I_ created for the purpose of discovering new truths? There are already too many of the old ones."

26.

What is Living?--Living--that is to continually eliminate from ourselves what is about to die; Living--that is to be cruel and inexorable towards all that becomes weak and old in ourselves and not only in ourselves. Living--that means, there fore to be without piety toward the dying, the wrenched and the old? To be continually a murderer?--And yet old Moses said: "Thou shalt not kill!"

27.

The Self-Renouncer.--What does the self-renouncer do? He strives after a higher world, he wants to fly longer and further and higher than all men of affirmation--he _throws away many things_ that would impede his flight, and several things among them that are not valueless, that are not unpleasant to him: he sacrifices them to his desire for elevation. Now this sacrificing, this casting away, is the very thing which becomes visible in him: on that account one calls him a self-renouncer, and as such he stands before us, enveloped in his cowl, and as the soul of a hair-shirt. With this effect, however, which he makes upon us he is well content: he wants to keep concealed from us his desire, his pride, his intention of flying _above_ us.--Yes! He is wiser than we thought, and so courteous towards us--this affirmer! For that is what he is, like us, even in his self-renunciation.

28.

Injuring with ones best Qualities.--Out strong points sometimes drive us so far forward that we cannot any longer endure our weaknesses, and we perish by them: we also perhaps see this result beforehand, but nevertheless do not want it to be otherwise. We then become hard towards that which would fain be spared in us, and our pitilessness is also our greatness. Such an experience, which must in the end cost us our Hie, is a symbol of the collective effect of great men upon others and upon their epoch:--it is just with their best abilities, with that which only _they_ can do, that they destroy much that is weak, uncertain, evolving, and _willing,_ and are thereby injurious. Indeed, the case may happen in which, taken on the whole, they only do injury, because their best is accepted and drunk up as it were solely by those who lose their understanding and their egoism by it, as by too strong a beverage; they become so intoxicated that they go breaking their limbs on all the wrong roads where their drunkenness drives them.

29.

Adventitious Liars.--When people began to combat the unity of Aristotle in France, and consequently also to defend it, there was once more to be seen that which has been seen so often, but seen so unwillingly:--_people imposed false reasons on themselves_ on account of which those laws ought to exist, merely for the sake of not acknowledging to themselves that they had _accustomed_ themselves to the authority of those laws, and did not want any longer to have things otherwise. And people do so in every prevailing morality and religion, and have always done so: the reasons and intentions behind the habit, are only added surreptitiously when people begin to combat the habit, and _ask_ for reasons and intentions. It is here that the great dishonesty of the conservatives of all times hides:--they are adventitious liars.

30.

_The Comedy of Celebrated Men.--_Celebrated men who _need_ their fame, as, for instance, all politicians, no longer select their associates and friends without fore-thought: from the one they want a portion of the splendour and reflection of his virtues; from the other they want the fear-inspiring power of certain dubious qualities in him, of which everybody is aware; from another they steal his reputation for idleness and basking in the sun, because it is advantageous for their own ends to be regarded temporarily as heedless and lazy:--it conceals the fact that they lie in ambush; they now use the visionaries, now the experts, now the brooders, now the pedants in their neighbourhood, as their actual selves for the time; but very soon they do not need them any longer! And thus while their environment and outside die off continually, everything seems to crowd into this environment, and wants to become a "character" of it; they are like great cities in this respect. Their repute is continually in process of mutation, like their character, for their changing methods require this change, and they show and _exhibit_ sometimes this and sometimes that actual or fictitious quality on the stage; their friends and associates, as we have said, belong to these stage properties. On the other hand, that which they aim at must remain so much the more steadfast, and burnished and resplendent in the distance,--and this also sometimes needs its comedy and its stage-play.

31.

Commerce and Nobility.--Buying and selling is now regarded as something ordinary, like the art of reading and writing; everyone is now trained to it even when he is not a tradesman exercising himself daily in the art; precisely as formerly in the period of uncivilised humanity, everyone was a hunter and exercised himself day by day in the art of hunting. Hunting was then something common: but just as this finally became a privilege of the powerful and noble, and thereby lost the character of the commonplace and the ordinary--by ceasing to be necessary and by becoming an affair of fancy and luxury,--so it might become the same some day with buying and selling. Conditions of society are imaginable in which there will be no selling and buying, and in which the necessity for this art will become quite lost; perhaps it may then happen that individuals who are less subjected to the law of the prevailing condition of things will indulge in buying and selling as a _luxury of sentiment. _ It is then only that commerce would acquire nobility, and the noble would then perhaps occupy themselves just as readily with commerce as they have done hitherto with war and politics: while on the other hand the valuation of politics might then have entirely altered. Already even politics ceases to be the business of a gentleman; and it is possible that one day it may be found to be so vulgar as to be brought, like all party literature and daily literature, under the rubric: "Prostitution of the intellect."

32.

Undesirable Disciples.--What shall I do with these two youths! called out a philosopher dejectedly, who "corrupted" youths, as Socrates had once corrupted them,--they are unwelcome disciples to me. One of them cannot say "Nay," and the other says "Half and half" to everything. Provided they grasped my doctrine, the former would _suffer_ too much, for my mode of thinking requires a martial soul, willingness to cause pain, delight in denying, and a hard skin,--he would succumb by open wounds and internal injuries. And the other will choose the mediocre in everything he represents, and thus make a mediocrity of the whole,--I should like my enemy to have such a disciple.

33.

Outside the Lecture-room.--"In order to prove that man after all belongs to the good-natured animals, I would remind you how credulous he has been for so long a time. It is now only, quite late, and after an immense self-conquest, that he has become a _distrustful_ animal,--yes! man is now more wicked than ever."--I do not understand this; why should man now be more distrustful and more wicked?--"Because now he has science,--because he needs to have it!"--

34.

Historia abscondita.--Every great man has a power which operates backward; all history is again placed on the scales on his account, and a thousand secrets of the past crawl out of their lurking-places--into _his_ sunlight. There is absolutely no knowing what history may be some day. The past is still perhaps undiscovered in its essence! There is yet so much reinterpreting ability needed!

35.

Heresy and Witchcraft.--To think otherwise than is customary--that is by no means so much the activity of a better intellect, as the activity of strong, wicked inclinations,--severing, isolating, refractory, mischief-loving, malicious inclinations. Heresy is the counterpart of witchcraft, and is certainly just as little a merely harmless affair, or a thing worthy of honour in itself. Heretics and sorcerers are two kinds of bad men; they have it in common that they also feel themselves wicked; their unconquerable delight is to attack and injure whatever rules,--whether it be men or opinions. The Reformation, a kind of duplication of the spirit of the Middle Ages at a time when it had no longer a good conscience, produced both of these kinds of people in the greatest profusion.

36.

Last Words.-It will be recollected that the Emperor Augustus, that terrible man, who had himself as much in his own power and could be silent as well as any wise Socrates, became indiscreet about himself in his last words; for the first time he let his mask fall, when he gave to understand that he had carried a mask and played a comedy,--he had played the father of his country and wisdom on the throne well, even to the point of illusion! _Plaudite amid, comœdia finita est!--_The thought of the dying Nero: _qualis artifex pereo!_ was also the thought of the dying Augustus: histrionic conceit! histrionic loquacity! And the very counterpart to the dying Socrates!--But Tiberius died silently, that most tortured of all self-torturers,--_he_ was _genuine_ and not a stage-player! What may have passed through his head in the end! Perhaps this: "Life--that is a long death. I am a fool, who shortened the lives of so many!

Was _I_ created for the purpose of being a benefactor? I should have given them eternal life: and then I could have _seen them dying_ eternally. I had such good eyes _for that: qualis spectator pereo!_" When he seemed once more to regain his powers after a long death-struggle, it was considered advisable to smother him with pillows,--he died a double death.

37.

Owing to three Errors.--Science has been furthered during recent centuries, partly because it was hoped that God's goodness and wisdom would be best understood therewith and thereby--the principal motive in the soul of great Englishmen (like Newton); partly because the absolute utility of knowledge was believed in, and especially the most intimate connection of morality, knowledge, and happiness--the principal motive in the soul of great Frenchmen (like Voltaire); and partly because it was thought that in science there was something unselfish, harmless, self-sufficing, lovable, and truly innocent to be had, in which the evil human impulses did not at all participate--the principal motive in the soul of Spinoza, who felt himself divine, as a knowing being:--it is consequently owing to three errors that science has been furthered.

38.

Explosive People.--When one considers how ready are the forces of young men for discharge, one does not wonder at seeing them decide so uncritically and with so little selection for this or that cause: _that_ which attracts them is the sight of eagerness for a cause, as it were the sight of the burning match--not the cause itself. The more ingenious seducers on that account operate by holding out the prospect of an explosion to such persons, and do not urge their cause by means of reasons; these powder-barrels are not won over by means of reasons!

39.

Altered Taste.--The alteration of the general taste is more important than the alteration of opinions; opinions, with all their proving, refuting, and intellectual masquerade, are merely symptoms of altered taste, and are certainly _not_ what they are still so often claimed to be, the causes of the altered taste. How does the general taste alter? By the fact of individuals, the powerful and influential persons, expressing and tyrannically enforcing without any feeling of shame, _their hoc est ridiculum, hoc est absurdum;_ the decisions, therefore, of their taste and their disrelish:--they thereby lay a constraint upon many people, out of which there gradually grows a habituation for still more, and finally a _necessity for all._ The fact, however, that these individuals feel and "taste" differently, has usually its origin in a peculiarity of their mode of life, nourishment, or digestion, perhaps in a surplus or deficiency of the inorganic salts in their blood and brain, in short in their _physis;_ they have, however, the courage to avow their physical constitution, and to lend an ear even to the most delicate tones of its requirements: their æsthetic and moral judgments are those "most delicate tones" of their _physis._

40.

The Lack of a noble Presence.--Soldiers and their leaders have always a much higher mode of comportment toward one another than workmen and their employers. At present at least, all militarily established civilisation still stands high above all so-called industrial civilisation; the latter, in its present form, is in general the meanest mode of existence that has ever been. It is simply the law of necessity that operates here: people want to live, and have to sell themselves; but they despise him who exploits their necessity and _purchases_ the workman. It is curious that the subjection to powerful, fear-inspiring, and even dreadful individuals, to tyrants and leaders of armies, is not at all felt so painfully as the subjection to such undistinguished and uninteresting persons as the captains of industry; in the employer the workman usually sees merely a crafty, blood-sucking dog of a man, speculating on every necessity, whose name, form, character, and reputation are altogether indifferent to him. It is probable that the manufacturers and great magnates of commerce have hitherto lacked too much all those forms and attributes of a _superior race,_ which alone make persons interesting; if they had had the nobility of the nobly-born in their looks and bearing, there would perhaps have been no socialism in the masses of the people. For these are really ready for _slavery_ of every kind, provided that the superior class above them constantly shows itself legitimately superior, and _born_ to command--by its noble presence! The commonest man feels that nobility is not to be improvised, and that it is his part to honour it as the fruit of protracted race-culture,--but the absence of superior presence, and the notorious vulgarity of manufacturers with red, fat hands, brings up the thought to him that it is only chance and fortune that has here elevated the one above the other; well then--so he reasons with himself--let _us_ in our turn tempt chance and fortune! Let us in our turn throw the dice!--and socialism commences.

41.

_Against Remorse.--_The thinker sees in his own actions attempts and questionings to obtain information about something or other; success and failure are _answers_ to him first and foremost. To vex himself, however, because something does not succeed, or to feel remorse at all--he leaves that to those who act because they are commanded to do so, and expect to get a beating when their gracious master is not satisfied with the result.

42.

Work and Ennui--In respect to seeking work for the sake of the pay, almost all men are alike at present in civilised countries; to all of them work is a means, and not itself the end; on which account they are not very select in the choice of the work, provided it yields an abundant profit. But still there are rarer men who would rather perish than work without _delight_ in their labour: the fastidious people, difficult to satisfy, whose object is not served by an abundant profit, unless the work itself be the reward of all rewards. Artists and contemplative men of all kinds belong to this rare species of human beings; and also the idlers who spend their life in hunting and travelling, or in love-affairs and adventures. They all seek toil and trouble in so far as these are associated with pleasure, and they want the severest and hardest labour, if it be necessary. In other respects, however, they have a resolute indolence, even should impoverishment, dishonour, and danger to health and life be associated therewith. They are not so much afraid of ennui as of labour without pleasure; indeed they require much ennui, if _their_ work is to succeed with them. For the thinker and for all inventive spirits ennui is the unpleasant "calm" of the soul which precedes the happy voyage and the dancing breezes; he must endure it, he must _await_ the effect it has on him:--it is precisely _this_ which lesser natures cannot at all experience! It is common to scare away ennui in every way, just as it is common to labour without pleasure. It perhaps distinguishes the Asiatics above the Europeans, that they are capable of a longer and profounder repose; even their narcotics operate slowly and require patience, in contrast to the obnoxious suddenness of the European poison, alcohol.

43.

What the Laws Betray.--One makes a great mistake when one studies the penal laws of a people, as if they were an expression of its character; the laws do not betray what a people is, but what appears to them foreign, strange, monstrous, and outlandish. The laws concern themselves with the exceptions to the morality of custom; and the severest punishments fall on acts which conform to the customs of the neighbouring peoples. Thus among the Wahabites, there are only two mortal sins: having another God than the Wahabite God, and--smoking (it is designated by them as "the disgraceful kind of drinking"). "And how is it with regard to murder and adultery?"-asked the Englishman with astonishment on learning these things. "Well, God is gracious and pitiful!" answered the old chief.--Thus among the ancient Romans there was the idea that a woman could only sin mortally in two ways: by adultery on the one hand, and--by wine-drinking on the other. Old Cato pretended that kissing among relatives had only been made a custom in order to keep women in control on this point; a kiss meant: did her breath smell of wine? Wives had actually been punished by death who were surprised taking wine: and certainly not merely because women under the influence of wine sometimes unlearn altogether the art of saying No; the Romans were afraid above all things of the orgiastic and Dionysian spirit with which the women of Southern Europe at that time (when wine was still new in Europe) were sometimes visited, as by a monstrous foreignness which subverted the basis of Roman sentiments; it seemed to them treason against Rome, as the embodiment of foreignness.

44.

The Believed Motive.--However important it may be to know the motives according to which mankind has really acted hitherto, perhaps the _belief_ in this or that motive, and therefore that which mankind has assumed and imagined to be the actual mainspring of its activity hitherto, is something still more essential for the thinker to know. For the internal happiness and misery of men have always come to them through their belief in this or that motive,--_not_ however, through that which was actually the motive! All about the latter has an interest of secondary rank.

45.

Epicurus.--Yes, I am proud of perceiving the character of Epicurus differently from anyone else perhaps, and of enjoying the happiness of the afternoon of antiquity in all that I hear and read of him:--I see his eye gazing out on a broad whitish sea, over the shore-rocks on which the sunshine rests, while great and small creatures play in its light, secure and calm like this light and that eye itself. Such happiness could only have been devised by a chronic sufferer, the happiness of an eye before which the sea of

existence has become calm, and which can no longer tire of gazing at the surface and at the variegated, tender, tremulous skin of this sea. Never previously was there such a moderation of voluptuousness.

46.

_Our Astonishment--_There is a profound and fundamental satisfaction in the fact that science ascertains things that _hold their ground,_ and again furnish the basis for new researches:--it could certainly be otherwise. Indeed, we are so much convinced of all the uncertainty and caprice of our judgments, and of the everlasting change of all human laws and conceptions, that we are really astonished _how persistently_ the results of science hold their ground! In earlier times people knew nothing of this changeability of all human things; the custom of morality maintained the belief that the whole inner life of man was bound to iron necessity by eternal fetters:--perhaps people then felt a similar voluptuousness of astonishment when they listened to tales and fairy stories. The wonderful did so much good to those men, who might well get tired sometimes of the regular and the eternal. To leave the ground for once! To soar! To stray! To be mad!--that belonged to the paradise and the revelry of earlier times; while our felicity is like that of the shipwrecked man who has gone ashore, and places himself with both feet on the old, firm ground--in astonishment that it does not rock.

47.

The Suppression of the Passions.--When one continually prohibits the expression of the passions as something to be left to the "vulgar," to coarser, bourgeois, and peasant natures--that is, when one does not want to suppress the passions themselves, but only their language and demeanour, one nevertheless realises _therewith_ just what one does not want: the suppression of the passions themselves, or at least their weakening and alteration,--as the court of Louis XIV. (to cite the most instructive instance), and all that was dependent on it, experienced. The generation _that followed,_ trained in suppressing their expression, no longer possessed the passions themselves, but had a pleasant, superficial, playful disposition in their place,--a generation which was so permeated with the incapacity to be ill-mannered, that even an injury was not taken and retaliated, except with courteous words. Perhaps our own time furnishes the most remarkable counterpart to this period: I see everywhere (in life, in the theatre, and not least in all that is written) satisfaction at all the _coarser_ outbursts and gestures of passion; a certain convention of passionateness is now desired,--only not the passion itself! Nevertheless _it_ will thereby be at last reached, and our posterity will have a _genuine savagery,_ and not merely a formal savagery and unmannerliness.

48.

_Knowledge of Distress.--_Perhaps there is nothing by which men and periods are so much separated from one another, as by the different degrees of knowledge of distress which they possess; distress of the soul as well as of the body. With respect to the latter, owing to lack of sufficient self-experience, we men of the present day (in spite of our deficiencies and infirmities), are perhaps all of us blunderers and visionaries in comparison with the men of the age of fear--the longest of all ages,--when the individual had to protect himself against violence, and for that purpose had to be a man of violence himself. At that time a man went through a long schooling of corporeal tortures and privations, and found even in a certain kind of cruelty toward himself, in a voluntary use of pain, a necessary means for his preservation; at that time a person trained his environment to the endurance of pain; at that time a person willingly inflicted pain, and saw the most frightful things of this kind happen to others without having any other feeling than for his own security. As regards the distress of the soul however, I now look at every man with respect to whether he knows it by experience or by description; whether he still regards it as necessary to simulate this knowledge, perhaps as an indication of more refined culture; or whether, at the bottom of his heart, he does not at all believe in great sorrows of soul, and at the naming of them calls to mind a similar experience as at the naming of great corporeal sufferings, such as tooth-aches, and stomach-aches. It is thus, however, that it seems to be with most people at present. Owing to the universal inexperience of both kinds of pain, and the comparative rarity of the spectacle of a sufferer, an important consequence results: people now hate pain far more than earlier man did, and calumniate it worse than ever; indeed people nowadays can hardly endure the _thought_ of pain, and make out of it an affair of conscience and a reproach to collective existence. The appearance of pessimistic philosophies is not at all the sign of great and dreadful miseries; for these interrogative marks regarding the worth of life appear in periods when the refinement and alleviation of existence already deem the unavoidable gnat-stings of the soul and body as altogether too bloody and wicked; and in the poverty of actual experiences of pain, would now like to make _painful general ideas_ appear as suffering of the worst kind.--There might indeed be a remedy for pessimistic philosophies and the excessive sensibility which seems to me the real "distress of the present":--but perhaps this remedy already sounds too cruel, and would itself be reckoned among the symptoms

owing to which people at present conclude that "existence is something evil." Well! the remedy for "the distress" is _distress._

49.

_Magnanimity and allied Qualities.--_Those paradoxical phenomena, such as the sudden coldness in the demeanour of good-natured men, the humour of the melancholy, and above all _magnanimity,_ as a sudden renunciation of revenge or of the gratification of envy--appear in men in whom there is a powerful inner impulsiveness, in men of sudden satiety and sudden disgust. Their satisfactions are so rapid and violent that satiety, aversion and flight into the antithetical taste, immediately follow upon them: in this contrast the convulsion of feeling liberates itself, in one person by sudden coldness, in another by laughter, and in a third by tear and self-sacrifice. The magnanimous person appears to me--at least that kind of magnanimous person who has always made most impression--as a man with the strongest thirst for vengeance, to whom a gratification presents itself close at hand, and who _already_ drinks it off _in imagination_ so copiously, thoroughly, and to the last drop, that an excessive, rapid disgust follows this rapid licentiousness;--he now elevates himself "above himself," as one says, and forgives his enemy, yea, blesses and honours him. With this violence done to himself, however, with this mockery of his impulse to revenge, even still so powerful he merely yields to the new impulse, the disgust which has become powerful, and does this just as impatiently and licentiously, as a short time previously he _forestalled,_ and as it were exhausted, the joy of revenge with his fantasy. In magnanimity there is the same amount of egoism as in revenge, but a different quality of egoism.

50.

The Argument of Isolation.--The reproach of conscience, even in the most conscientious, is weak against the feeling: "This and that are contrary to the good morals of _your_ society." A cold glance or a wry mouth on the part of those among whom and for whom one has been educated, is still _feared_ even by the strongest. What is really feared there? Isolation! as the argument which demolishes even the best arguments for a person or cause!--It is thus that the gregarious instinct speaks in us.

51.

_Sense for Truth.--_Commend me to all scepticism where I am permitted to answer: "Let us put it to the test!" But I don't wish to hear anything more of things and questions which do not admit of being tested. That is the limit of my "sense for truth": for bravery has there lost its right.

52.

_What others Know of us.--_That which we know of ourselves and have in our memory is not so decisive for the happiness of our life as is generally believed. One day it flashes upon our mind what _others_ know of us (or think they know)--and then we acknowledge that it is the more powerful. We get on with our bad conscience more easily than with our bad reputation.

53.

_Where Goodness Begins.--_Where bad eyesight can no longer see the evil impulse as such, on account of its refinement,--there man sets up the kingdom of goodness; and the feeling of having now gone over into the kingdom of goodness brings all those impulses (such as the feelings of security, of comfortableness, of benevolence) into simultaneous activity, which were threatened and confined by the evil impulses. Consequently, the duller the eye so much the further does goodness extend! Hence the eternal cheerfulness of the populace and of children! Hence the gloominess and grief (allied to the bad conscience) of great thinkers.

54.

_The Consciousness of Appearance.--_How wonderfully and novelly, and at the same time how awfully and ironically, do I feel myself situated with respect to collective existence, with my knowledge! I have _discovered_ for myself that the old humanity and animality, yea, the collective primeval age, and the past of all sentient being, continues to meditate, love, hate, and reason in me,--I have suddenly awoke in the midst of this dream, but merely to the consciousness that I just dream, and that I _must_ dream on in order not to perish; just as the sleep-walker must dream on in order not to tumble down. What is it that is now "appearance" to me! Verily, not the antithesis of any kind of essence,--what knowledge can I assert of any kind of essence whatsoever, except merely the predicates of its appearance! Verily not a dead mask which one could put upon an unknown X, and which to be sure one could also remove! Appearance is for me the operating and living thing itself; which goes so far in its self-mockery as to make me feel that

here there is appearance, and Will o' the Wisp, and spirit-dance, and nothing more,--that among all these dreamers, I also, the "thinker," dance my dance, that the thinker is a means of prolonging further the terrestrial dance, and in so far is one of the masters of ceremony of existence, and that the sublime consistency and connectedness of all branches of knowledge is perhaps, and will perhaps, be the best means for _maintaining_ the universality of the dreaming, the complete, mutual understandability of all those dreamers, and thereby _the duration of the dream_.

55.

The Ultimate Nobility of Character.--What then makes a person "noble"? Certainly not that he makes sacrifices; even the frantic libertine makes sacrifices. Certainly not that he generally follows his passions; there are contemptible passions. Certainly not that he does something for others, and without selfishness; perhaps the effect of selfishness is precisely at its greatest in the noblest persons.--But that the passion which seizes the noble man is a peculiarity, without his knowing that it is so: the use of a rare and singular measuring-rod, almost a frenzy: the feeling of heat in things which feel cold to all other persons: a divining of values for which scales have not yet been invented: a sacrificing on altars which are consecrated to an unknown God: a bravery without the desire for honour: a self-sufficiency which has superabundance, and imparts to men and things. Hitherto, therefore, it has been the rare in man, and the unconsciousness of this rareness, that has made men noble. Here, however, let us consider that everything ordinary, immediate, and indispensable, in short, what has been most preservative of the species, and generally the _rule_ in mankind hitherto, has been judged unreasonable and calumniated in its entirety by this standard, in favour of the exceptions. To become the advocate of the rule--that may perhaps be: the ultimate form and refinement in which nobility of character will reveal itself on earth.

56.

The Desire for Suffering.--When I think of the desire to do something, how it continually tickles and stimulates millions of young Europeans, who cannot endure themselves and all their ennui,--I conceive that there must be a desire in them to suffer something, in order to derive from their suffering a worthy motive for acting, for doing something. Distress is necessary! Hence the cry of the politicians, hence the many false trumped-up, exaggerated "states of distress" of all possible kinds, and the blind readiness to believe in them. This young world desires that there should arrive or appear _from the outside--not_ happiness--but misfortune; and their imagination is already busy beforehand to form a monster out of it, so that they may afterwards be able to fight with a monster. If these distress-seekers felt the power to benefit themselves, to do something for themselves from internal sources, they would also understand how to create a distress of their own, specially their own, from internal sources. Their inventions might then be more refined, and their gratifications might sound like good music: while at present they fill the world with their cries of distress, and consequently too often with the _feeling of distress_ in the first place! They do not know what to make of themselves--and so they paint the misfortune of others on the wall; they always need others! And always again other others!--Pardon me, my friends, I have ventured to paint my _happiness_ on the wall.

BOOK SECOND

57.

To the Realists.--Ye sober beings, who feel yourselves armed against passion and fantasy, and would gladly make a pride and an ornament out of your emptiness, ye call yourselves realists, and give to understand that the world is actually constituted as it appears to you; before you alone reality stands unveiled, and ye yourselves would perhaps be the best part of it,--oh, ye dear images of Sais! But are not ye also in your unveiled condition still extremely passionate and dusky beings compared with the fish, and still all too like an enamoured artist?[1]--and what is "reality" to an enamoured artist! Ye still carry about with you the valuations of things which had their origin in the passions and infatuations of earlier centuries! There is still a secret and ineffaceable drunkenness embodied in your sobriety! Your love of "reality," for example--oh, that is an old, primitive "love"! In every feeling, in every sense-impression, there is a portion of this old love: and similarly also some kind of fantasy, prejudice, irrationality, ignorance, fear, and whatever else has become mingled and woven into it. There is that mountain! There is that cloud! What is "real" in them? Remove the phantasm and the whole human _element_ therefrom, ye sober ones! Yes, if ye could do _that!_ If ye could forget your origin, your past, your preparatory schooling,--your whole history as man and beast! There is no "reality" for us--nor for you either, ye sober ones,--we are far from being so alien to one another as ye suppose; and perhaps our good-will to get beyond drunkenness is just as respectable as your belief that ye are altogether _incapable_ of drunkenness.

[1] Schiller's poem, "The Veiled Image of Sais," is again referred to here.--TR.

58.

Only as Creators!--It has caused me the greatest trouble, and for ever causes me the greatest trouble, to perceive that unspeakably more depends upon _what things are called,_ than on what they are. The reputation, the name and appearance, the importance, the usual measure and weight of things--each being in origin most frequently an error and arbitrariness thrown over the things like a garment, and quite alien to their essence and even to their exterior--have gradually, by the belief therein and its continuous growth from generation to generation, grown as it were on-and-into things and become their very body; the appearance at the very beginning becomes almost always the essence in the end, and _operates_ as the essence! What a fool he would be who would think it enough to refer here to this origin and this nebulous veil of illusion, in order to _annihilate_ that which virtually passes for the world--namely, so-called "reality"! It is only as creators that we can annihilate!--But let us not forget this: it suffices to create new names and valuations and probabilities, in order in the long run to create new "things."

59.

We Artists!--When we love a woman we have readily a hatred against nature, on recollecting all the disagreeable natural functions to which every woman is subject; we prefer not to think of them at all, but if once our soul touches on these things it twitches impatiently, and glances, as we have said, contemptuously at nature:--we are hurt; nature seems to encroach upon our possessions, and with the profanest hands. We then shut our ears against all physiology, and we decree in secret that "we will hear nothing of the fact that man is something else than _soul and form!"_ "The man under the skin" is an abomination and monstrosity, a blasphemy of God and of love to all lovers.--Well, just as the lover still feels with respect to nature and natural functions, so did every worshipper of God and his "holy omnipotence" feel formerly: in all that was said of nature by astronomers, geologists, physiologists, and physicians, he saw an encroachment on his most precious possession, and consequently an attack,--and moreover also an impertinence of the assailant! The "law of nature" sounded to him as blasphemy against God; in truth he would too willingly have seen the whole of mechanics traced back to moral acts of volition and arbitrariness:--but because nobody could render him this service, he _concealed_ nature and mechanism from himself as best he could, and lived in a dream. Oh, those men of former times understood how to _dream,_ and did not need first to go to sleep!--and we men of the present day also still understand it too well, with all our good-will for wakefulness and daylight! It suffices to love, to hate, to desire, and in general to feel _immediately_ the spirit and the power of the dream come over us, and we ascend, with open eyes and indifferent to all danger, the most dangerous paths, to the roofs and towers of fantasy, and without any giddiness, as persons born for climbing--we the night-walkers by day! We artists! We concealers of naturalness! We moon-struck and God-struck ones! We death-silent, untiring wanderers on heights which we do not see as heights, but as our plains, as our places of safety!

60.

Women and their Effect in the Distance.--Have I still ears? Am I only ear, and nothing else besides? Here I stand in the midst of the surging of the breakers, whose white flames fork up to my feet;--from all sides there is howling, threatening, crying, and screaming at me, while in the lowest depths the old earth-shaker sings his aria hollow like a roaring bull; he beats such an earth-shaker's measure thereto, that even the hearts of these weathered rock-monsters tremble at the sound. Then, suddenly, as if born out of nothingness, there appears before the portal of this hellish labyrinth, only a few fathoms distant,--a great sailing-ship gliding silently along like a ghost. Oh, this ghostly beauty! With what enchantment it seizes me! What? Has all the repose and silence in the world embarked here? Does my happiness itself sit in this quiet place, my happier ego, my second immortalised self? Still not dead, but also no longer living? As a ghost-like, calm, gazing, gliding, sweeping, neutral being? Similar to the ship, which, with its white sails, like an immense butterfly, passes over the dark sea! Yes! Passing _over_ existence! That is it! That would be it!--It seems that the noise here has made me a visionary? All great noise causes one to place happiness in the calm and the distance. When a man is in the midst of _his_ hubbub, in the midst of the breakers of his plots and plans, he there sees perhaps calm, enchanting beings glide past him, for whose happiness and retirement he longs--_they are women._ He almost thinks that there with the women dwells his better self; that in these calm places even the loudest breakers become still as death, and life itself a dream of life. But still! but still! my noble enthusiast, there is also in the most beautiful sailing-ship so much noise and bustling, and alas, so much petty, pitiable bustling! The enchantment and the most powerful effect of women is, to use the language of philosophers, an effect at a distance, an _actio in distans;_ there belongs thereto, however, primarily and above all,--_distance!_

6l.

In Honour of Friendship.--That the sentiment of friendship was regarded by antiquity as the highest sentiment, higher even than the most vaunted pride of the self-sufficient and wise, yea, as it were its sole and still holier brotherhood, is very well expressed by the story of the Macedonian king who made the present of a talent to a cynical Athenian philosopher from whom he received it back again. "What?" said the king, "has he then no friend?" He therewith meant to say, "I honour this pride of the wise and independent man, but I should have honoured his humanity still higher, if the friend in him had gained the victory over his pride. The philosopher has lowered himself in my estimation, for he showed that he did not know one of the two highest sentiments--and in fact the higher of them!"

62.

_Love.--_Love pardons even the passion of the beloved.

63.

Woman in Music--How does it happen that warm and rainy winds bring the musical mood and the inventive delight in melody with them? Are they not the same winds that fill the churches and give women amorous thoughts?

64.

Sceptics.--I fear that women who have grown old are more sceptical in the secret recesses of their hearts than any of the men; they believe in the superficiality of existence as in its essence, and all virtue and profundity is to them only the disguising of this "truth," the very desirable disguising of a _pudendum,_--an affair, therefore, of decency and modesty, and nothing more!

65.

Devotedness.--There are noble women with a certain poverty of spirit, who, in order to _express_ their profoundest devotedness, have no other alternative but to offer their virtue and modesty: it is the highest thing they have. And this present is often accepted without putting the recipient under such deep obligation as the giver supposed,--a very melancholy story!

66.

_The Strength of the Weak.--_Women are all skilful in exaggerating their weaknesses, indeed they are inventive in weaknesses, so as to seem quite fragile ornaments to which even a grain of dust does harm; their existence is meant to bring home to man's mind his coarseness, and to appeal to his conscience. They thus defend themselves against the strong and all "rights of might."

67.

Self-dissembling.--She loves him now and has since been looking forth with as quiet confidence as a cow; but alas! It was precisely his delight that she seemed so fitful and absolutely incomprehensible! He had rather too much steady weather in himself already! Would she not do well to feign her old character? to feign indifference? Does not--love itself advise her _to do so? Vivat comœdia!_

68.

Will and Willingness.--Some one brought a youth to a wise man, and said, "See, this is one who is being corrupted by women!" The wise man shook his head and smiled. "It is men," he called out, "who corrupt women; and everything that women lack should be atoned for and improved in men--for man creates for himself the ideal of woman, and woman moulds herself according to this ideal."--"You are too tender-hearted towards women," said one of the bystanders, "you do not know them!" The wise man answered: "Man's attribute is will, woman's attribute is willingness--such is the law of the sexes, verily! a hard law for woman! All human beings are innocent of their existence, women, however, are doubly innocent; who could have enough of salve and gentleness for them!"--"What about salve! What about gentleness!" called out another person in the crowd, "we must educate women better!"--"We must educate men better," said the wise man, and made a sign to the youth to follow him.--The youth, however, did not follow him.

69.

_Capacity for Revenge--_That a person cannot and consequently will not defend himself, does not yet cast disgrace upon him in our eyes; but we despise the person who has neither the ability nor the good-will for revenge--whether it be a man or a woman. Would a woman be able to captivate us (or, as people say, to "fetter" us) whom we did not credit with knowing how to employ the dagger (any kind of dagger) skilfully _against us_ under certain circumstances? Or against herself; which in a certain case might be the severest revenge (the Chinese revenge).

70.

_The Mistresses of the Masters--_A powerful contralto voice, as we occasionally hear it in the theatre, raises suddenly for us the curtain on possibilities in which we usually do not believe; all at once we are convinced that somewhere in the world there may be women with high, heroic, royal souls, capable and prepared for magnificent remonstrances, resolutions, and self-sacrifices, capable and prepared for domination over men, because in them the best in man, superior to sex, has become a corporeal ideal. To be sure, it is not the intention of the theatre that such voices should give such a conception of women; they are usually intended to represent the ideal male lover, for example, a Romeo; but, to judge by my experience, the theatre regularly miscalculates here, and the musician also, who expects such effects from such a voice. People do not believe in _these_ lovers; these voices still contain a tinge of the motherly and housewifely character, and most of all when love is in their tone.

71.

_On Female Chastity.--_There is something quite astonishing and extraordinary in the education of women of the higher class; indeed, there is perhaps nothing more paradoxical. All the world is agreed to educate them with as much ignorance as possible _in eroticis,_ and to inspire their soul with a profound shame of such things, and the extremest impatience and horror at the suggestion of them. It is really here only that all the "honour" of woman is at stake; what would one not forgive them in other respects! But here they are intended to remain ignorant to the very backbone:--they are intended to have neither eyes, ears, words, nor thoughts for this, their "wickedness"; indeed knowledge here is already evil. And then! To be hurled as with an awful thunderbolt into reality and knowledge with marriage--and indeed by him whom they most love and esteem: to have to encounter love and shame in contradiction, yea, to have to feel rapture, abandonment, duty, sympathy, and fright at the unexpected proximity of God and animal, and whatever else besides! all at once!--There, in fact, a psychic entanglement has been effected which is quite unequalled! Even the sympathetic curiosity of the wisest discerner of men does not suffice to divine how this or that woman gets along with the solution of this enigma and the enigma of this solution; what dreadful, far-reaching suspicions must awaken thereby in the poor unhinged soul; and forsooth, how the ultimate philosophy and scepticism of the woman casts anchor at this point!--Afterwards the same profound silence as before and often even a silence to herself, a shutting of her eyes to herself.--Young wives on that account make great efforts to appear superficial and thoughtless the most ingenious of them simulate a kind of impudence.--Wives easily feel their husbands as a question-mark to their honour, and their children as an apology or atonement,--they require children, and wish for them in quite another spirit than a husband wishes for them.--In short, one cannot be gentle enough towards women!

72.

Mothers.--Animals think differently from men with respect to females; with them the female is regarded as the productive being. There is no paternal love among them, but there is such a thing as love of the children of a beloved, and habituation to them. In the young, the females find gratification for their lust of dominion; the young are a property, an occupation, something quite comprehensible to them, with which they can chatter: all this conjointly is maternal love,--it is to be compared to the love of the artist for his work. Pregnancy has made the females gentler, more expectant, more timid, more submissively inclined; and similarly intellectual pregnancy engenders the character of the contemplative, who are allied to women in character:--they are the masculine mothers.--Among animals the masculine sex is regarded as the beautiful sex.

73.

_Saintly Cruelty.--_A man holding a newly born child in his hands came to a saint. "What should I do with this child," he asked, "it is wretched, deformed, and has not even enough of life to die" "Kill it," cried the saint with a dreadful voice, "kill it, and then hold it in thy arms for three days and three nights to brand it on thy memory:--thus wilt thou never again beget a child when it is not the time for thee to beget."--When the man had heard this he went away disappointed; and many found fault with the saint because he had advised cruelty; for he had advised to kill the child. "But is it not more cruel to let it live?" asked the saint.

74.

_The Unsuccessful--_Those poor women always fail of success who become agitated and uncertain, and talk too much in presence of him whom they love; for men are most successfully seduced by a certain subtle and phlegmatic tenderness.

75.

The Third Sex.--"A small man is a paradox, but still a man,--but a small woman seems to me to be of another sex in comparison with well-grown ones"--said an old dancing-master. A small woman is never beautiful--said old Aristotle.

76.

The greatest Danger.--Had there not at all times been a larger number of men who regarded the cultivation of their mind--their "rationality"--as their pride, their obligation, their virtue, and were injured or shamed by all play of fancy and extravagance of thinking--as lovers of "sound common sense":--mankind would long ago have perished! Incipient _insanity_ has hovered, and hovers continually over mankind as its greatest danger: it is precisely the breaking out of inclination in feeling, seeing, and hearing; the enjoyment of the unruliness of the mind; the delight in human unreason. It is not truth and certainty that is the antithesis of the world of the insane, but the universality and all-obligatoriness of a belief, in short, non-voluntariness in forming opinions. And the greatest labour of human beings hitherto has been to agree with one another regarding a number of things, and to impose upon themselves a _law of agreement_--indifferent whether these things are true or false. This is the discipline of the mind which has preserved mankind;--but the counter-impulses are still so powerful that one can really speak of the future of mankind with little confidence. The ideas of things still continually shift and move, and will perhaps alter more than ever in the future; it is continually the most select spirits themselves who strive against universal obligatoriness--the investigators of _truth_ above all! The accepted belief, as the belief of all the world, continually engenders a disgust and a new longing in the more ingenious minds; and already the slow _tempo_ which it demands for all intellectual processes (the imitation of the tortoise, which is here recognised as the rule) makes the artists and poets runaways:--it is in these impatient spirits that a downright delight in delirium breaks out, because delirium has such a joyful _tempo!_ Virtuous intellects, therefore, are needed--ah! I want to use the least ambiguous word,--_virtuous stupidity_ is needed, imperturbable conductors of the _slow_ spirits are needed, in order that the faithful of the great collective belief may remain with one another and dance their dance further: it is a necessity of the first importance that here enjoins and demands. _We others are the exceptions and the danger,_--we eternally need protection--Well, there can actually be something said in favour of the exceptions _provided that they never want to become the rule._

77.

The Animal with good Conscience.--It is not unknown to me that there is vulgarity in everything that pleases Southern Europe--whether it be Italian opera (for example, Rossini's and Bellini's), or the Spanish adventure-romance (most readily accessible to us in the French garb of Gil Blas)--but it does not offend me, any more than the vulgarity which one encounters in a walk through Pompeii, or even in the reading of every ancient book: what is the reason of this? Is it because shame is lacking here, and because the vulgar always comes forward just as sure and certain of itself as anything noble, lovely, and passionate in the same kind of music or romance? "The animal has its rights like man, so let it run about freely; and you, my dear fellow-man, are still this animal, in spite of all!"--that seems to me the moral of the case, and the peculiarity of southern humanity. Bad taste has its rights like good taste, and even a prerogative over the latter when it is the great requisite, the sure satisfaction, and as it were a universal language, an immediately intelligible mask and attitude; the excellent, select taste on the other hand has always something of a seeking, tentative character, not fully certain that it understands,--it is never, and has never been popular! The _masque_ is and remains popular! So let all this masquerade run along in the melodies and cadences, in the leaps and merriment of the rhythm of these operas! Quite the ancient life! What does one understand of it, if one does not understand the delight in the masque, the good conscience of all masquerade! Here is the bath and the refreshment of the ancient spirit:--and perhaps this bath was still more necessary for the rare and sublime natures of the ancient world than for the vulgar.--On the other hand, a vulgar turn in northern works, for example in German music, offends me unutterably. There is _shame_ in it, the artist has lowered himself in his own sight, and could not even avoid blushing: we are ashamed with him, and are so hurt because we surmise that he believed he had to lower himself on our account.

78.

_What we should be Grateful for.--_It is only the artists, and especially the theatrical artists, who have furnished men with eyes and ears to hear and see with some pleasure what everyone is in himself, what he experiences and aims at: it is only _they_ who have taught us how to estimate the hero that is concealed in each of these common-place men, and the art of looking at ourselves from a distance as heroes, and as it were simplified and transfigured--the art of "putting ourselves on the stage" before ourselves. It is thus only that we get beyond some of the paltry details in ourselves! Without that art we should be nothing but foreground, and would live absolutely under the spell of the perspective which makes the closest and the commonest seem immensely large and like reality in itself.--Perhaps there is merit of a similar kind in the religion which commanded us to look at the sinfulness of every individual man with a magnifying-glass, and made a great, immortal criminal of the sinner; in that it put eternal perspectives around man, it taught him to see himself from a distance, and as something past, something entire.

79.

_The Charm of Imperfection.--_I see here a poet, who, like so many men, exercises a higher charm by his imperfections than by all that is rounded off and takes perfect shape under his hands,--indeed, he derives his advantage and reputation far more from his actual limitations than from his abundant powers. His work never expresses altogether what he would really like to express, what he _would like to have seen:_ he appears to have had the foretaste of a vision and never the vision itself:--but an extraordinary longing for this vision has remained in his soul; and from this he derives his equally extraordinary eloquence of longing and craving. With this he raises those who listen to him above his work and above all "works," and gives them wings to rise higher than hearers have ever risen before, thus making them poets and seers themselves; they then show an admiration for the originator of their happiness, as if he had led them immediately to the vision of his holiest and ultimate verities, as if he had reached his goal, and had actually _seen_ and communicated his vision. It is to the advantage of his reputation that he has not really arrived at his goal.

80.

Art and Nature.--The Greeks (or at least the Athenians) liked to hear good talking: indeed they had an eager inclination for it, which distinguished them more than anything else from non-Greeks. And so they required good talking even from passion on the stage, and submitted to the unnaturalness of dramatic verse with delight:--in nature, forsooth, passion is so sparing of words! so dumb and confused! Or if it finds words, so embarrassed and irrational and a shame to itself! We have now, all of us, thanks to the Greeks, accustomed ourselves to this unnaturalness on the stage, as we endure that other unnaturalness, the _singing_ passion, and willingly endure it, thanks to the Italians.--It has become a necessity to us, which we cannot satisfy out of the resources of actuality, to hear men talk well and in full detail in the most trying situations: it enraptures us at present when the tragic hero still finds words, reasons, eloquent gestures, and on the whole a bright spirituality, where life approaches the abysses, and where the actual man mostly loses his head, and certainly his fine language. This kind of _deviation from nature_ is perhaps the most agreeable repast for man's pride: he loves art generally on account of it, as the expression of high, heroic unnaturalness and convention. One rightly objects to the dramatic poet when he does not transform everything into reason and speech, but always retains a remnant of _silence:_--just as one is dissatisfied with an operatic musician who cannot find a melody for the highest emotion, but only an emotional, "natural" stammering and crying. Here nature _has to_ be contradicted! Here the common charm of illusion _has to_ give place to a higher charm! The Greeks go far, far in this direction--frightfully far! As they constructed the stage as narrow as possible and dispensed with all the effect of deep backgrounds, as they made pantomime and easy motion impossible to the actor, and transformed him into a solemn, stiff, masked bogey, so they have also deprived passion itself of its deep background, and have dictated to it a law of fine talk; indeed, they have really done everything to counteract the elementary effect of representations that inspire pity and terror: _they did not want pity and terror,_--with due deference, with the highest deference to Aristotle! but he certainly did not hit the nail, to say nothing of the head of the nail, when he spoke about the final aim of Greek tragedy! Let us but look at the Grecian tragic poets with respect to _what_ most excited their diligence, their inventiveness, and their emulation,--certainly it was not the intention of subjugating the spectators by emotion! The Athenian went to the theatre _to hear fine talking!_ And fine talking was arrived at by Sophocles!--pardon me this heresy!--It is very different with _serious opera:_ all its masters make it their business to prevent their personages being understood. "An occasional word picked up may come to the assistance of the inattentive listener; but on the whole the situation must be self-explanatory,--the _talking_ is of no account!"--so they all think, and so they have all made fun of the words. Perhaps they have only lacked courage to express fully their extreme contempt for words: a little additional insolence in Rossini, and he would have allowed la-la-la-la to be sung throughout--and it might have been the rational course! The personages of the opera are _not_ meant to be believed "in their words," but in their tones! That is the difference, that is the fine _unnaturalness_ on account of which people go to the opera! Even the _recitativo secco_ is not really intended to be heard as words and text: this kind of half-music is meant rather in the first place to

give the musical ear a little repose (the repose from _melody,_ as from the sublimest, and on that account the most straining enjoyment of this art),--but very soon something different results, namely, an increasing impatience, an increasing resistance, a new longing for _entire_ music, for melody.--How is it with the art of Richard Wagner as seen from this standpoint? Is it perhaps the same? Perhaps otherwise? It would often seem to me as if one needed to have learned by heart both the words _and_ the music of his creations before the performances; for without that--so it seemed to me--me _may hear_ neither the words, nor even the music.

81.

Grecian Taste--"What is beautiful in it?"--asked a certain geometrician, after a performance of the _Iphigenia--_"there is nothing proved in it!" Could the Greeks have been so far from this taste? In Sophocles at least "everything is proved."

82.

Esprit Un-Grecian.--The Greeks were exceedingly logical and plain in all their thinking; they did not get tired of it, at least during their long flourishing period, as is so often the case with the French; who too willingly made a little excursion into the opposite, and in fact endure the spirit of logic only when it betrays its _sociable_ courtesy, its sociable self-renunciation, by a multitude of such little excursions into its opposite. Logic appears to them as necessary as bread and water, but also like these as a kind of prison-fare, as soon as it is to be taken pure and by itself. In good society one must never want to be in the right absolutely and solely, as all pure logic requires; hence the little dose of irrationality in all French _esprit_.--The social sense of the Greeks was far less developed than that of the French in the present and the past; hence, so little _esprit_ in their cleverest men, hence, so little wit, even in their wags, hence--alas! But people will not readily believe these tenets of mine, and how much of the kind I have still on my soul!--_Est res magna tacere_--says Martial, like all garrulous people.

83.

Translations.--One can estimate the amount of the historical sense which an age possesses by the way in which it makes _translations_ and seeks to embody in itself past periods and literatures. The French of Corneille, and even the French of the Revolution, appropriated Roman antiquity in a manner for which we would no longer have the courage--owing to our superior historical sense. And Roman antiquity itself: how violently, and at the same time how naïvely, did it lay its hand on everything excellent and elevated belonging to the older Grecian antiquity! How they translated these writings into the Roman present! How they wiped away intentionally and unconcernedly the wing-dust of the butterfly moment! It is thus that Horace now and then translated Alcæus or Archilochus, it is thus that Propertius translated Callimachus and Philetas (poets of equal rank with Theocritus, if we _be allowed_ to judge): of what consequence was it to them that the actual creator experienced this and that, and had inscribed the indication thereof in his poem!--as poets they were averse to the antiquarian, inquisitive spirit which precedes the historical sense; as poets they did not respect those essentially personal traits and names, nor anything peculiar to city, coast, or century, such as its costume and mask, but at once put the present and the Roman in its place. They seem to us to ask: "Should we not make the old new for ourselves, and adjust _ourselves_ to it? Should we not be allowed to inspire this dead body with our soul? for it is dead indeed: how loathsome is everything dead!"--They did not know the pleasure of the historical sense; the past and the alien was painful to them, and as Romans it was an incitement to a Roman conquest. In fact, they conquered when they translated,--not only in that they omitted the historical: they added also allusions to the present; above all, they struck out the name of the poet and put their own in its place--not with the feeling of theft, but with the very best conscience of the _Imperium Romanum_.

84.

_The Origin of Poetry.--_The lovers of the fantastic in man, who at the same time represent the doctrine of instinctive morality, draw this conclusion: "Granted that utility has been honoured at all times as the highest divinity, where then in all the world has poetry come from?--this rhythmising of speech which thwarts rather than furthers plainness of communication, and which, nevertheless, has sprung up everywhere on the earth, and still springs up, as a mockery of all useful purpose! The wildly beautiful irrationality of poetry refutes you, ye utilitarians! The wish _to get rid of_ utility in some way--that is precisely what has elevated man, that is what has inspired him to morality and art!" Well, I must here speak for once to please the utilitarians,--they are so seldom in the right that it is pitiful! In the old times which called poetry into being, people had still utility in view with respect to it, and a very important utility--at the time when rhythm was introduced into speech, that force which arranges all the particles of the sentence anew, commands the choosing of the words, recolours the thought, and makes it more obscure, more foreign, and more distant: to be

sure a _superstitious utility!_ It was intended that a human entreaty should be more profoundly impressed upon the Gods by virtue of rhythm, after it had been observed that men could remember a verse better than an unmetrical speech. It was likewise thought that people could make themselves audible at greater distances by the rhythmical beat; the rhythmical prayer seemed to come nearer to the ear of the Gods. Above all, however, people wanted to have the advantage of the elementary conquest which man experiences in himself when he hears music: rhythm is a constraint; it produces an unconquerable desire to yield, to join in; not only the step of the foot, but also the soul itself follows the measure,--probably the soul of the Gods also, as people thought! They attempted, therefore, to _constrain_ the Gods by rhythm, and to exercise a power over them; they threw poetry around the Gods like a magic noose. There was a still more wonderful idea, and it has perhaps operated most powerfully of all in the originating of poetry. Among the Pythagoreans it made its appearance as a philosophical doctrine and as an artifice of teaching: but long before there were philosophers music was acknowledged to possess the power of unburdening the emotions, of purifying the soul, of soothing the _ferocia animi_--and this was owing to the rhythmical element in music. When the proper tension and harmony of the soul were lost a person had to _dance_ to the measure of the singer,--that was the recipe of this medical art. By means of it Terpander quieted a tumult, Empedocles calmed a maniac, Damon purged a love-sick youth; by means of it even the maddened, revengeful Gods were treated for the purpose of a cure. This was effected by driving the frenzy and wantonness of their emotions to the highest pitch, by making the furious mad, and the revengeful intoxicated with vengeance all the orgiastic cults seek to discharge the _ferocia_ of a deity all at once, and thus make an orgy, so that the deity may feel freer and quieter afterwards, and leave man in peace. _Melos,_ according to its root, signifies a soothing agency, not because the song is gentle itself, but because its after-effect is gentle.--And not only in the religious song, but also in the secular song of the most ancient times, the prerequisite is that the rhythm should exercise a magical influence; for example, in drawing water, or in rowing: the song is for the enchanting of the spirits supposed to be active thereby; it makes them obliging, involuntary and the instruments of man. And as often as a person acts he has occasion to sing, _every_ action is dependent on the assistance of spirits: magic song and incantation appear to be the original form of poetry. When verse also came to be used in oracles--the Greeks said that the hexameter was invented at Delphi,--the rhythm was here also intended to exercise a compulsory influence. To make a prophecy--that means originally (according to what seems to me the probable derivation of the Greek word) to determine something; people thought they could determine the future by winning Apollo over to their side: he who, according to the most ancient idea, is far more than a foreseeing deity. According as the formula is pronounced with literal and rhythmical correctness, it determines the future: the formula, however, is the invention of Apollo, who as the God of rhythm, can also determine the goddesses of fate--Looked at and investigated as a whole, was there ever anything _more serviceable_ to the ancient superstitious species of human being than rhythm? People could do everything with it: they could make labour go on magically; they could compel a God to appear, to be near at hand, and listen to them; they could arrange the future for themselves according to their will; they could unburden their own souls of any kind of excess (of anxiety, of mania, of sympathy, of revenge), and not only their own souls, but the souls of the most evil spirits,--without verse a person was nothing, by means of verse a person became almost a God. Such a fundamental feeling no longer allows itself to be fully eradicated,--and even now, after millenniums of long labour in combating such superstition, the very wisest of us occasionally becomes the fool of rhythm, be it only that one _perceives_ a thought to be _truer_ when it has a metrical form and approaches with a divine hopping. Is it not a very funny thing that the most serious philosophers, however anxious they are in other respects for strict certainty, still appeal to _poetical sayings_ in order to give their thoughts force and credibility? and yet it is more dangerous to a truth when the poet assents to it than when he contradicts it! For, as Homer says, "Minstrels speak much falsehood!"--

85.

The Good and the Beautiful.--Artists, glorify continually--they do nothing else,--and indeed they glorify all those conditions and things that have a reputation, so that man may feel himself good or great, or intoxicated, or merry, or pleased and wise by it. Those _select_ things and conditions whose value for human _happiness_ is regarded as secure and determined, are the objects of artists: they are ever lying in wait to discover such things, to transfer them into the domain of art. I mean to say that they are not themselves the valuers of happiness and of the happy ones, but they always press close to these valuers with the greatest curiosity and longing, in order immediately to use their valuations advantageously. As besides their impatience, they have also the big lungs of heralds and the feet of runners, they are generally always among the first to glorify the _new_ excellency, and often _seem_ to be the first who have called it good and valued it as good. This, however, as we have said, is an error; they are only faster and louder than the actual valuers:--And who then are these?--They are the rich and the leisurely.

86.

_The Theatre.--_This day has given me once more strong and elevated sentiments, and if I could have music and art in the evening, I know well what music and art I should _not_ like to have; namely, none of that which would fain intoxicate its hearers and _excite_ them to a crisis of strong and high feeling,--those men with commonplace souls, who in the evening are not like victors on triumphal cars, but like tired mules to whom life has rather too often applied the whip. What would those men at all know of "higher moods," unless there were expedients for causing ecstasy and idealistic strokes of the whip!--and thus they have their inspirers as they have their wines. But what is their drink and their drunkenness to _me!_ Does the inspired one need wine? He rather looks with a kind of disgust at the agency and the agent which are here intended to produce an effect without sufficient reason,--an imitation of the high tide of the soul! What? One gives the mole wings and proud fancies--before going to sleep, before he creeps into his hole? One sends him into the theatre and puts great magnifying-glasses to his blind and tired eyes? Men, whose life is not "action" but business, sit in front of the stage and look at strange beings to whom life is more than business? "This is proper," you say, "this is entertaining, this is what culture wants!"--Well then! culture is too often lacking in me, for this sight is too often disgusting to me. He who has enough of tragedy and comedy in himself surely prefers to remain away from the theatre; or as an exception, the whole procedure--theatre and public and poet included--becomes for him a truly tragic and comic play, so that the performed piece counts for little in comparison. He who is something like Faust and Manfred, what does it matter to him about the Fausts and Manfreds of the theatre!--while it certainly gives him something to think about _that_ such figures are brought into the theatre at all. The _strongest_ thoughts and passions before those who are not capable of thought and passion--but of _intoxication_ only! And _those_ as a means to this end! And theatre and music the hashish-smoking and betel-chewing of Europeans! Oh, who will narrate to us the whole history of narcotics!--It is almost the history of "culture," the so-called higher culture!

87.

_The Conceit of Artists._I think artists often do not know what they can do best, because they are too conceited, and have set their minds on something loftier than those little plants appear to be, which can grow up to perfection on their soil, fresh, rare, and beautiful. The final value of their own garden and vineyard is superciliously underestimated by them, and their love and their insight are not of the same quality. Here is a musician, who, more than any one else, has the genius for discovering the tones peculiar to suffering, oppressed, tortured souls, and who can endow even dumb animals with speech. No one equals him in the colours of the late autumn, in the indescribably touching happiness of a last, a final, and all too short enjoyment; he knows a chord for those secret and weird midnights of the soul when cause and effect seem out of joint, and when every instant something may originate "out of nothing." He draws his resources best of all out of the lower depths of human happiness, and so to speak, out of its drained goblet, where the bitterest and most nauseous drops have ultimately, for good or for ill, commingled with the sweetest. He knows the weary shuffling along of the soul which can no longer leap or fly, yea, not even walk; he has the shy glance of concealed pain, of understanding without comfort, of leave-taking without avowal; yea, as the Orpheus of all secret misery, he is greater than anyone; and in fact much has been added to art by him which was hitherto inexpressible and not even thought worthy of art, and which was only to be scared away, by words, and not grasped many small and quite microscopic features of the soul: yes, he is the master of miniature. But he does not _wish_ to be so! His _character_ is more in love with large walls and daring frescoes! He fails to see that his _spirit_ has a different taste and inclination, and prefers to sit quietly in the corners of ruined houses:--concealed in this way, concealed even from himself, he there paints his proper masterpieces, all of which are very short, often only one bar in length,--there only does he become quite good, great, and perfect, perhaps there only.--But he does not know it! He is too conceited to know it.

88.

Earnestness for the Truth.--Earnest for the truth! What different things men understand by these words! Just the same opinions, and modes of demonstration and testing which a thinker regards as a frivolity in himself, to which he has succumbed with shame at one time or other,--just the same opinions may give to an artist, who comes in contact with them and accepts them temporarily, the consciousness that the profoundest earnestness for the truth has now taken hold of him, and that it is worthy of admiration that, although an artist, he at the same time exhibits the most ardent desire for the antithesis of the apparent. It is thus possible that a person may, just by his pathos of earnestness, betray how superficially and sparingly his intellect has hitherto operated in the domain of knowledge.--And is not everything that we consider _important_ our betrayer? It shows where our motives lie, and where our motives are altogether lacking.

89.

Now and Formerly.--Of what consequence is all our art in artistic products, if that higher art, the art of the festival, be lost by us? Formerly all artistic products were exhibited on the great festive-path of humanity, as tokens of remembrance, and monuments of high and happy moments. One now seeks to allure the exhausted and sickly from the great suffering-path of humanity for a wanton moment by means of works of art; one furnishes them with a little ecstasy and insanity.

90.

_Lights and Shades.--_Books and writings are different with different thinkers. One writer has collected together in his book all the rays of light which he could quickly plunder and carry home from an illuminating experience; while another gives only the shadows, and the grey and black replicas of that which on the previous day had towered up in his soul.

91.

_Precaution.--_Alfieri, as is well known, told a great many falsehoods when he narrated the history of his life to his astonished contemporaries. He told falsehoods owing to the despotism toward himself which he exhibited, for example, in the way in which he created his own language, and tyrannised himself into a poet:--he finally found a rigid form of sublimity into which he _forced_ his life and his memory; he must have suffered much in the process.--I would also give no credit to a history of Plato's life written by himself, as little as to Rousseau's, or to the _Vita nuova_ of Dante.

92.

Prose and Poetry.--Let it be observed that the great masters of prose have almost always been poets as well, whether openly, or only in secret and for the "closet"; and in truth one only writes good prose _in view of poetry!_ For prose is an uninterrupted, polite warfare with poetry; all its charm consists in the fact that poetry is constantly avoided and contradicted; every abstraction wants to have a gibe at poetry, and wishes to be uttered with a mocking voice; all dryness and coolness is meant to bring the amiable goddess into an amiable despair; there are often approximations and reconciliations for the moment, and then a sudden recoil and a burst of laughter; the curtain is often drawn up and dazzling light let in just while the goddess is enjoying her twilights and dull colours; the word is often taken out of her mouth and chanted to a melody while she holds her fine hands before her delicate little ears:--and so there are a thousand enjoyments of the warfare, the defeats included, of which the unpoetic, the so-called prose--men know nothing at all:--they consequently write and speak only bad prose! _Warfare is the father of all good things,_ it is also the father of good prose!--There have been four very singular and truly poetical men in this century who have arrived at mastership in prose, for which otherwise this century is not suited, owing to lack of poetry, as we have indicated. Not to take Goethe into account, for he is reasonably claimed by the century that produced him, I look only on Giacomo Leopardi, Prosper Mérimée, Ralph Waldo Emerson, and Walter Savage Landor the author of _Imaginary Conversations,_ as worthy to be called masters of prose.

93.

But why, then, do you Write?--A: I do not belong to those who _think_ with the wet pen in hand; and still less to those who yield themselves entirely to their passions before the open ink-bottle, sitting on their chair and staring at the paper. I am always vexed and abashed by writing; writing is a necessity for me,--even to speak of it in a simile is disagreeable. B: But why, then, do you write? A: Well, my dear Sir, to tell you in confidence, I have hitherto found no other means of _getting rid of_ my thoughts. B: And why do you wish to get rid of them? A: Why I wish? Do I really wish! I must--B: Enough! Enough!

94.

Growth after Death.--Those few daring words about moral matters which Fontenelle threw into his immortal _Dialogues of the Dead,_ were regarded by his age as paradoxes and amusements of a not unscrupulous wit; even the highest judges of taste and intellect saw nothing more in them,--indeed, Fontenelle himself perhaps saw nothing more. Then something incredible takes place: these thoughts become truths! Science proves them! The game becomes serious! And we read those dialogues with a feeling different from that with which Voltaire and Helvetius read them, and we involuntarily raise their originator into another and _much higher_ class of intellects than they did.--Rightly?' Wrongly?

95.

Chamfort.--That such a judge of men and of the multitude as Chamfort should side with the multitude, instead of standing apart in philosophical resignation and defence--I am at a loss to explain this, except as follows:--There was an instinct in him stronger than his wisdom, and it had never been gratified: the hatred against all _noblesse_ of blood; perhaps his mother's old and only too explicable hatred, which was consecrated in him by love of her,--an instinct of revenge from his boyhood, which waited for the hour to avenge his mother. But then the course of his life, his genius, and alas! most of all, perhaps, the paternal blood in his veins, had seduced him to rank and consider himself equal to the _noblesse--_for many, many years! In the end, however, he could not endure the sight of himself, the "old man" under the old _régime,_ any longer; he got into a violent, penitential passion, and _in this state_ he put on the raiment of the populace as _his_ special kind of hair-shirt! His bad conscience was the neglect of revenge.--If Chamfort had then been a little more of the philosopher, the Revolution would not have had its tragic wit and its sharpest sting; it would have been regarded as a much more stupid affair, and would have had no such seductive influence on men's minds. But Chamfort's hatred and revenge educated an entire generation; and the most illustrious men passed through his school. Let us but consider that Mirabeau looked up to Chamfort as to his higher and older self, from whom he expected (and endured) impulses, warnings, and condemnations,--Mirabeau, who as a man belongs to an entirely different order of greatness, as the very foremost among the statesman-geniuses of yesterday and to-day.--Strange, that in spite of such a friend and advocate--we possess Mirabeau's letters to Chamfort--this wittiest of all moralists has remained unfamiliar to the French, quite the same as Stendhal, who has perhaps had the most penetrating eyes and ears of any. Frenchman of _this_ century. Is it because the latter had really too much of the German and the Englishman in his nature for the Parisians to endure him?--while Chamfort, a man with ample knowledge of the profundities and secret motives of the soul, gloomy, suffering, ardent--a thinker who found laughter necessary as the remedy of life, and who almost gave himself up as lost every day that he had not laughed,--seems much more like an Italian, and related by blood to Dante and Leopardi, than like a Frenchman. One knows Chamfort's last words: "_Ah! mon ami,_" he said to Sieyès, "_je m'en vais enfin de ce monde, où il faut que le cœur se brise ou se bronze_--." These were certainly not the words of a dying Frenchman.

96.

_Two Orators.--_Of these two orators the one arrives at a full understanding of his case only when he yields himself to emotion; it is only this that pumps sufficient blood and heat into his brain to compel his high intellectuality to reveal itself The other attempts, indeed, now and then to do the same: to state his case sonorously, vehemently, and spiritedly with the aid of emotion,--but usually with bad success. He then very soon speaks obscurely and confusedly; he exaggerates, makes omissions, and excites suspicion of the justice of his case: indeed, he himself feels this suspicion, and the sudden changes into the coldest and most repulsive tones (which raise a doubt in the hearer as to his passionateness being genuine) are thereby explicable. With him emotion always drowns the spirit; perhaps because it is stronger than in the former. But he is at the height of his power when he resists the impetuous storm of his feeling, and as it were scorns it; it is then only that his spirit emerges fully from its concealment, a spirit logical, mocking and playful, but nevertheless awe-inspiring.

97.

The Loquacity of Authors.--There is a loquacity of anger--frequent in Luther, also in Schopenhauer. A loquacity which comes from too great a store of conceptual formulæ, as in Kant. A loquacity which comes from delight in ever new modifications of the same idea: one finds it in Montaigne. A loquacity of malicious natures: whoever reads writings of our period will recollect two authors in this connection. A loquacity which comes from delight in fine words and forms of speech: by no means rare in Goethe's prose. A loquacity which comes from pure satisfaction in noise and confusion of feelings: for example in Carlyle.

98.

In Honour of Shakespeare.--The best thing I could say in honour of Shakespeare, _the man,_ is that he believed in Brutus, and cast not a shadow of suspicion on the kind of virtue which Brutus represents! It is to him that Shakespeare consecrated his best tragedy--it is at present still called by a wrong name,--to him, and to the most terrible essence of lofty morality. Independence of soul!--that is the question at issue! No sacrifice can be too great there: one must be able to sacrifice to it even one's dearest friend, although he be the grandest of men, the ornament of the world, the genius without peer,--if one really loves freedom as the freedom of great souls, and if _this_ freedom be threatened by him:--it is thus that Shakespeare must have felt! The elevation in which he places Cæsar is the most exquisite honour he could confer upon Brutus; it is thus only that he lifts into vastness the inner problem of his hero, and similarly the strength of soul which could cut _this knot!--_And was it actually political freedom that impelled the

poet to sympathy with Brutus,--and made him the accomplice of Brutus? Or was political freedom merely a symbol for something inexpressible? Do we perhaps stand before some sombre event or adventure of the poet's own soul, which has remained unknown, and of which he only cared to speak symbolically? What is all Hamlet-melancholy in comparison with the melancholy of Brutus!--and perhaps Shakespeare also knew this, as he knew the other, by experience! Perhaps he also had his dark hour and his bad angel, just as Brutus had them!--But whatever similarities and secret relationships of that kind there may have been, Shakespeare cast himself on the ground and felt unworthy and alien in presence of the aspect and virtue of Brutus:--he has inscribed the testimony thereof in the tragedy itself. He has twice brought in a poet in it, and twice heaped upon him such an impatient and extreme contempt, that it sounds like a cry,--like the cry of self-contempt. Brutus, even Brutus loses patience when the poet appears, self-important, pathetic and obtrusive, as poets usually are,--persons who seem to abound in the possibilities of greatness, even moral greatness, and nevertheless rarely attain even to ordinary uprightness in the philosophy of practice and of life "He may know the times, _but I know his temper_,--away with the jigging fool!"--shouts Brutus. We may translate this back into the soul of the poet that composed it.

99.

_The Followers of Schopenhauer.--_What one sees at the contact of civilized peoples with barbarians,--namely, that the lower civilization regularly accepts in the first place the vices, weaknesses and excesses of the higher; then, from that point onward, feels the influence of a charm; and finally, by means of the appropriated vices and weaknesses also allows something of the valuable influence of the higher culture to leaven it:-one can also see this close at hand and without journeys to barbarian peoples, to be sure, somewhat refined and spiritualised, and not so readily palpable. What are the German followers of _Schopenhauer_ still accustomed to receive first of all from their master?--those who, when placed beside his superior culture, must deem themselves sufficiently barbarous to be first of all barbarously fascinated and seduced by him. Is it his hard matter-of-fact sense, his inclination to clearness and rationality, which often makes him appear so English, and so unlike Germans? Or the strength of his intellectual conscience, which _endured_ a life-long contradiction of "being" and "willing," and compelled him to contradict himself constantly even in his writings on almost every point? Or his purity in matters relating to the Church and the Christian God?--for here he was pure as no German philosopher had been hitherto, so that he lived and died "as a Voltairian." Or his immortal doctrines of the intellectuality of intuition, the apriority of the law of causality, the instrumental nature of the intellect, and the non-freedom of the will? No, nothing of this enchants, nor is felt as enchanting; but Schopenhauer's mystical embarrassments and shufflings in those passages where the matter-of-fact thinker allowed himself to be seduced and corrupted by the vain impulse to be the unraveller of the world's riddle: his undemonstrable doctrine of _one will_ ("all causes are merely occasional causes of the phenomenon of the will at such a time and at such a place," "the will to live, whole and undivided, is present in every being, even in the smallest, as perfectly as in the sum of all that was, is, and will be"); his _denial of the individual_ ("all lions are really only one lion," "plurality of individuals is an appearance," as also _development_ is only an appearance: he calls the opinion of Lamarck "an ingenious, absurd error"); his fantasy about _genius_ ("in æsthetic contemplation the individual is no longer an individual, but a pure, will-less, painless, timeless subject of knowledge," "the subject, in that it entirely merges in the contemplated object, has become this object itself"); his nonsense about _sympathy,_ and about the outburst of the _principium individuationis_ thus rendered possible, as the source of all morality; including also such assertions as, "dying is really the design of existence," "the possibility should not be absolutely denied that a magical effect could proceed from a person already dead":--these, and similar _extravagances_ and vices of the philosopher, are always first accepted and made articles of faith; for vices and extravagances are always easiest to imitate, and do not require a long preliminary practice. But let us speak of the most celebrated of the living Schopenhauerians, Richard Wagner.--It has happened to him as it has already happened to many an artist: he made a mistake in the interpretation of the characters he created, and misunderstood the unexpressed philosophy of the art peculiarly his own. Richard Wagner allowed himself to be misled by Hegel's influence till the middle of his life; and he did the same again when later on he read Schopenhauer's doctrine between the lines of his characters, and began to express himself with such terms as "will," "genius," and "sympathy." Nevertheless it will remain true that nothing is more counter to Schopenhauer's spirit than the essentially Wagnerian element in Wagner's heroes: I mean the innocence of the supremest selfishness, the belief in strong passion as the good in itself, in a word, the Siegfried trait in the countenances of his heroes. "All that still smacks more of Spinoza than of me,"--Schopenhauer would probably have said. Whatever good reasons, therefore, Wagner might have had to be on the outlook for other philosophers than Schopenhauer, the enchantment to which he succumbed in respect to this thinker, not only made him blind towards all other philosophers, but even towards science itself; his entire art is more and more inclined to become the counterpart and complement of the Schopenhauerian philosophy, and it always renounces more emphatically the higher ambition to become the counterpart and complement of human knowledge and science. And not only is he allured thereto by the whole mystic pomp of this philosophy

(which would also have allured a Cagliostro), the peculiar airs and emotions of the philosopher have all along been seducing him as well! For example, Wagner's indignation about the corruption of the German language is Schopenhauerian; and if one should commend his imitation in this respect, it is nevertheless not to be denied that Wagner's style itself suffers in no small degree from all the tumours and turgidities, the sight of which made Schopenhauer so furious; and that, in respect to the German-writing Wagnerians, Wagneromania is beginning to be as dangerous as only some kinds of Hegelomania have been. From Schopenhauer comes Wagner's hatred of the Jews, to whom he cannot do justice even in their greatest exploit: are not the Jews the inventors of Christianity! The attempt of Wagner to construe Christianity as a seed blown away from Buddhism, and his endeavour to initiate a Buddhistic era in Europe, under a temporary approximation to Catholic-Christian formulas and sentiments, are both Schopenhauerian. Wagner's preaching in favour of pity in dealing with animals is Schopenhauerian; Schopenhauer's predecessor here, as is well known, was Voltaire, who already perhaps, like his successors, knew how to disguise his hatred of certain men and things as pity towards animals. At least Wagner's hatred of science, which manifests itself in his preaching, has certainly not been inspired by the spirit of charitableness and kindness--nor by the _spirit_ at all, as is sufficiently obvious.--Finally, it is of little importance what the philosophy of an artist is, provided it is only a supplementary philosophy, and does not do any injury to his art itself. We cannot be sufficiently on our guard against taking a dislike to an artist on account of an occasional, perhaps very unfortunate and presumptuous masquerade; let us not forget that the dear artists are all of them something of actors--and must be so; it would be difficult for them to hold out in the long run without stage-playing. Let us be loyal to Wagner in that which is _true_ and original in him,--and especially in this point, that we, his disciples, remain loyal to ourselves in that which is true and original in us. Let us allow him his intellectual humours and spasms, let us in fairness rather consider what strange nutriments and necessaries an art like his _is entitled to,_ in order to be able to live and grow! It is of no account that he is often wrong as a thinker; justice and patience are not _his_ affair. It is sufficient that his life is right in his own eyes, and maintains its right,--the life which calls to each of us: "Be a man, and do not follow me--but thyself! thyself!" _Our_ life, also ought to maintain its right in our own eyes! We also are to grow and blossom out of ourselves, free and fearless, in innocent selfishness! And so, on the contemplation of such a man, these thoughts still ring in my ears to-day, as formerly: "That passion is better than stoicism or hypocrisy; that straight-forwardness, even in evil, is better than losing oneself in trying to observe traditional morality; that the free man is just as able to be good as evil, but that the unemancipated man is a disgrace to nature, and has no share in heavenly or earthly bliss; finally, that _all who wish to be free must become so through themselves,_ and that freedom falls to nobody's lot as a gift from Heaven." (_Richard Wagner in Bayreuth,_ Vol. I. of this Translation, pp. 199-200).

100.

Learning to do Homage.--One must learn the art of homage, as well as the art of contempt. Whoever goes in new paths and has led many persons therein, discovers with astonishment how awkward and incompetent all of them are in the expression of their gratitude, and indeed how rarely gratitude _is able_ even to express itself. It is always as if something comes into people's throats when their gratitude wants to speak so that it only hems and haws, and becomes silent again. The way in which a thinker succeeds in tracing the effect of his thoughts, and their transforming and convulsing power, is almost a comedy: it sometimes seems as if those who have been operated upon felt profoundly injured thereby, and could only assert their independence, which they suspect to be threatened, by all kinds of improprieties. It needs whole generations in order merely to devise a courteous convention of gratefulness; it is only very late that the period arrives when something of spirit and genius enters into gratitude Then there is usually some one who is the great receiver of thanks, not only for the good he himself has done, but mostly for that which has been gradually accumulated by his predecessors, as a treasure of what is highest and best.

101.

Voltaire--Wherever there has been a court, it has furnished the standard of good-speaking and with this also the standard of style for writers The court language, however, is the language of the courtier who _has no profession,_ and who even in conversations on scientific subjects avoids all convenient, technical expressions, because they smack of the profession; on that account the technical expression, and everything that betrays the specialist, is a _blemish of style_ in countries which have a court culture. At present, when all courts have become caricatures of past and present times, one is astonished to find even Voltaire unspeakably reserved and scrupulous on this point (for example, in his judgments concerning such stylists as Fontenelle and Montesquieu),--we are now, all of us, emancipated from court taste, while Voltaire was its _perfecter!_

102.

_A Word for Philologists.--_It is thought that there are books so valuable and royal that whole generations of scholars are well employed when through their efforts these books are kept genuine and intelligible,--to confirm this belief again and again is the purpose of philology. It presupposes that the rare men are not lacking (though they may not be visible), who actually know how to use such valuable books:--those men perhaps who write such books themselves, or could write them. I mean to say that philology presupposes a noble belief,--that for the benefit of some few who are always "to come," and are not there, a very great amount of painful, and even dirty labour has to be done beforehand: it is all labour _in usum Delphinorum_.

103.

German Music.--German music, more than any other, has now become European music; because the changes which Europe experienced through the Revolution have therein alone found expression: it is only German music that knows how to express the agitation of popular masses, the tremendous artificial uproar, which does not even need to be very noisy,--while Italian opera, for example, knows only the choruses of domestics or soldiers, but not "the people." There is the additional fact that in all German music a profound _bourgeois_ jealousy of the _noblesse_ can be traced, especially a jealousy of _esprit_ and _élégance,_ as the expressions of a courtly, chivalrous, ancient, and self-confident society. It is not music like that of Goethe's musician at the gate, which was pleasing also "in the hall," and to the king as well; it is not here said: "The knights looked on with martial air; with bashful eyes the ladies." Even the Graces are not allowed in German music without a touch of remorse; it is only with Pleasantness, the country sister of the Graces that the German begins to feel morally at ease--and from this point up to his enthusiastic, learned, and often gruff "sublimity" (the Beethoven-like sublimity), he feels more and more so. If we want to imagine the man of _this_ music,--well, let us just imagine Beethoven as he appeared beside Goethe, say, at their meeting at Teplitz: as semi-barbarism beside culture, as the masses beside the nobility, as the good-natured man beside the good and more than "good" man, as the visionary beside the artist, as the man needing comfort beside the comforted, as the man given to exaggeration and distrust beside the man of reason, as the crank and self-tormenter, as the foolishly enraptured, blessedly unfortunate, sincerely immoderate man! as the pretentious and awkward man,--and altogether as the "untamed man": it was thus that Goethe conceived and characterised him, Goethe, the exceptional German, for whom a music of equal rank has not yet been found!--Finally, let us consider whether the present continually extending contempt of melody and the stunting of the sense for melody among Germans should not be understood as a democratic impropriety and an after-effect of the Revolution? For melody has such an obvious delight in conformity to law, and such an aversion to everything evolving, unformed and arbitrary, that it sounds like a note out of the _ancient_ European regime, and as a seduction and guidance back to it.

104.

The Tone of the German Language.--We know whence the German originated which for several centuries has been the universal literary language of Germany. The Germans, with their reverence for everything that came from the _court,_ intentionally took the chancery style as their pattern in all that they had to _write,_ especially in their letters, records, wills, &c. To write in the chancery style, that was to write in court and government style,--that was regarded as something select, compared with the language of the city in which a person lived. People gradually drew this inference, and spoke also as they wrote,--they thus became still more select in the forms of their words, in the choice of their terms and modes of expression, and finally also in their tones: they affected a court tone when they spoke, and the affectation at last became natural. Perhaps nothing quite similar has ever happened elsewhere:--the predominance of the literary style over the talk, and the formality and affectation of an entire people becoming the basis of a common and no longer dialectical language. I believe that the sound of the German language in the Middle Ages, and especially after the Middle Ages, was extremely rustic and vulgar; it has ennobled itself somewhat during the last centuries, principally because it was found necessary to imitate so many French, Italian, and Spanish sounds, and particularly on the part of the German (and Austrian) nobility, who could not at all content themselves with their mother-tongue. But notwithstanding this practice, German must have sounded intolerably vulgar to Montaigne, and even to Racine: even at present, in the mouths of travellers among the Italian populace, it still sounds very coarse, sylvan, and hoarse, as if it had originated in smoky rooms and outlandish districts.--Now I notice that at present a similar striving after selectness of tone is spreading among the former admirers of the chancery style, and that the Germans are beginning to accommodate themselves to a peculiar "witchery of sound," which might in the long run become an actual danger to the German language,--for one may seek in vain for more execrable sounds in Europe. Something mocking, cold, indifferent and careless in the voice: that is what at present sounds "noble" to the Germans--and I hear the approval of this nobleness in the voices of young officials, teachers, women, and trades-people; indeed, even the little girls already imitate this German of the officers. For the officer, and in fact the Prussian officer is the inventor of these tones: this same officer, who as soldier and professional man possesses that admirable tact for modesty which the Germans as a whole might

well imitate (German professors and musicians included!). But as soon as he speaks and moves he is the most inmodest and inelegant figure in old Europe--no doubt unconsciously to himself! And unconsciously also to the good Germans, who gaze at him as the man of the foremost and most select society, and willingly let him "give them his tone." And indeed he gives it to them!--in the first place it is the sergeant-majors and non-commissioned officers that imitate his tone and coarsen it. One should note the roars of command, with which the German cities are absolutely surrounded at present, when there is drilling at all the gates: what presumption, furious imperiousness, and mocking coldness speaks in this uproar! Could the Germans actually be a musical people?--It is certain that the Germans martialise themselves at present in the tone of their language: it is probable that, being exercised to speak martially, they will finally write martially also. For habituation to definite tones extends deeply into the character:--people soon have the words and modes of expression, and finally also the thoughts which just suit these tones! Perhaps they already write in the officers' style; perhaps I only read too little of what is at present written in Germany to know this. But one thing I know all the surer: the German public decorations which also reach places abroad, are not inspired by German music, but just by that new tone of tasteless arrogance. Almost in every speech of the foremost German statesman, and even when he makes himself heard through his imperial mouth-piece, there is an accent which the ear of a foreigner repudiates with aversion: but the Germans endure it,--they endure themselves.

105.

_The Germans as Artists.--_When once a German actually experiences passion (and not only, as is usual, the mere inclination to it), he then behaves just as he must do in passion, and does not think further of his behaviour. The truth is, however, that he then behaves very awkwardly and uglily, and as if destitute of rhythm and melody; so that onlookers are pained or moved thereby, but nothing more--_unless_ he elevate himself to the sublimity and enrapturedness of which certain passions are capable. Then even the German becomes _beautiful._ The consciousness of the _height at which_ beauty begins to shed its charm even over Germans, forces German artists to the height and the super-height, and to the extravagances of passion: they have an actual, profound longing, therefore, to get beyond, or at least to look beyond the ugliness and awkwardness--into a better, easier, more southern, more sunny world. And thus their convulsions are often merely indications that they would like to _dance:_ these poor bears in whom hidden nymphs and satyrs, and sometimes still higher divinities, carry on their game!

106.

Music as Advocate.--"I have a longing for a master of the musical art," said an innovator to his disciple, "that he may learn from me my ideas and speak them more widely in his language: I shall thus be better able to reach men's ears and hearts. For by means of tones one can seduce men to every error and every truth: who could _refute_ a tone?"--"You would, therefore, like to be regarded as irrefutable?" said his disciple. The innovator answered: "I should like the germ to become a tree. In order that a doctrine may become a tree, it must be believed in for a considerable period; in order that it may be believed in it must be regarded as irrefutable. Storms and doubts and worms and wickedness are necessary to the tree, that it may manifest its species and the strength of its germ; let it perish if it is not strong enough! But a germ is always merely annihilated,--not refuted!"--When he had said this, his disciple called out impetuously: "But I believe in your cause, and regard it as so strong that I will say everything against it, everything that I still have in my heart."--The innovator laughed to himself and threatened the disciple with his finger. "This kind of discipleship," said he then, "is the best, but it is dangerous, and not every kind of doctrine can stand it."

107.

Our Ultimate Gratitude to Art.--If we had not approved of the Arts and invented this sort of cult of the untrue, the insight into the general untruth and falsity of things now given us by science--an insight into delusion and error as conditions of intelligent and sentient existence--would be quite unendurable. _Honesty_ would have disgust and suicide in its train. Now, however, our honesty has a counterpoise which helps us to escape such consequences;--namely, Art, as the _good-will_ to illusion. We do not always restrain our eyes from rounding off and perfecting in imagination: and then it is no longer the eternal imperfection that we carry over the river of Becoming--for we think we carry a _goddess,_ and are proud and artless in rendering this service. As an æsthetic phenomenon existence is still _endurable_ to us; and by Art, eye and hand and above all the good conscience are given to us, _to be able_ to make such a phenomenon out of ourselves. We must rest from ourselves occasionally by contemplating and looking down upon ourselves, and by laughing or weeping _over_ ourselves from an artistic remoteness: we must discover the _hero,_ and likewise the _fool,_ that is hidden in our passion for knowledge; we must now and then be joyful in our folly, that we may continue to be joyful in our wisdom! And just because we are heavy and serious men in our ultimate depth, and are rather weights than men,

there is nothing that does us so much good as the _fool's cap and bells:_ we need them in presence of ourselves--we need all arrogant, soaring, dancing, mocking, childish and blessed Art, in order not to lose the _free dominion over things_ which our ideal demands of us. It would be _backsliding_ for us, with our susceptible integrity, to lapse entirely into morality, and actually become virtuous monsters and scarecrows, on account of the over-strict requirements which we here lay down for ourselves. We ought also to _be able_ to stand _above_ morality, and not only stand with the painful stiffness of one who every moment fears to slip and fall, but we should also be able to soar and play above it! How could we dispense with Art for that purpose, how could we dispense with the fool?--And as long as you are still _ashamed_ of yourselves in any way, you still do not belong to us!

BOOK THIRD

108.

New Struggles.--After Buddha was dead people showed his shadow for centuries afterwards in a cave,--an immense frightful shadow. God is dead:--but as the human race is constituted, there will perhaps be caves for millenniums yet, in which people will show his shadow.--And we--we have still to overcome his shadow!

109.

Let us be on our Guard.--Let us be on our guard against thinking that the world is a living being. Where could it extend itself? What could it nourish itself with? How could it grow and increase? We know tolerably well what the organic is; and we are to reinterpret the emphatically derivative, tardy, rare and accidental, which we only perceive on the crust of the earth, into the essential, universal and eternal, as those do who call the universe an organism? That disgusts me. Let us now be on our guard against believing that the universe is a machine; it is assuredly not constructed with a view to _one_ end; we invest it with far too high an honour with the word "machine." Let us be on our guard against supposing that anything so methodical as the cyclic motions of our neighbouring stars obtains generally and throughout the universe; indeed a glance at the Milky Way induces doubt as to whether there are not many cruder and more contradictory motions there, and even stars with continuous, rectilinearly gravitating orbits, and the like. The astral arrangement in which we live is an exception; this arrangement, and the relatively long durability which is determined by it, has again made possible the exception of exceptions, the formation of organic life. The general character of the world, on the other hand, is to all eternity chaos; not by the absence of necessity, but in the sense of the absence of order, structure, form, beauty, wisdom, and whatever else our æsthetic humanities are called. Judged by our reason, the unlucky casts are far oftenest the rule, the exceptions are not the secret purpose; and the whole musical box repeats eternally its air, which can never be called a melody,--and finally the very expression, "unlucky cast" is already an anthropomorphising which involves blame. But how could we presume to blame or praise the universe! Let us be on our guard against ascribing to it heartlessness and unreason, or their opposites; it is neither perfect, nor beautiful, nor noble; nor does it seek to be anything of the kind, it does not at all attempt to imitate man! It is altogether unaffected by our æsthetic and moral judgments! Neither has it any self-preservative instinct, nor instinct at all; it also knows no law. Let us be on our guard against saying that there are laws in nature. There are only necessities: there is no one who commands, no one who obeys, no one who transgresses. When you know that there is no design, you know also that there is no chance: for it is only where there is a world of design that the word "chance" has a meaning. Let us be on our guard against saying that death is contrary to life. The living being is only a species of dead being, and a very rare species.--Let us be on our guard against thinking that the world eternally creates the new. There are no eternally enduring substances; matter is just another such error as the God of the Eleatics. But when shall we be at an end with our foresight and precaution! When will all these shadows of God cease to obscure us? When shall we have nature entirely undeified! When shall we be permitted to _naturalise_ ourselves by means of the pure, newly discovered, newly redeemed nature?

110.

Origin of Knowledge.--Throughout immense stretches of time the intellect produced nothing but errors; some of them proved to be useful and preservative of the species: he who fell in with them, or inherited them, waged the battle for himself and his offspring with better success. Those erroneous articles of faith which were successively transmitted by inheritance, and have finally become almost the property and stock of the human species, are, for example, the following:--that there are enduring things, that there are equal things, that there are things, substances, and bodies, that a thing is what it appears, that our will is free, that what is good for me is also good absolutely. It was only very late that the deniers and doubters of such propositions came forward,--it was only very late that truth made its appearance as the most impotent form of knowledge. It seemed as if it were impossible to get along with

truth, our organism was adapted for the very opposite; all its higher functions, the perceptions of the senses, and in general every kind of sensation, co-operated with those primevally embodied, fundamental errors. Moreover, those propositions became the very standards of knowledge according to which the "true" and the "false" were determined--throughout the whole domain of pure logic. The _strength_ of conceptions does not, therefore, depend on their degree of truth, but on their antiquity, their embodiment, their character as conditions of life. Where life and knowledge seemed to conflict, there has never been serious contention; denial and doubt have there been regarded as madness. The exceptional thinkers like the Eleatics, who, in spite of this, advanced and maintained the antitheses of the natural errors, believed that it was possible also _to live_ these counterparts: it was they who devised the sage as the man of immutability, impersonality and universality of intuition, as one and all at the same time, with a special faculty for that reverse kind of knowledge; they were of the belief that their knowledge was at the same time the principle of _life._ To be able to affirm all this, however, they had to _deceive_ themselves concerning their own condition: they had to attribute to themselves impersonality and unchanging permanence, they had to mistake the nature of the philosophic individual, deny the force of the impulses in cognition, and conceive of reason generally as an entirely free and self-originating activity; they kept their eyes shut to the fact that they also had reached their doctrines in contradiction to valid methods, or through their longing for repose or for exclusive possession or for domination. The subtler development of sincerity and of scepticism finally made these men impossible; their life also, and their judgments, turned out to be dependent on the primeval impulses and fundamental errors of all sentient being.--The subtler sincerity and scepticism arose wherever two antithetical maxims appeared to be _applicable_ to life, because both of them were compatible with the fundamental errors; where, therefore, there could be contention concerning a higher or lower degree of _utility_ for life; and likewise where new maxims proved to be, not necessarily useful, but at least not injurious, as expressions of an intellectual impulse to play a game that was like all games innocent and happy. The human brain was gradually filled with such judgments and convictions; and in this tangled skein there arose ferment, strife and lust for power. Not only utility and delight, but every kind of impulse took part in the struggle for "truths": the intellectual struggle became a business, an attraction, a calling, a duty, an honour--: cognizing and striving for the true finally arranged themselves as needs among other needs. From that moment, not only belief and conviction, but also examination, denial, distrust and contradiction became _forces;_ all "evil" instincts were subordinated to knowledge, were placed in its service, and acquired the prestige of the permitted, the honoured, the useful, and finally the appearance and innocence of the _good._ Knowledge, thus became a portion of life itself, and as life it became a continually growing power: until finally the cognitions and those primeval, fundamental errors clashed with each other, both as life, both as power, both in the same man. The thinker is now the being in whom the impulse to truth and those life-preserving errors wage their first conflict, now that the impulse to truth has also _proved_ itself to be a life-preserving power. In comparison with the importance of this conflict everything else is indifferent; the final question concerning the conditions of life is here raised, and the first attempt is here made to answer it by experiment. How far is truth susceptible of embodiment?--that is the question, that is the experiment.

111.

Origin of the Logical.--Where has logic originated in men's heads? Undoubtedly out of the illogical, the domain of which must originally _have_ been immense. But numberless beings who reasoned otherwise than we do at present, perished; albeit that they may have come nearer to truth than we! Whoever, for example, could not discern the "like" often enough with regard to food, and with regard to animals dangerous to him, whoever, therefore, deduced too slowly, or was too circumspect in his deductions, had smaller probability of survival than he who in all similar cases immediately divined the equality. The preponderating inclination, however, to deal with the similar as the equal--an illogical inclination, for there is nothing equal in itself--first created the whole basis of logic. It was just so (in order that the conception of substance should originate, this being indispensable to logic, although in the strictest sense nothing actual corresponds to it) that for a long period the changing process in things had to be overlooked, and remain unperceived; the beings not seeing correctly had an advantage over those who saw everything "in flux." In itself every high degree of circumspection in conclusions, every sceptical inclination, is a great danger to life. No living being might have been preserved unless the contrary inclination--to affirm rather than suspend judgment, to mistake and fabricate rather than wait, to assent rather than deny, to decide rather than be in the right--had been cultivated with extraordinary assiduity.--The course of logical thought and reasoning in our modern brain corresponds to a process and struggle of impulses, which singly and in themselves are all very illogical and unjust; we experience usually only the result of the struggle, so rapidly and secretly does this primitive mechanism now operate in us.

112.

Cause and Effect.--We say it is "explanation"; but it is only in "description" that we are in advance of the older stages of knowledge and science. We describe better,--we explain just as little as our predecessors. We have discovered a manifold succession where the naïve man and investigator of older cultures saw only two things, "cause" and "effect," as it was said; we have perfected the conception of becoming, but have not got a knowledge of what is above and behind the conception. The series of "causes" stands before us much more complete in every case; we conclude that this and that must first precede in order that that other may follow--but we have not _grasped_ anything thereby. The peculiarity, for example, in every chemical process seems a "miracle," the same as before, just like all locomotion; nobody has "explained" impulse. How could we ever explain! We operate only with things which do not exist, with lines, surfaces, bodies, atoms, divisible times, divisible spaces--how can explanation ever be possible when we first make everything a _conception,_ our conception! It is sufficient to regard science as the exactest humanising of things that is possible; we always learn to describe ourselves more accurately by describing things and their successions. Cause and effect: there is probably never any such duality; in fact there is a _continuum_ before us, from which we isolate a few portions;--just as we always observe a motion as isolated points, and therefore do not properly see it, but infer it. The abruptness with which many effects take place leads us into error; it is however only an abruptness for us. There is an infinite multitude of processes in that abrupt moment which escape us. An intellect which could see cause and effect as a _continuum,_ which could see the flux of events not according to our mode of perception, as things arbitrarily separated and broken--would throw aside the conception of cause and effect, and would deny all conditionality.

113.

The Theory of Poisons.--So many things have to be united in order that scientific thinking may arise, and all the necessary powers must have been devised, exercised, and fostered singly! In their isolation, however, they have very often had quite a different effect than at present, when they are confined within the limits of scientific thinking and kept mutually in check:--they have operated as poisons; for example, the doubting impulse, the denying impulse, the waiting impulse, the collecting impulse, the disintegrating impulse. Many hecatombs of men were sacrificed ere these impulses learned to understand their juxtaposition and regard themselves as functions of one organising force in one man! And how far are we still from the point at which the artistic powers and the practical wisdom of life shall co-operate with scientific thinking, so that a higher organic system may be formed, in relation to which the scholar, the physician, the artist, and the lawgiver, as we know them at present, will seem sorry antiquities!

114.

The Extent of the Moral.--We construct a new picture, which we see immediately with the aid of all the old experiences which we have had, _always according to the degree_ of our honesty and justice. The only experiences are moral experiences, even in the domain of sense-perception.

115.

The Four Errors.--Man has been reared by his errors: firstly, he saw himself always imperfect; secondly,-he attributed to himself--imaginary qualities; thirdly, he felt himself in a false position in relation to the animals and nature; fourthly, he always devised new tables of values, and accepted them for a time as eternal and unconditioned, so that at one time this, and at another time that human impulse or state stood first, and was ennobled in consequence. When one has deducted the effect of these four errors, one has also deducted humanity, humaneness, and "human dignity."

116.

Herd-Instinct.--Wherever we meet with a morality we find a valuation and order of rank of the human impulses and activities. These valuations and orders of rank are always the expression of the needs of a community or herd: that which is in the first place to _its_ advantage--and in the second place and third place--is also the authoritative standard for the worth of every individual. By morality the individual is taught to become a function of the herd, and to ascribe to himself value only as a function. As the conditions for the maintenance of one community have been very different from those of another community, there have been very different moralities; and in respect to the future essential transformations of herds and communities, states and societies, one can prophesy that there will still be very divergent moralities. Morality is the herd-instinct in the individual.

117.

The Herd's Sting of Conscience.--In the longest and remotest ages of the human race there was quite a different sting of conscience from that of the present day. At present one only feels responsible for what one intends and for what one does, and we have our pride in ourselves. All our professors of jurisprudence start with this sentiment of individual independence and pleasure, as if the source of right had taken its rise here from the beginning. But throughout the longest period in the life of mankind there was nothing more terrible to a person than to feel himself independent. To be alone, to feel independent, neither to obey nor to rule, to represent an individual--that was no pleasure to a person then, but a punishment; he was condemned "to be an individual." Freedom of thought was regarded as discomfort personified. While we feel law and regulation as constraint and loss, people formerly regarded egoism as a painful thing, and a veritable evil. For a person to be himself, to value himself according to his own measure and weight--that was then quite distasteful. The inclination to such a thing would have been regarded as madness; for all miseries and terrors were associated with being alone. At that time the "free will" had bad conscience in close proximity to it; and the less independently a person acted, the more the herd-instinct, and not his personal character, expressed itself in his conduct, so much the more moral did he esteem himself. All that did injury to the herd, whether the individual had intended it or not, then caused him a sting of conscience--and his neighbour likewise, indeed the whole herd!--It is in this respect that we have most changed our mode of thinking.

118.

_Benevolence--_Is it virtuous when a cell transforms itself into the function of a stronger cell? It must do so. And is it wicked when the stronger one assimilates the other? It must do so likewise: it is necessary, for it has to have abundant indemnity and seeks to regenerate itself. One has therefore to distinguish the instinct of appropriation and the instinct of submission in benevolence, according as the stronger or the weaker feels benevolent. Gladness and covetousness are united in the stronger person, who wants to transform something to his function: gladness and desire-to-be-coveted in the weaker person, who would like to become a function.--The former case is essentially pity, a pleasant excitation of the instinct of appropriation at the sight of the weak: it is to be remembered, however, that "strong" and "weak" are relative conceptions.

119.

No Altruism!/--I see in many men an excessive impulse and delight in wanting to be a function; they strive after it, and have the keenest scent for all those positions in which precisely _they_ themselves can be functions. Among such persons are those women who transform themselves into just that function of a man that is but weakly-developed in him, and then become his purse, or his politics, or his social intercourse. Such beings maintain themselves best when they insert themselves in an alien organism; if they do not succeed they become vexed, irritated, and eat themselves up.

120.

Health of the Soul.--The favourite medico-moral formula (whose originator was Ariston of Chios), "Virtue is the health of the soul," would, for all practical purposes, have to be altered to this: "Thy virtue is the health of thy soul." For there is no such thing as health in itself, and all attempts to define a thing in that way have lamentably failed. It is necessary to know thy aim, thy horizon, thy powers, thy impulses, thy errors, and especially the ideals and fantasies of thy soul, in order to determine _what health_ implies even for thy _body._ There are consequently innumerable kinds of physical health; and the more one again permits the unique and unparalleled to raise its head, the more one unlearns the dogma of the "Equality of men," so much the more also must the conception of a normal health, together with a normal diet and a normal course of disease, be abrogated by our physicians. And then only would it be time to turn our thoughts to the health and disease of the _soul,_ and make the special virtue of everyone consist in its health; but, to be sure, what appeared as health in one person might appear as the contrary of health in another. In the end the great question might still remain open:--Whether we could _do without_ sickness for the development of our virtue, and whether our thirst for knowledge and self-knowledge would not especially need the sickly soul as well as the sound one; in short, whether the mere will to health is not a prejudice, a cowardice, and perhaps an instance of the subtlest barbarism and unprogressiveness?

121.

Life no Argument.--We have arranged for ourselves a world in which we can live--by the postulating of bodies, lines, surfaces, causes and effects, motion and rest, form and content: without these articles of faith no one could manage to live at present! But for all that they are still unproved. Life is no argument; error might be among the conditions of life.

122.

The Element of Moral Scepticism in Christianity.--Christianity also has made a great contribution to enlightenment, and has taught moral scepticism --in a very impressive and effective manner, accusing and embittering, but with untiring patience and subtlety; it annihilated in every individual the belief in his virtues: it made the great virtuous ones, of whom antiquity had no lack, vanish for ever from the earth, those popular men, who, in the belief in their perfection, walked about with the dignity of a hero of the bull-fight. When, trained in this Christian school of scepticism, we now read the moral books of the ancients, for example those of Seneca and Epictetus, we feel a pleasurable superiority, and are full of secret insight and penetration,--it seems to us as if a child talked before an old man, or a pretty, gushing girl before La Rochefoucauld:--we know better what virtue is! After all, however, we have applied the same scepticism to all _religious_ states and processes, such as sin, repentance, grace, sanctification, &c., and have allowed the worm to burrow so well, that we have now the same feeling of subtle superiority and insight even in reading all Christian books:--we know also the religious feelings better! And it is time to know them well and describe them well, for the pious ones of the old belief die out also; let us save their likeness and type, at least for the sake of knowledge.

123.

Knowledge more than a Means.--Also _without_ this passion--I refer to the passion for knowledge--science would be furthered: science has hitherto increased and grown up without it. The good faith in science, the prejudice in its favour, by which States are at present dominated (it was even the Church formerly), rests fundamentally on the fact that the absolute inclination and impulse has so rarely revealed itself in it, and that science is regarded _not_ as a passion, but as a condition and an "ethos." Indeed, _amour-plaisir_ of knowledge (curiosity) often enough suffices, _amour-vanité_ suffices, and habituation to it, with the afterthought of obtaining honour and bread; it even suffices for many that they do not know what to do with a surplus of leisure, except to continue reading, collecting, arranging, observing and narrating; their "scientific impulse" is their ennui. Pope Leo X once (in the brief to Beroaldus) sang the praise of science; he designated it as the finest ornament and the greatest pride of our life, a noble employment in happiness and in misfortune; "without it," he says finally, "all human undertakings would be without a firm basis,--even with it they are still sufficiently mutable and insecure!" But this rather sceptical Pope, like all other ecclesiastical panegyrists of science, suppressed his ultimate judgment concerning it. If one may deduce from his words what is remarkable enough for such a lover of art, that he places science above art it is alter all, however, only from politeness that he omits to speak of that which he places high above all science: the "revealed truth," and the "eternal salvation o the soul,"--what are ornament, pride, entertainment and security of life to him, in comparison thereto? "Science is something of secondary rank, nothing ultimate or unconditioned, no object of passion"--this judgment was kept back in Leos soul: the truly Christian judgment concerning science! In antiquity its dignity and appreciation were lessened by the fact that, even among its most eager disciples, the striving after _virtue_ stood foremost and that people thought they had given the highest praise to knowledge when they celebrated it as the best means to virtue. It is something new in history that knowledge claims to be more than a means.

124.

In the Horizon of the Infinite.--We have left the land and have gone aboard ship! We have broken down the bridge behind us,--nay, more, the land behind us! Well, little ship! look out! Beside thee is the ocean; it is true it does not always roar, and sometimes it spreads out like silk and gold and a gentle reverie. But times will come when thou wilt feel that it is infinite, and that there is nothing more frightful than infinity. Oh, the poor bird that felt itself free, and now strikes against the walls of this cage! Alas, if home-sickness for the land should attack thee, as if there had been more _freedom_ there,--and there is no "land" any longer!

125.

The Madman.--Have you ever heard of the madman who on a bright morning lighted a lantern and ran to the market-place calling out unceasingly: "I seek God! I seek God!"--As there were many people standing about who did not believe in God, he caused a great deal of amusement. Why! is he lost? said one. Has he strayed away like a child? said another. Or does he keep himself hidden? Is he afraid of us? Has he taken a sea-voyage? Has he emigrated?--the people cried out laughingly, all in a hubbub. The insane man jumped into their midst and transfixed them with his glances. "Where is God gone?" he called out. "I mean to tell you! _We have killed him,_--you and I! We are all his murderers! But how have we done it? How were we able to drink up the sea? Who gave us the sponge to wipe away the whole horizon? What did we do when we loosened this earth from its sun? Whither does it now move? Whither do we move? Away from all suns? Do we not dash on unceasingly? Back-wards, sideways, forewards,

in all directions? Is there still an above and below? Do we not stray, as through infinite nothingness? Does not empty space breathe upon us? Has it not become colder? Does not night come on continually, darker and darker? Shall we not have to light lanterns in the morning? Do we not hear the noise of the grave-diggers who are burying God? Do we not smell the divine putrefaction?--for even Gods putrefy! God is dead! God remains dead! And we have killed him! How shall we console ourselves, the most murderous of all murderers? The holiest and the mightiest that the world has hitherto possessed, has bled to death under our knife,--who will wipe the blood from us? With what water could we cleanse ourselves? What lustrums, what sacred games shall we have to devise? Is not the magnitude of this deed too great for us? Shall we not ourselves have to become Gods, merely to seem worthy of it? There never was a greater event,--and on account of it, all who are born after us belong to a higher history than any history hitherto!"--Here the madman was silent and looked again at his hearers; they also were silent and looked at him in surprise. At last he threw his lantern on the ground, so that it broke in pieces and was extinguished. "I come too early," he then said, "I am not yet at the right time. This prodigious event is still on its way, and is travelling,--it has not yet reached men's ears. Lightning and thunder need time, the light of the stars needs time, deeds need time, even after they are done, to be seen and heard. This deed is as yet further from them than the furthest star,--_and yet they have done it!"--It_ is further stated that the madman made his way into different churches on the same day, and there intoned his _Requiem æternam deo._ When led out and called to account, he always gave the reply: "What are these churches now, if they are not the tombs and monuments of God?"--

126.

Mystical Explanations.--Mystical explanations are regarded as profound; the truth is that they do not even go the length of being superficial.

127.

_After-Effect of the most Ancient Religiousness.--_The thoughtless man thinks that the Will is the only thing that operates, that willing is something simple, manifestly given, underived, and comprehensible in itself. He is convinced that when he does anything, for example, when he delivers a blow, it is _he_ who strikes, and he has struck because he _willed_ to strike. He does not notice anything of a problem therein, but the feeling of _willing_ suffices to him, not only for the acceptance of cause and effect, but also for the belief that he _understands_ their relationship. Of the mechanism of the occurrence, and of the manifold subtle operations that must be performed in order that the blow may result, and likewise of the incapacity of the Will in itself to effect even the smallest part of those operations--he knows nothing. The Will is to him a magically operating force; the belief in the Will as the cause of effects is the belief in magically operating forces. In fact, whenever he saw anything happen, man originally believed in a Will as cause, and in personally _willing_ beings operating in the background,--the conception of mechanism was very remote from him. Because, however, man for immense periods of time believed only in persons (and not in matter, forces, things, &c.), the belief in cause and effect has become a fundamental belief with him, which he applies everywhere when anything happens,--and even still uses instinctively as a piece of atavism of remotest origin. The propositions, "No effect without a cause," and "Every effect again implies a cause," appear as generalisations of several less general propositions:--"Where there is operation there has been _willing_." "Operating is only possible on _willing_ beings." "There is never a pure, resultless experience of activity, but every experience involves stimulation of the Will" (to activity, defence, revenge or retaliation). But in the primitive period of the human race, the latter and the former propositions were identical, the first were not generalisations of the second, but the second were explanations of the first.--Schopenhauer, with his assumption that all that exists is something _volitional,_ has set a primitive mythology on the throne; he seems never to have attempted an analysis of the Will, because he _believed_ like everybody in the simplicity and immediateness of all volition:--while volition is in fact such a cleverly practised mechanical process that it almost escapes the observing eye. I set the following propositions against those of Schopenhauer:--Firstly, in order that Will may arise, an idea of pleasure and pain is necessary. Secondly, that a vigorous excitation may be felt as pleasure or pain, is the affair of the _interpreting_ intellect, which, to be sure, operates thereby for the most part unconsciously to us, and one and the same excitation _may_ be interpreted as pleasure or pain. Thirdly, it is only in an intellectual being that there is pleasure, displeasure and Will; the immense majority of organisms have nothing of the kind.

128.

_The Value of Prayer.--_Prayer has been devised for such men as have never any thoughts of their own, and to whom an elevation of the soul is unknown, or passes unnoticed; what shall these people do in holy places and in all important situations in life which require repose and some kind of dignity? In order at least that they may not _disturb,_ the wisdom of all the founders of religions,

the small as well as the great, has commended to them the formula of prayer, as a long mechanical labour of the lips, united with an effort of the memory, and with a uniform, prescribed attitude of hands and feet--_and_ eyes! They may then, like the Tibetans, chew the cud of their "_om mane padme hum,"_ innumerable times, or, as in Benares, count the name of the God Ram-Ram-Ram (etc., with or without grace) on their fingers; or honour Vishnu with his thousand names of invocation, Allah with his ninety-nine; or they may make use of the prayer-wheels and the rosary: the main thing is that they are settled down for a time at this work, and present a tolerable appearance; their mode of prayer is devised for the advantage of the pious who have thought and elevation of their own. But even these have their weary hours when a series of venerable words and sounds, and a mechanical, pious ritual does them good. But supposing that these rare men--in every religion the religious man is an exception--know how to help themselves, the poor in spirit do not know, and to forbid them the prayer-babbling would mean to take their religion from them, a fact which Protestantism brings more and more to light. All that religion wants with such persons is that they should _keep still_ with their eyes, hands, legs, and all their organs: they thereby become temporarily beautified and--more human-looking!

129.

The Conditions for God.--"God himself cannot subsist without wise men," said Luther, and with good reason; but "God can still less subsist without unwise men,"--good Luther did not say that!

130.

_A Dangerous Resolution.--_The Christian resolution to find the world ugly and bad, has made the world ugly and bad.

131.

Christianity and Suicide.--Christianity made use of the excessive longing for suicide at the time of its origin as a lever for its power: it left only two forms of suicide, invested them with the highest dignity and the highest hopes, and forbade all others with dreadful threatenings. But martyrdom and the slow self-annihilation of the ascetic were permitted.

132.

Against Christianity.--It is now no longer our reason, but our taste that decides against Christianity.

133.

Axioms.--An unavoidable hypothesis on which mankind must always fall back again, is in the long run _more powerful_ than the most firmly believed belief in something untrue (like the Christian belief). In the long run: that means a hundred thousand years hence.

134.

Pessimists as Victims.--When a profound dislike of existence gets the upper hand, the after-effect of a great error in diet of which a people has been long guilty comes to light. The spread of Buddhism (_not_ its origin) is thus to a considerable extent dependent on the excessive and almost exclusive rice-fare of the Indians, and on the universal enervation that results therefrom. Perhaps the modern, European discontentedness is to be looked upon as caused by the fact that the world of our forefathers, the whole Middle Ages, was given to drink, owing to the influence of German tastes in Europe: the Middle Ages, that means the alcoholic poisoning of Europe.--The German dislike of life (including the influence of the cellar-air and stove-poison in German dwellings), is essentially a cold-weather complaint.

135.

Origin of Sin--Sin, as it is at present felt wherever Christianity prevails or has prevailed is a Jewish feeling and a Jewish invention; and in respect to this background of all Christian morality Christianity has in fact aimed at "Judaising" the whole world. To what an extent this has succeeded in Europe is traced most accurately in our remarkable alienness to Greek antiquity--a world without the feeling of sin--in our sentiments even at present; in spite of all the good will to approximation and assimilation, which whole generations and many distinguished individuals have not failed to display. "Only when thou _repentest_ is God gracious to thee"--that would arouse the laughter or the wrath of a Greek: he would say, "Slaves may have such sentiments." Here a mighty being, an almighty being, and yet a revengeful being, is presupposed; his power is so great that no injury whatever can be done to

him except in the point of honour. Every sin is an infringement of respect, a _crimen læsæ majestatis divinæ_?--and nothing more! Contrition, degradation, rolling-in-the-dust,--these are the first and last conditions on which his favour depends: the restoration, therefore, of his divine honour! If injury be caused otherwise by sin, if a profound, spreading evil be propagated by it, an evil which, like a disease, attacks and strangles one man after another--that does not trouble this honour-craving Oriental in heaven; sin is an offence against him, not against mankind!--to him on whom he has bestowed his favour he bestows also this indifference to the natural consequences of sin. God and mankind are here thought of as separated as so antithetical that sin against the latter cannot be at all possible,--all deeds are to be looked upon _solely with respect to their supernatural consequences,_ and not with respect to their natural results: it is thus that the Jewish feeling, to which all that is natural seems unworthy in itself, would have things. The _Greeks,_ on the other hand, were more familiar with the thought that transgression also may have dignity,--even theft, as in the case of Prometheus, even the slaughtering of cattle as the expression of frantic jealousy, as in the case of Ajax; in their need to attribute dignity to transgression and embody it therein, they invented _tragedy,_--an art and a delight, which in its profoundest essence has remained alien to the Jew, in spite of all his poetic endowment and taste for the sublime.

136.

The Chosen People.--The Jews, who regard themselves as the chosen people among the nations, and that too because they are the moral genius among the nations (in virtue of their capacity for _despising_ the human in themselves _more_ than any other people)--the Jews have a pleasure in their divine monarch and saint similar to that which the French nobility had in Louis XIV. This nobility had allowed its power and autocracy to be taken from it, and had become contemptible: in order not to feel this, in order to be able to forget it, an _unequalled_ royal magnificence, royal authority and plenitude of power was needed, to which there was access only for the nobility. As in accordance with this privilege they raised themselves to the elevation of the court, and from that elevation saw everything under them,--saw everything contemptible,--they got beyond all uneasiness of conscience. They thus elevated intentionally the tower of the royal power more and more into the clouds, and set the final coping-stone of their own power thereon.

137.

Spoken in Parable.--A Jesus Christ was only possible in a Jewish landscape--I mean in one over which the gloomy and sublime thunder-cloud of the angry Jehovah hung continually. Here only was the rare, sudden flashing of a single sunbeam through the dreadful, universal and continuous nocturnal-day regarded as a miracle of "love," as a beam of the most unmerited "grace." Here only could Christ dream of his rainbow and celestial ladder on which God descended to man; everywhere else the clear weather and the sun were considered the rule and the commonplace.

138.

_The Error of Christ.--_The founder of Christianity thought there was nothing from which men suffered so much as from their sins:--it was his error, the error of him who felt himself without sin, to whom experience was lacking in this respect! It was thus that his soul filled with that marvellous, fantastic pity which had reference to a trouble that even among his own people, the inventors of sin, was rarely a great trouble! But Christians understood subsequently how to do justice to their master, and how to sanctify his error into a "truth."

139.

_Colour of the Passions.--_Natures such as the apostle Paul, have an evil eye for the passions; they learn to know only the filthy, the distorting, and the heart-breaking in them,--their ideal aim, therefore, is the annihilation of the passions; in the divine they see complete purification from passion. The Greeks, quite otherwise than Paul and the Jews, directed their ideal aim precisely to the passions, and loved, elevated, embellished and deified them: in passion they evidently not only felt themselves happier, but also purer and diviner than otherwise.--And now the Christians? Have they wished to become Jews in this respect? Have they perhaps become Jews?

140.

_Too Jewish.--_If God had wanted to become an object of love, he would first of all have had to forgo judging and justice:-a judge, and even a gracious judge, is no object of love. The founder of Christianity showed too little of the finer feelings in this respect--being a Jew.

141.

Too Oriental.--What? A God who loves men provided that they believe in him, and who hurls frightful glances and threatenings at him who does not believe in this love! What? A conditioned love as the feeling of an almighty God! A love which has not even become master of the sentiment of honour and of the irritable desire for vengeance! How Oriental is all that! "If I love thee, what does it concern thee?"[1] is already a sufficient criticism of the whole of Christianity.

142.

Frankincense.--Buddha says: "Do not flatter thy benefactor!" Let one repeat this saying in a Christian church:--it immediately purifies the air.

143.

The Greatest Utility of Polytheism.--For the individual to set up his _own_ ideal and derive from it his laws, his pleasures and his rights--_that_ has perhaps been hitherto regarded as the most monstrous of all human aberrations, and as idolatry in itself; in fact, the few who have ventured to do this have always needed to apologise to themselves, usually in this wise: "Not I! not I! but _a God,_ through my instrumentality!" It was in the marvellous art and capacity for creating Gods--in polytheism--that this impulse was permitted to discharge itself, it was here that it became purified, perfected, and ennobled; for it was originally a commonplace and unimportant impulse, akin to stubbornness, disobedience and envy. To be _hostile_ to this impulse towards the individual ideal,--that was formerly the law of every morality. There was then only one norm, "the man"--and every people believed that it _had_ this one and ultimate norm. But above himself, and outside of himself, in a distant over-world, a person could see a _multitude of norms:_ the one God was not the denial or blasphemy of the other Gods! It was here that individuals were first permitted, it was here that the right of individuals was first respected. The inventing of Gods, heroes, and supermen of all kinds, as well as co-ordinate men and undermen--dwarfs, fairies, centaurs, satyrs, demons, devils--was the inestimable preliminary to the justification of the selfishness and sovereignty of the individual: the freedom which was granted to one God in respect to other Gods, was at last given to the individual himself in respect to laws, customs and neighbours. Monotheism, on the contrary, the rigid consequence of the doctrine of one normal human being--consequently the belief in a normal God, beside whom there are only false, spurious Gods--has perhaps been the greatest danger of mankind in the past: man was then threatened by that premature state of inertia, which, so far as we can see, most of the other species of animals reached long ago, as creatures who all believed in one normal animal and ideal in their species, and definitely translated their morality of custom into flesh and blood. In polytheism man's free-thinking and many-sided thinking had a prototype set up: the power to create for himself new and individual eyes, always newer and more individualised: so that these are no _eternal_ horizons and perspectives.

[1] This means that true love does not look for reciprocity.

144.

Religious Wars.--The greatest advance of the masses hitherto has been religious war, for it proves that the masses have begun to deal reverently with conceptions of things. Religious wars only result when human reason generally has been refined by the subtle disputes of sects; so that even the populace becomes punctilious and regards trifles as important, actually thinking it possible that the "eternal salvation of the soul" may depend upon minute distinctions of concepts.

145.

Danger of Vegetarians.--The immense prevalence of rice-eating impels to the use of opium and narcotics, in like manner as the immense prevalence of potato-eating impels to the use of brandy:--it also impels, however, in its more subtle after-effects to modes of thought and feeling which operate narcotically. This is in accord with the fact that those who promote narcotic modes of thought and feeling, like those Indian teachers, praise a purely vegetable diet, and would like to make it a law for the masses: they want thereby to call forth and augment the need which _they_ are in a position to satisfy.

146.

_German Hopes.--_Do not let us forget that the names of peoples are generally names of reproach. The Tartars, for example, according to their name, are "the dogs"; they were so christened by the Chinese. _"Deutschen"_ (Germans) means originally

"heathen": it is thus that the Goths after their conversion named the great mass of their unbaptized fellow-tribes, according to the indication in their translation of the Septuagint, in which the heathen are designated by the word which in Greek signifies "the nations." (See Ulfilas.)--It might still be possible for the Germans to make an honourable name ultimately out of their old name of reproach, by becoming the first _non-Christian_ nation of Europe; for which purpose Schopenhauer, to their honour, regarded them as highly qualified. The work of _Luther_ would thus be consummated,--he who taught them to be anti-Roman, and to say: "Here _I_ stand! _I_ cannot do otherwise!"--

147.

Question and Answer.--What do savage tribes at present accept first of all from Europeans? Brandy and Christianity, the European narcotics.--And by what means are they fastest ruined?--By the European narcotics.

148.

Where Reformations Originate.--At the time of the great corruption of the church it was least of all corrupt in Germany: it was on that account that the Reformation originated _here,_ as a sign that even the beginnings of corruption were felt to be unendurable. For, comparatively speaking, no people was ever more Christian than the Germans at the time of Luther; their Christian culture was just about to burst into bloom with a hundred-fold splendour,--one night only was still lacking; but that night brought the storm which put an end to all.

149.

The Failure of Reformations.--It testifies to the higher culture of the Greeks, even in rather early ages, that attempts to establish new Grecian religions frequently failed; it testifies that quite early there must have been a multitude of dissimilar individuals in Greece, whose dissimilar troubles were not cured by a single recipe of faith and hope. Pythagoras and Plato, perhaps also Empedocles, and already much earlier the Orphic enthusiasts, aimed at founding new religions; and the two first-named were so endowed with the qualifications for founding religions, that one cannot be sufficiently astonished at their failure: they just reached the point of founding sects. Every time that the Reformation of an entire people fails and only sects raise their heads, one may conclude that the people already contains many types, and has begun to free itself from the gross herding instincts and the morality of, custom,--a momentous state of suspense, which one is accustomed to disparage as decay of morals and corruption, while it announces the maturing of the egg and the early rupture of the shell. That Luther's Reformation succeeded in the north, is a sign that the north had remained backward in comparison with the south of Europe, and still had requirements tolerably uniform in colour and kind; and there would have been no Christianising of Europe at all, if the culture of the old world of the south had not been gradually barbarized by an excessive admixture of the blood of German barbarians, and thus lost its ascendency. The more universally and unconditionally an individual, or the thought of an individual, can operate, so much more homogeneous and so much lower must be the mass that is there operated upon; while counter-strivings betray internal counter-requirements, which also want to gratify and realise themselves. Reversely, one may always conclude with regard to an actual elevation of culture, when powerful and ambitious natures only produce a limited and sectarian effect: this is true also for the separate arts, and for the provinces of knowledge. Where there is ruling there are masses: where there are masses there is need of slavery. Where there is slavery the individuals are but few, and have the instincts and conscience of the herd opposed to them.

150.

Criticism of Saints.--Must one then, in order to have a virtue, be desirous of having it precisely in its most brutal form?--as the Christian saints desired and needed;--those who only _endured_ life with the thought that at the sight of their virtue self-contempt might seize every man. A virtue with such an effect I call brutal.

151.

The Origin of Religion.--The metaphysical requirement is not the origin of religions, as Schopenhauer claims, but only a _later sprout_ from them. Under the dominance of religious thoughts we have accustomed ourselves to the idea of "another (back, under, or upper) world," and feel an uncomfortable void and privation through the annihilation of the religious illusion;--and then "another world" grows out of this feeling once more, but now it is only a metaphysical world, and no longer a religious one. That however which in general led to the assumption of "another world" in primitive times, was _not_ an impulse or requirement, but an _error_ in the interpretation of certain natural phenomena, a difficulty of the intellect.

152.

The greatest Change.--The lustre and the hues of all things have changed! We no longer quite understand how earlier men conceived of the most familiar and frequent things,--for example, of the day, and the awakening in the morning: owing to their belief in dreams the waking state seemed to them differently illuminated. And similarly of the whole of life, with its reflection of death and its significance: our "death" is an entirely different death. All events were of a different lustre, for a God shone forth in them; and similarly of all resolutions and peeps into the distant future: for people had oracles, and secret hints, and believed in prognostication. "Truth" was conceived in quite a different manner, for the insane could formerly be regarded as its mouthpiece--a thing which makes _us_ shudder, or laugh. Injustice made a different impression on the feelings: for people were afraid of divine retribution, and not only of legal punishment and disgrace. What joy was there in an age when men believed in the devil and tempter! What passion was there when people saw demons lurking close at hand! What philosophy was there when doubt was regarded as sinfulness of the most dangerous kind, and in fact as an outrage on eternal love, as distrust of everything good, high, pure, and compassionate!--We have coloured things anew, we paint them over continually,--but what have we been able to do hitherto in comparison with the _splendid colouring_ of that old master!--I mean ancient humanity.

153.

Homo poeta.--"I myself who have made this tragedy of tragedies altogether independently, in so far as it is completed; I who have first entwined the perplexities of morality about existence, and have tightened them so that only a God could unravel them--so Horace demands!--I have already in the fourth act killed all the Gods--for the sake of morality! What is now to be done about the fifth act? Where shall I get the tragic _dénouement!_ Must I now think about a comic _dénouement_?"

154.

Differences in the Dangerousness of Life.--You don't know at all what you experience; you run through life as if intoxicated, and now and then fall down a stair. Thanks however to your intoxication you still do not break your limbs: your muscles are too languid and your head too confused to find the stones of the staircase as hard as we others do! For, us life is a greater danger: we are made of glass--alas, if we should _strike against_ anything! And all is lost if we should _fall_!

155.

What we Lack.--We love the _grandeur_ of Nature, and have discovered it; that is because human grandeur is lacking in our minds. It was the reverse with the Greeks: their feeling towards Nature was quite different from ours.

156.

The most Influential Person.--The fact that a person resists the whole spirit of his age, stops it at the door and calls it to account, _must_ exert an influence! It is indifferent whether he wishes to exert an influence; the point is that he _can_.

157.

Mentiri.--Take care!--he reflects: he will have a lie ready immediately. This is a stage in the civilisation of whole nations. Consider only what the Romans expressed by _mentiri!_

158.

An Inconvenient Peculiarity.--To find everything deep is an inconvenient peculiarity: it makes one constantly strain one's eyes, so that in the end one always finds more than one wishes.

159.

Every Virtue has its Time.--The honesty of him who is at present inflexible often causes him remorse; for inflexibility is the virtue of a time different from that in which honesty prevails.

160.

In Intercourse with Virtues.--One can also be undignified and flattering towards a virtue.

161.

To the Admirers of the Age.--The runaway priest and the liberated criminal are continually making grimaces; what they want is a look without a past. But have you ever seen men who know that their looks reflect the future, and who are so courteous to you, the admirers of the "age," that they assume a look without a future?--

162.

Egoism.--Egoism is the _perspective_ law of our sentiment, according to which the near appears large and momentous, while in the distance the magnitude and importance of all things diminish.

163.

After a Great Victory.--The best thing in a great victory is that it deprives the conqueror of the fear of defeat. "Why should I not be worsted for once?" he says to himself, "I am now rich enough to stand it."

164.

Those who Seek Repose.--I recognise the minds that seek repose by the many _dark_ objects with which they surround themselves: those who want to sleep darken their chambers, or creep into caverns. A hint to those who do not know what they really seek most, and would like to know!

165.

The Happiness of Renunciation.--He who has absolutely dispensed with something for a long time will almost imagine, when he accidentally meets with it again, that he has discovered it,--and what happiness every discoverer has! Let us be wiser than the serpents that lie too long in the same sunshine.

166.

Always in our own Society.--All that is akin to me in nature and history speaks to me, praises me, urges me forward and comforts me--: other things are unheard by me, or immediately forgotten. We are only in our own society always.

167.

Misanthropy and Philanthropy.--We only speak about being sick of men when we can no longer digest them, and yet have the stomach full of them. Misanthropy is the result of a far too eager philanthropy and "cannibalism,"--but who ever bade you swallow men like oysters, my Prince Hamlet?

168.

Concerning an Invalid.--"Things go badly with him!"--What is wrong?--" He suffers from the longing to be praised, and finds no sustenance for it."--Inconceivable! All the world does honour to him, and he is reverenced not only in deed but in word!--"Certainly, but he is dull of hearing for the praise. When a friend praises him it sounds to him as if the friend praised himself; when an enemy praises him, it sounds to him as if the enemy wanted to be praised for it; when, finally, some one else praises him--there are by no means so many of these, he is so famous!--he is offended because they neither want him for a friend nor for an enemy; he is accustomed to say: 'What do I care for those who can still pose as the all-righteous towards me!'"

169.

Avowed Enemies.--Bravery in presence of an enemy is a thing by itself: a person may possess it and still be a coward and an irresolute num-skull. That was Napoleon's opinion concerning the "bravest man" he knew, Murat:--whence it follows that avowed enemies are indispensable to some men, if they are to attain to _their_ virtue, to their manliness, to their cheerfulness.

170.

With, the Multitude.--He has hitherto gone with the multitude and is its panegyrist; but one day he will be its opponent! For he follows it in the belief that his laziness will find its advantage thereby: he has not yet learned that the multitude is not lazy enough for him! that it always presses forward! that it does not allow any one to stand still!--And he likes so well to stand still!

171.

Fame.--When the gratitude of many to one casts aside all shame, then fame originates.

172.

The Perverter of Taste.--A: "You are a perverter of taste--they say so everywhere!" B: "Certainly! I pervert every one's taste for his party:--no party forgives me for that."

173.

To be Profound and to Appear Profound.--He who knows that he is profound strives for clearness; he who would like to appear profound to the multitude strives for obscurity. The multitude thinks everything profound of which it cannot see the bottom; it is so timid and goes so unwillingly into the water.

174.

Apart.--Parliamentarism, that is to say, the public permission to choose between five main political opinions, insinuates itself into the favour of the numerous class who would fain _appear_ independent and individual, and like to fight for their opinions. After all, however, it is a matter of indifference whether one opinion is imposed upon the herd, or five opinions are permitted to it.--He who diverges from the five public opinions and goes apart, has always the whole herd against him.

175.

Concerning Eloquence.--What has hitherto had the most convincing eloquence? The rolling of the drum: and as long as kings have this at their command, they will always be the best orators and popular leaders.

176.

Compassion.--The poor, ruling princes! All their rights now change unexpectedly into claims, and all these claims immediately sound like pretensions! And if they but say "we," or "my people," wicked old Europe begins laughing. Verily, a chief-master-of-ceremonies of the modern world would make little ceremony with them; perhaps he would decree that "_les souverains rangent aux parvenus._"

177.

On "Educational Matters."--In Germany an important educational means is lacking for higher men; namely, the laughter of higher men; these men do not laugh in Germany.

178.

For Moral Enlightenment.--The Germans must be talked out of their Mephistopheles--and out of their Faust also. These are two moral prejudices against the value of knowledge.

179.

_Thoughts.--_Thoughts are the shadows of our sentiments--always however obscurer, emptier and simpler.

180.

The Good Time for Free Spirits.--Free Spirits take liberties even with regard to Science--and meanwhile they are allowed to do so,--while the Church still remains!--In so far they have now their good time.

181.

Following and Leading.--A: "Of the two, the one will always follow, the other will always lead, whatever be the course of their destiny. _And yet_ the former is superior to the other in virtue and intellect." B: "And yet? And yet? That is spoken for the others; not for me, not for us!--_Fit secundum regulam._"

182.

In Solitude.--When one lives alone one does not speak too loudly, and one does not write too loudly either, for one fears the hollow reverberation--the criticism of the nymph Echo.--And all voices sound differently in solitude!

183.

The Music of the Best Future.--The first musician for me would be he who knew only the sorrow of the profoundest happiness, and no other sorrow: there has not hitherto been such a musician.

184.

Justice.--Better allow oneself to be robbed than have scarecrows around one--that is my taste. And under all circumstances it is just a matter of taste--and nothing more!

185.

Poor.--He is now poor, but not because everything has been taken from him, but because he has thrown everything away:--what does he care? He is accustomed to find new things.--It is the poor who misunderstand his voluntary poverty.

186.

Bad Conscience.--All that he now does is excellent and proper--and yet he has a bad conscience with it all. For the exceptional is his task.

187.

Offensiveness in Expression.--This artist offends me by the way in which he expresses his ideas, his very excellent ideas: so diffusely and forcibly, and with such gross rhetorical artifices, as if he were speaking to the mob. We feel always as if "in bad company" when devoting some time to his art.

188.

Work.--How closely work and the workers now stand even to the most leisurely of us! The royal courtesy in the words: "We are all workers," would have been a cynicism and an indecency even under Louis XIV.

189.

The Thinker.--He is a thinker: that is to say, he knows how to take things more simply than they are.

190.

Against Eulogisers.--A: "One is only praised by one's equals!" B: "Yes! And he who praises you says: 'You are my equal!'"

191.

Against many a Vindication.--The most perfidious manner of injuring a cause is to vindicate it intentionally with fallacious arguments.

192.

The Good-natured.--What is it that distinguishes the good-natured, whose countenances beam kindness, from other people? They feel quite at ease in presence of a new person, and are quickly enamoured of him; they therefore wish him well; their first opinion is: "He pleases me." With them there follow in succession the wish to appropriate (they make little scruple about the person's worth), rapid appropriation, joy in the possession, and actions in favour of the person possessed.

193.

Kant's Joke.--Kant tried to prove, in a way that dismayed "everybody," that "everybody" was in the right:--that was his secret joke. He wrote against the learned, in favour of popular prejudice; he wrote, however, for the learned and not for the people.

194.

The "Open-hearted" Man.--That man acts probably always from concealed motives; for he has always communicable motives on his tongue, and almost in his open hand.

195.

Laughable!--See! See! He runs _away_ from men--: they follow him, however, because he runs _before_ them,--they are such a gregarious lot!

196.

The Limits of our Sense of Hearing.--We hear only the questions to which we are capable of finding an answer.

197.

Caution therefore!--There is nothing we are fonder of communicating to others than the seal of secrecy--together with what is under it.

198.

Vexation of the Proud Man.--The proud man is vexed even with those who help him forward: he looks angrily at his carriage-horses.

199.

Liberality.--Liberality is often only a form of timidity in the rich.

200.

Laughing.--To laugh means to love mischief, but with a good conscience.

201.

In Applause.--In applause there is always some kind of noise: even in self-applause.

202.

A Spendthrift.--He has not yet the poverty of the rich man who has counted all his treasure,--he squanders his spirit with the irrationalness of the spendthrift Nature.

203.

Hic niger est.--Usually he has no thoughts,--but in exceptional cases bad thoughts come to him.

204.

Beggars and Courtesy.--"One is not discourteous when one knocks at a door with a stone when the bell-pull is awanting"--so think all beggars and necessitous persons, but no one thinks they are in the right.

205.

Need.--Need is supposed to be the cause of things; but in truth it is often only the result of things.

206.

During the Rain.--It rains, and I think of the poor people who now crowd together with their many cares, which they are unaccustomed to conceal; all of them, therefore, ready and anxious to give pain to one another, and thus provide themselves with a pitiable kind of comfort, even in bad weather. This, this only, is the poverty of the poor!

207.

The Envious Man.--That is an envious man--it is not desirable that he should have children; he would be envious of them, because he can no longer be a child.

208.

A Great Man!--Because a person is "a great man," we are not authorised to infer that he is a man. Perhaps he is only a boy, or a chameleon of all ages, or a bewitched girl.

209.

A Mode of Asking for Reasons.--There is a mode of asking for our reasons which not only makes us forget our best reasons, but also arouses in us a spite and repugnance against reason generally:-a very stupefying mode of questioning, and really an artifice of tyrannical men!

210.

Moderation in Diligence.--One must not be anxious to surpass the diligence of one's father--that would make one ill.

211.

Secret Enemies.--To be able to keep a secret enemy--that is a luxury which the morality even of the highest-minded persons can rarely afford.

212.

Not Letting oneself be Deluded.--His spirit has bad manners, it is hasty and always stutters with impatience; so that one would hardly suspect the deep breathing and the large chest of the soul in which it resides.

213.

The Way to Happiness.--A sage asked of a fool the way to happiness. The fool answered without delay, like one who had been asked the way to the next town: "Admire yourself, and live on the street!" "Hold," cried the sage, "you require too much; it suffices to admire oneself!" The fool replied: "But how can one constantly admire without constantly despising?"

214.

Faith Saves.--Virtue gives happiness and a state of blessedness only to those who have a strong faith in their virtue:--not, however, to the more refined souls whose virtue consists of a profound distrust of themselves and of all virtue. After all, therefore, it is "faith that saves" here also!--and be it well observed, _not_ virtue!

215.

The Ideal and the Material.--You have a noble ideal before your eyes: but are you also such a noble stone that such a divine image could be formed out of you? And without that--is not all your labour barbaric sculpturing? A blasphemy of your ideal?

216.

Danger in the Voice.--With a very loud voice a person is almost incapable of reflecting on subtle matters.

217.

Cause and Effect.--Before the effect one believes in other causes than after the effect.

218.

My Antipathy.--I do not like those people who, in order to produce an effect, have to burst like bombs, and in whose neighbourhood one is always in danger of suddenly losing one's hearing--or even something more.

219.

The Object of Punishment.--The object of punishment is to improve him _who punishes,_--that is the ultimate appeal of those who justify punishment.

220.

Sacrifice.--The victims think otherwise than the spectators about sacrifice and sacrificing: but they have never been allowed to express their opinion.

221.

Consideration.--Fathers and sons are much more considerate of one another than mothers and daughters.

222.

Poet and Liar.--The poet sees in the liar his foster-brother whose milk he has drunk up; the latter has thus remained wretched, and has not even attained to a good conscience.

223.

Vicariousness of the Senses.--"We have also eyes in order to hear with them,"--said an old confessor who had grown deaf; "and among the blind he that has the longest ears is king."

224.

Animal Criticism.--I fear the animals regard man as a being like themselves, seriously endangered by the loss of sound animal understanding;--they regard him perhaps as the absurd animal, the laughing animal, the crying animal, the unfortunate animal.

225.

The Natural.--"Evil has always had the great effect! And Nature is evil! Let us therefore be natural!"--so reason secretly the great aspirants after effect, who are too often counted among great men.

226.

The Distrustful and their Style.--We say the strongest things simply, provided people are about us who believe in our strength:--such an environment educates to "simplicity of style." The distrustful, on the other hand, speak emphatically; they make things emphatic.

227.

Fallacy, Fallacy.--He cannot rule himself; therefore that woman concludes that it will be easy to rule him, and throws out her lines to catch him;--the poor creature, who in a short time will be his slave.

228.

Against Mediators.--He who attempts to mediate between two decided thinkers is rightly called mediocre: he has not an eye for seeing the unique; similarising and equalising are signs of weak eyes.

229.

Obstinacy and Loyalty.--Out of obstinacy he holds fast to a cause of which the questionableness has become obvious,--he calls that, however, his "loyalty."

230.

Lack of Reserve.--His whole nature fails to _convince_--that results from the fact that he has never been reticent about a good action he has performed.

231.

The "Plodders."--Persons slow of apprehension think that slowness forms part of knowledge.

232.

Dreaming.--Either one does not dream at all, or one dreams in an interesting manner. One must learn to be awake in the same fashion:--either not at all, or in an interesting manner.

233.

The most Dangerous Point of View.--What I now do, or neglect to do, is as important _for all that is to come,_ as the greatest event of the past: in this immense perspective of effects all actions are equally great and small.

234.

Consolatory Words of a Musician.--"Your life does not sound into people's ears: for them you live a dumb life, and all refinements of melody, all fond resolutions in following or leading the way, are concealed from them. To be sure you do not parade the thoroughfares with regimental music,--but these good people have no right to say on that account that your life is lacking in music. He that hath ears let him hear."

235.

Spirit and Character.--Many a one attains his full height of character, but his spirit is not adapted to the elevation,--and many a one reversely.

236.

To Move the Multitude.--Is it not necessary for him who wants to move the multitude to give a stage representation of himself? Has he not first to translate himself into the grotesquely obvious, and then _set forth_ his whole personality and cause in that vulgarised and simplified fashion?

237.

The Polite Man.--"He is so polite!"--Yes, he has always a sop for Cerberus with him, and is so timid that he takes everybody for Cerberus, even you and me,--that is his "politeness."

238.

Without Envy.--He is wholly without envy, but there is no merit therein: for he wants to conquer a land which no one has yet possessed and hardly any one has even seen.

239.

The Joyless Person.--A single joyless person is enough to make constant displeasure and a clouded heaven in a household; and it is only by a miracle that such a person is lacking!--Happiness is not nearly such a contagious disease;--how is that?

240.

On the Sea-Shore.--I would not build myself a house (it is an element of my happiness not to be a house-owner!). If I had to do so, however, I should build it, like many of the Romans, right into the sea,--I should like to have some secrets in common with that beautiful monster.

241.

Work and Artist.--This artist is ambitious and nothing more; ultimately, however, his work is only a magnifying-glass, which he offers to every one who looks in his direction.

242.

Suum cuique.--However great be my greed of knowledge, I cannot appropriate aught of things but what already belongs to me,--the property of others still remains in the things. How is it possible for a man to be a thief or a robber?

243.

Origin of "Good" and "Bad."--He only will devise an improvement who can feel that "this is not good."

244.

Thoughts and Words.--Even our thoughts we are unable to render completely in words.

245.

Praise in Choice.--The artist chooses his subjects; that is his mode of praising.

246.

Mathematics.--We want to carry the refinement and rigour of mathematics into all the sciences, as far as it is in any way possible, not in the belief that we shall apprehend things in this way, but in order thereby to _assert_ our human relation to things. Mathematics is only a means to general and ultimate human knowledge.

247.

Habits.--All habits make our hand wittier and our wit unhandier.

248.

Books.--Of what account is a book that never carries us away beyond all books?

249.

The Sigh of the Seeker of Knowledge.--"Oh, my covetousness! In this soul there is no disinterestedness--but an all-desiring self, which, by means of many individuals, would fain see as with _its own_ eyes, and grasp as with _its own_ hands--a self bringing back even the entire past, and wanting to lose nothing that could in anyway belong to it! Oh, this flame of my covetousness! Oh, that I were reincarnated in a hundred individuals!"--He who does not know this sigh by experience, does not know the passion of the seeker of knowledge either.

250.

Guilt.--Although the most intelligent judges of the witches, and even the witches themselves, were convinced of the guilt of witchcraft, the guilt, nevertheless, was not there. So it is with all guilt.

251.

Misunderstood Sufferers.--Great natures suffer otherwise than their worshippers imagine; they suffer most severely from the ignoble, petty emotions of certain evil moments; in short, from doubt of their own greatness;--not however from the sacrifices and martyrdoms which their tasks require of them. As long as Prometheus sympathises with men and sacrifices himself for them, he is happy and proud in himself; but on becoming envious of Zeus and of the homage which mortals pay him--then Prometheus suffers!

252.

Better to be in Debt.--"Better to remain in debt than to pay with money which does not bear our stamp!"--that is what our sovereignty prefers.

253.

Always at Home.--One day we attain our _goal_--and then refer with pride to the long journeys we have made to reach it. In truth, we did not notice that we travelled. We got into the habit of thinking that we were _at home_ in every place.

254.

Against Embarrassment.--He who is always thoroughly occupied is rid of all embarrassment.

255.

Imitators.--A: "What? You don't want to have imitators?" B: "I don't want people to do anything _after_ me; I want every one to do something _before_ himself (as a pattern to himself)--just as _I_ do." A: "Consequently--?"

256.

Skinniness.--All profound men have their happiness in imitating the flying-fish at times, and playing on the crests of the waves; they think that what is best of all in things is their surface: their skinniness--_sit venia verbo_.

257.

From Experience.--A person often does not know how rich he is, until he learns from experience what rich men even play the thief on him.

258.

The Deniers of Chance.--No conqueror believes in chance.

259.

From Paradise.--"Good and Evil are God's prejudices"--said the serpent.

260.

One times One.--One only is always in the wrong, but with two truth begins.--One only cannot prove himself right; but two are already beyond refutation.

261.

Originality.--What is originality? To _see_ something that does not yet bear a name, that cannot yet be named, although it is before everybody's eyes. As people are usually constituted, it is the name that first makes a thing generally visible to them.--Original persons have also for the most part been the namers of things.

262.

Sub specie æterni.--A: "You withdraw faster and faster from the living; they will soon strike you out of their lists!"--B: "It is the only way to participate in the privilege of the dead." A: "In what privilege?"--B: "No longer having to die."

263.

Without Vanity.--When we love we want our defects to remain concealed,--not out of vanity, but lest the person loved should suffer therefrom. Indeed, the lover would like to appear as a God,--and not out of vanity either.

264.

What we Do.--What we do is never understood, but only praised and blamed.

265.

Ultimate Scepticism.--But what after all are man's truths?--They are his _irrefutable_ errors.

266.

Where Cruelty is Necessary.--He who is great is cruel to his second-rate virtues and judgments.

267.

With a high Aim.--With a high aim a person is superior even to justice, and not only to his deeds and his judges.

268.

What makes Heroic?--To face simultaneously one's greatest suffering and one's highest hope.

269.

What dost thou Believe in?--In this: That the weights of all things must be determined anew.

270.

What Saith thy Conscience?--"Thou shalt become what thou art."

271.

Where are thy Greatest Dangers?--In pity.

272.

What dost thou Love in others?--My hopes.

273.

Whom dost thou call Bad?--Him who always wants to put others to shame.

274.

What dost thou think most humane?--To spare a person shame.

275.

What is the Seal of Attained Liberty?--To be no longer ashamed of oneself.

BOOK FOURTH

SANCTUS JANUARIUS

Thou who with cleaving fiery lances The stream of my soul from its ice dost free, Till with a rush and a roar it advances To enter with glorious hoping the sea: Brighter to see and purer ever, Free in the bonds of thy sweet constraint,-- So it praises thy wondrous endeavour, January, thou beauteous saint!

Genoa, January 1882.

276.

For the New Year.--I still live, I still think; I must still live, for I must still think. _Sum, ergo cogito: cogito, ergo sum._ To-day everyone takes the liberty of expressing his wish and his favourite thought: well, I also mean to tell what I have wished for myself to-day, and what thought first crossed my mind this year,--a thought which ought to be the basis, the pledge and the sweetening of all my future life! I want more and more to perceive the necessary characters in things as the beautiful:--I shall thus be one of those who beautify things. _Amor fati:_ let that henceforth be my love! I do not want to wage war with the ugly. I do not want to accuse, I do not want even to accuse the accusers. _Looking aside,_ let that be my sole negation! And all in all, to sum up: I wish to be at any time hereafter only a yea-sayer!

277.

Personal Providence.--There is a certain climax in life, at which, notwithstanding all our freedom, and however much we may have denied all directing reason and goodness in the beautiful chaos of existence, we are once more in great danger of intellectual bondage, and have to face our hardest test. For now the thought of a personal Providence first presents itself before us with its most persuasive force, and has the best of advocates, apparentness, in its favour, now when it is obvious that all and everything that happens to us always _turns out for the best._ The life of every day and of every hour seems to be anxious for nothing else but always to prove this proposition anew; let it be what it will, bad or good weather, the loss of a friend, a sickness, a calumny, the non-receipt of a letter, the spraining of one's foot, a glance into a shop-window, a counter-argument, the opening of a book, a dream, a deception:--it shows itself immediately, or very soon afterwards, as something "not permitted to be absent,"--it is full of profound significance and utility precisely _for us!_ Is there a more dangerous temptation to rid ourselves of the belief in the Gods of Epicurus, those careless, unknown Gods, and believe in some anxious and mean Divinity, who knows personally every little hair on our heads, and feels no disgust in rendering the most wretched services? Well--I mean in spite of all this! we want to leave the Gods alone (and the serviceable genii likewise), and wish to content ourselves with the assumption that our own practical and theoretical skilfulness in explaining and suitably arranging events has now reached its highest point. We do not want either to think too highly of this dexterity of our wisdom, when the wonderful harmony which results from playing on our instrument sometimes surprises us too much: a harmony which sounds too well for us to dare to ascribe it to ourselves. In fact, now and then there is one who plays _with_ us--beloved Chance: he leads our hand occasionally, and even the all-wisest Providence could not devise any finer music than that of which our foolish hand is then capable.

278.

The Thought of Death.--It gives me a melancholy happiness to live in the midst of this confusion of streets, of necessities, of voices: how much enjoyment, impatience and desire, how much thirsty life and drunkenness of life comes to light here every moment! And yet it will soon be so still for all these shouting, lively, life-loving people! How everyone's shadow, his gloomy travelling-companion stands behind him! It is always as in the last moment before the departure of an emigrant-ship: people have more than ever to say to one another, the hour presses, the ocean with its lonely silence waits impatiently behind all the noise--so greedy, so certain of its prey! And all, all, suppose that the past has been nothing, or a small matter, that the near future is everything: hence this haste, this crying, this self-deafening and self-overreaching! Everyone wants to be foremost in this future,--and yet death and the stillness of death are the only things certain and common to all in this future! How strange that this sole thing that is certain and common to all, exercises almost no influence on men, and that they are the _furthest_ from regarding themselves as the brotherhood of death! It makes me happy to see that men do not want to think at all of the idea of death! I would fain do something to make the idea of life even a hundred times _more worthy of their attention_.

279.

Stellar Friendship.--We were friends, and have become strangers to each other. But this is as it ought to be, and we do not want either to conceal or obscure the fact, as if we had to be ashamed of it. We are two ships, each of which has its goal and its course; we may, to be sure, cross one another in our paths, and celebrate a feast together as we did before,--and then the gallant ships lay quietly in one harbour, and in one sunshine, so that it might have been thought they were already at their goal, and that they had had one goal. But then the almighty strength of our tasks forced us apart once more into different seas and into different zones, and perhaps we shall never see one another again,--or perhaps we may see one another, but not know one another again; the different seas and suns have altered us! That we had to become strangers to one another is the law to which we are _subject_: just by that shall we become more sacred to one another! Just by that shall the thought of our former friendship become holier! There is probably some immense, invisible curve and stellar orbit in which our courses and goals, so widely different, may be _comprehended_ as small stages of the way,--let us raise ourselves to this thought! But our life is too short, and our power of vision too limited for us to be more than friends in the sense of that sublime possibility.--And so we will _believe_ in our stellar friendship, though we should have to be terrestrial enemies to one another.

280.

Architecture for Thinkers.--An insight is needed (and that probably very soon) as to what is specially lacking in our great cities--namely, quiet, spacious, and widely extended places for reflection, places with long, lofty colonnades for bad weather, or for too sunny days, where no noise of wagons or of shouters would penetrate, and where a more refined propriety would prohibit loud

praying even to the priest: buildings and situations which as a whole would express the sublimity of self-communion and seclusion from the world. The time is past when the Church possessed the monopoly of reflection, when the _vita contemplativa_ had always in the first place to be the _vita religiosa:_ and everything that the Church has built expresses this thought. I know not how we could content ourselves with their structures, even if they should be divested of their ecclesiastical purposes: these structures speak a far too pathetic and too biassed speech, as houses of God and places of splendour for supernatural intercourse, for us godless ones to be able to think _our thoughts_ in them. We want to have _ourselves_ translated into stone and plant, we want to go for a walk in _ourselves_ when we wander in these halls and gardens.

281.

Knowing how to Find the End.--Masters of the first rank are recognised by knowing in a perfect manner how to find the end, in the whole as well as in the part; be it the end of a melody or of a thought, be it the fifth act of a tragedy or of a state affair. The masters of the second degree always become restless towards the end, and seldom dip down into the sea with such proud, quiet equilibrium as for example, the mountain-ridge at _Porto fino_--where the Bay of Genoa sings its melody to an end.

282.

The Gait.--There are mannerisms of the intellect by which even great minds betray that they originate from the populace, or from the semi-populace--it is principally the gait and step, of their thoughts which betray them; they cannot _walk._ It was thus that even Napoleon, to his profound chagrin, could not walk "legitimately" and in princely fashion on occasions when it was necessary to do so properly, as in great coronation processions and on similar occasions: even there he was always just the leader of a column--proud and brusque at the same time, and very self-conscious of it all.--It is something laughable to see those writers who make the folding robes of their periods rustle around them: they want to cover their _feet_.

283.

Pioneers.--I greet all the signs indicating that a more manly and warlike age is commencing, which will, above all, bring heroism again into honour! For it has to prepare the way for a yet higher age, and gather the force which the latter will one day require,--the age which will carry heroism into knowledge, and _wage war_ for the sake of ideas and their consequences. For that end many brave pioneers are now needed, who, however, cannot originate out of nothing,--and just as little out of the sand and slime of present-day civilisation and the culture of great cities: men silent, solitary and resolute, who know how to be content and persistent in invisible activity: men who with innate disposition seek in all things that which is _to be overcome_ in them: men to whom cheerfulness, patience, simplicity, and contempt of the great vanities belong just as much as do magnanimity in victory and indulgence to the trivial vanities of all the vanquished: men with an acute and independent judgment regarding all victors, and concerning the part which chance has played in the winning of victory and fame: men with their own holidays, their own work-days, and their own periods of mourning; accustomed to command with perfect assurance, and equally ready, if need be, to obey, proud in the one case as in the other, equally serving their own interests: men more imperilled, more productive, more happy! For believe me!--the secret of realising the largest productivity and the greatest enjoyment of existence is _to live in danger!_ Build your cities on the slope of Vesuvius! Send your ships into unexplored seas! Live in war with your equals and with yourselves! Be robbers and spoilers, ye knowing ones, as long as ye cannot be rulers and possessors! The time will soon pass when you can be satisfied to live like timorous deer concealed in the forests. Knowledge will finally stretch out her hand for that which belongs to her:--she means to _rule_ and _possess,_ and you with her!

284.

Belief in Oneself--In general, few men have belief in themselves:--and of those few some are endowed with it as a useful blindness or partial obscuration of intellect (what would they perceive if they could see _to the bottom of themselves!_). The others must first acquire the belief for themselves: everything good, clever, or great that they do, is first of all an argument against the sceptic that dwells in them: the question is how to convince or persuade _this sceptic,_ and for that purpose genius almost is needed. They are signally dissatisfied with themselves.

285.

Excelsior!--"Thou wilt never more pray, never more worship, never more repose in infinite trust--thou refusest to stand still and dismiss thy thoughts before an ultimate wisdom, an ultimate virtue, an ultimate power,--thou hast no constant guardian and friend in

thy seven solitudes--thou livest without the outlook on a mountain that has snow on its head and fire in its heart--there is no longer any requiter for thee, nor any amender with, his finishing touch--there is no longer any reason in that which happens, or any love in that which will happen to thee--there is no longer any resting-place for thy weary heart, where it has only to find and no longer to seek, thou art opposed to any kind of ultimate peace, thou desirest the eternal recurrence of war and peace:--man of renunciation, wilt thou renounce in all these things? Who will give thee the strength to do so? No one has yet had this strength!"--There is a lake which one day refused to flow away, and threw up a dam at the place where it had hitherto discharged: since then this lake has always risen higher and higher. Perhaps the very renunciation will also furnish us with the strength with which the renunciation itself can be borne; perhaps man will ever rise higher and higher from that point onward, when he no longer _flows out_ into a God.

286.

A Digression.--Here are hopes; but what will you see and hear of them, if you have not experienced glance and glow and dawn of day in your own souls? I can only suggest--I cannot do more! To move the stones, to make animals men--would you have me do that? Alas, if you are yet stones and animals, you must seek your Orpheus!

287.

Love of Blindness.--"My thoughts," said the wanderer to his shadow, "ought to show me where I stand, but they should not betray to me _whither I go._ I love ignorance of the future, and do not want to come to grief by impatience and anticipatory tasting of promised things."

288.

Lofty Moods.--It seems to me that most men do not believe in lofty moods, unless it be for the moment, or at the most for a quarter of an hour,--except the few who know by experience a longer duration of high feeling. But to be absolutely a man with a single lofty feeling, the incarnation of a single lofty mood--that has hitherto been only a dream and an enchanting possibility: history does not yet give us any trustworthy example of it Nevertheless one might also some day produce such men--when a multitude of favourable conditions have been created and established, which at present even the happiest chance is unable to throw together. Perhaps that very state which has hitherto entered into our soul as an exception, felt with horror now and then, may be the usual condition of those future souls: a continuous movement between high and low, and the feeling of high and low, a constant state of mounting as on steps, and at the same time reposing as on clouds.

289.

Aboard Ship!--When one considers how a full philosophical justification of his mode of living and thinking operates upon every individual--namely, as a warming, blessing, and fructifying sun, specially shining on him; how it makes him independent of praise and blame, self-sufficient, rich and generous in the bestowal of happiness and kindness; how it unceasingly transforms the evil to the good, brings all the energies to bloom and maturity, and altogether hinders the growth of the greater and lesser weeds of chagrin and discontent --one at last cries out importunately: Oh, that many such new suns were created! The evil man, also, the unfortunate man, and the exceptional man, shall each have his philosophy, his rights, and his sunshine! It is not sympathy with them that is necessary!--we must unlearn this arrogant fancy, notwithstanding that humanity has so long learned it and used it exclusively,--we have not to set up any confessor, exorcist, or pardoner for them! It is a new _justice,_ however, that is necessary! And a new solution! And new philosophers! The moral earth also is round! The moral earth also has its antipodes! The antipodes also have their right to exist! there is still another world to discover--and more than one! Aboard ship! ye philosophers!

290.

One Thing is Needful--To "give style" to one's character--that is a grand and a rare art! He who surveys all that his nature presents in its strength and in its weakness, and then fashions it into an ingenious plan, until everything appears artistic and rational, and even the weaknesses enchant the eye--exercises that admirable art. Here there has been a great amount of second nature added, there a portion of first nature has been taken away:--in both cases with long exercise and daily labour at the task. Here the ugly, which does not permit of being taken away, has been concealed, there it has been re-interpreted into the sublime. Much of the vague, which refuses to take form, has been reserved and utilised for the perspectives:--it is meant to give a hint of the remote and immeasurable. In the end, when the work has been completed, it is revealed how it was the constraint of the same taste that organised and fashioned it in whole and in part: whether the taste was good or bad is of less importance than one

thinks,--it is sufficient that it was _a taste!_--It will be the strong imperious natures which experience their most refined joy in such constraint, in such confinement and perfection under their own law; the passion of their violent volition lessens at the sight of all disciplined nature, all conquered and ministering nature: even when they have palaces to build and gardens to lay out, it is not to their taste to allow nature to be free.--It is the reverse with weak characters who have not power over themselves, and _hate_ the restriction of style: they feel that if this repugnant constraint were laid upon them, they would necessarily become _vulgarised_ under it: they become slaves as soon as they serve, they hate service. Such intellects--they may be intellects of the first rank--are always concerned with fashioning and interpreting themselves and their surroundings as _free_ nature--wild, arbitrary, fantastic, confused and surprising: and it is well for them to do so, because only in this manner can they please themselves! For one thing is needful: namely, that man should _attain to_ satisfaction with himself--be it but through this or that fable and artifice: it is only then that man's aspect is at all endurable! He who is dissatisfied with himself is ever ready to avenge himself on that account: we others will be his victims, if only in having always to endure his ugly aspect. For the aspect of the ugly makes one mean and sad.

291.

Genoa.--I have looked upon this city, its villas and pleasure-grounds, and the wide circuit of its inhabited heights and slopes, for a considerable time: in the end I must say that I see _countenances_ out of past generations,--this district is strewn with the images of bold and autocratic men. They have _lived_ and have wanted to live on--they say so with their houses, built and decorated for centuries, and not for the passing hour: they were well disposed to life, however ill-disposed they may often have been towards themselves. I always see the builder, how he casts his eye on all that is built around him far and near, and likewise on the city, the sea, and the chain of mountains; how he expresses power and conquest with his gaze: all this he wishes to fit into _his_ plan, and in the end make it his _property,_ by its becoming a portion of the same. The whole district is overgrown with this superb, insatiable egoism of the desire to possess and exploit; and as these men when abroad recognised no frontiers, and in their thirst for the new placed a new world beside the old, so also at home everyone rose up against everyone else, and devised some mode of expressing his superiority, and of placing between himself and his neighbour his personal illimitableness. Everyone won for himself his home once more by over-powering it with his architectural thoughts, and by transforming it into a delightful sight for his race. When we consider the mode of building cities in the north, the law and the general delight in legality and obedience, impose upon us: we thereby divine the propensity to equality and submission which must have ruled in those builders. Here, however, on turning every corner you find a man by himself, who knows the sea, knows adventure, and knows the Orient, a man who is averse to law and to neighbour, as if it bored him to have to do with them, a man who scans all that is already old and established, with envious glances: with a wonderful craftiness of fantasy, he would like, at least in thought, to establish all this anew, to lay his hand upon it, and introduce his meaning into it--if only for the passing hour of a sunny afternoon, when for once his insatiable and melancholy soul feels satiety, and when only what is his own, and nothing strange, may show itself to his eye.

292.

To the Preachers of Morality.--I do not mean to moralise, but to those who do, I would give this advice: if you mean ultimately to deprive the best things and the best conditions of all honour and worth, continue to speak of them in the same way as heretofore! Put them at the head of your morality, and speak from morning till night of the happiness of virtue, of repose of soul, of righteousness, and of reward and punishment in the nature of things: according as you go on in this manner, all these good things will finally acquire a popularity and a street-cry for themselves: but then all the gold on them will also be worn off, and more besides: all the gold _in them_ will have changed into lead. Truly, you understand the reverse art of alchemy, the depreciating of the most valuable things! Try, just for once, another recipe, in order not to realise as hitherto the opposite of what you mean to attain: _deny_ those good things, withdraw from them the applause of the populace and discourage the spread of them, make them once more the concealed chastities of solitary souls, and say: _morality is something forbidden!_ Perhaps you will thus attract to your cause the sort of men who are only of any account, I mean the _heroic._ But then there must be something formidable in it, and not as hitherto something disgusting I Might one not be inclined to say at present with reference to morality what Master Eckardt says: "I pray God to deliver me from God!"

293.

Our Atmosphere.--We know it well: in him who only casts a glance now and then at science, as when taking a walk (in the manner of women, and alas! also like many artists), the strictness in its service, its inexorability in small matters as well as in great, its rapidity in weighing, judging and condemning, produce something of a feeling of giddiness and fright. It is especially terrifying to

him that the hardest is here demanded, that the best is done without the reward of praise or distinction; it is rather as among soldiers--almost nothing but blame and sharp reprimand _is heard_; for doing well prevails here as the rule, doing ill as the exception; the rule, however, has, here as everywhere, a silent tongue. It is the same with this "severity of science" as with the manners and politeness of the best society: it frightens the uninitiated. He, however, who is accustomed to it, does not like to live anywhere but in this clear, transparent, powerful, and highly electrified atmosphere, this _manly_ atmosphere. Anywhere else it is not pure and airy enough for him: he suspects that _there_ his best art would neither be properly advantageous to anyone else, nor a delight to himself, that through misunderstandings half of his life would slip through his fingers, that much foresight, much concealment, and reticence would constantly be necessary,--nothing but great and useless losses of power! In _this_ keen and clear element, however, he has his entire power: here he can fly! Why should he again go down into those muddy waters where he has to swim and wade and soil his wings!--No! There it is too hard for us to live! we cannot help it that we are born for the atmosphere, the pure atmosphere, we rivals of the ray of light; and that we should like best to ride like it on the atoms of ether, not away from the sun, but _towards the sun_! That, however, we cannot do:--so we want to do the only thing that is in our power: namely, to bring light to the earth, we want to be "the light of the earth!" And for that purpose we have our wings and our swiftness and our severity, on that account we are manly, and even terrible like the fire. Let those fear us, who do not know how to warm and brighten themselves by our influence!

294.

Against the Disparagers of Nature.--They are disagreeable to me, those men in whom every natural inclination forthwith becomes a disease, something disfiguring, or even disgraceful. _They_ have seduced us to the opinion that the inclinations and impulses of men are evil; _they_ are the cause of our great injustice to our own nature, and to all nature! There are enough of men who _may_ yield to their impulses gracefully and carelessly: but they do not do so, for fear of that imaginary "evil thing" in nature! _That is the cause_ why there is so little nobility to be found among men: the indication of which will always be to have no fear of oneself, to expect nothing disgraceful from oneself, to fly without hesitation whithersoever we are impelled--we free-born birds! Wherever we come, there will always be freedom and sunshine around us.

295.

Short-lived Habits.--I love short-lived habits, and regard them as an invaluable means for getting a knowledge of _many_ things and various conditions, to the very bottom of their sweetness and bitterness; my nature is altogether arranged for short-lived habits, even in the needs of its bodily health, and in general, _as far as_ I can see, from the lowest up to the highest matters. I always think that _this_ will at last satisfy me permanently (the short-lived habit has also this characteristic belief of passion, the belief in everlasting duration; I am to be envied for having found it and recognised it), and then it nourishes me at noon and at eve, and spreads a profound satisfaction around me and in me, so that I have no longing for anything else, not needing to compare, or despise, or hate. But one day the habit has had its time: the good thing separates from me, not as something which then inspires disgust in me--but peaceably, and as though satisfied with me, as I am with it; as if we had to be mutually thankful, and _thus_ shook hands for farewell. And already the new habit waits at the door, and similarly also my belief--indestructible fool and sage that I am!--that this new habit will be the right one, the ultimate right one. So it is with me as regards foods, thoughts, men, cities, poems, music, doctrines, arrangements of the day, and modes of life.--On the other hand, I hate _permanent_ habits, and feel as if a tyrant came into my neighbourhood, and as if my life's breath _condensed,_ when events take such a form that permanent habits seem necessarily to grow out of them: for example, through an official position, through constant companionship with the same persons, through a settled abode, or through a uniform state of health. Indeed, from the bottom of my soul I am gratefully disposed to all my misery and sickness, and to whatever is imperfect in me, because such things leave me a hundred back-doors through which I can escape from permanent habits. The most unendurable thing, to be sure, the really terrible thing, would be a life without habits, a life which continually required improvisation:--that would be my banishment and my Siberia.

296.

A Fixed Reputation.--A fixed reputation was formerly a matter of the very greatest utility; and wherever society continues to be ruled by the herd-instinct, it is still most suitable for every individual _to give_ to his character and business _the appearance_ of unalterableness,--even when they are not so in reality. "One can rely on him, he remains the same"--that is the praise which has most significance in all dangerous conditions of society. Society feels with satisfaction that it has a reliable _tool_ ready at all times in the virtue of this one, in the ambition of that one, and in the reflection and passion of a third one,--it honours this _tool-like

nature,_ this self-constancy, this unchangeableness in opinions, efforts, and even in faults, with the highest honours. Such a valuation, which prevails and has prevailed everywhere simultaneously with the morality of custom, educates "characters," and brings all changing, re-learning, and self-transforming into _disrepute._ Be the advantage of this mode of thinking ever so great otherwise, it is in any case the mode of judging which is most injurious _to knowledge:_ for precisely the good-will of the knowing one ever to declare himself unhesitatingly as _opposed_ to his former opinions, and in general to be distrustful of all that wants to be fixed in him--is here condemned and brought into disrepute. The disposition of the thinker, as incompatible with a "fixed reputation," is regarded as _dishonourable,_ while the petrifaction of opinions has all the honour to itself:--we have at present still to live under the interdict of such rules! How difficult it is to live when one feels that the judgment of many millenniums is around one and against one. It is probable that for many millenniums knowledge was afflicted with a bad conscience, and there must have been much self-contempt and secret misery in the history of the greatest intellects.

297.

Ability to Contradict--Everyone knows at present that the ability, to endure contradiction is a good indication of culture. Some people even know that the higher man courts opposition, and provokes it, so as to get a cue to his hitherto unknown partiality. But the _ability_ to contradict, the attainment of a _good_ conscience in hostility to the accustomed, the traditional and the hallowed,--that is more than both the above-named abilities, and is the really great, new and astonishing thing in our culture, the step of all steps of the emancipated intellect: who knows that?--

298.

A Sigh.--I caught this notion on the way, and rapidly took the readiest, poor words to hold it fast, so that it might not again fly away. But it has died in these dry words, and hangs and flaps about in them--and now I hardly know, when I look upon it, how I could have had such happiness when I caught this bird.

299.

What one should Learn from Artists.--What means have we for making things beautiful, attractive, and desirable, when they are not so?--and I suppose they are never so in themselves! We have here something to learn from physicians, when, for example, they dilute what is bitter, or put wine and sugar into their mixing-bowl; but we have still more to learn from artists, who in fact, are continually concerned in devising such inventions and artifices. To withdraw from things until one no longer sees much of them, until one has even to see things into them, _in order to see them at all_--or to view them from the side, and as in a frame--or to place them so that they partly disguise themselves and only permit of perspective views--or to look at them through coloured glasses, or in the light of the sunset--or to furnish them with a surface or skin which is not fully transparent: we should learn all this from artists, and moreover be wiser than they. For this fine power of theirs usually ceases with them where art ceases and life begins; _we,_ however, want to be the poets of our lives, and first of all in the smallest and most commonplace matters.

300.

Prelude to Science.--Do you believe then that the sciences would have arisen and grown up if the sorcerers, alchemists, astrologers and witches had not been their forerunners; those who, with their promisings and foreshadowings, had first to create a thirst, a hunger, and a taste for _hidden and forbidden_ powers? Yea, that infinitely more had to be _promised_ than could ever be fulfilled, in order that something might be fulfilled in the domain of knowledge? Perhaps the whole of _religion,_ also, may appear to some distant age as an exercise and a prelude, in like manner as the prelude and preparation of science here exhibit themselves, though _not_ at all practised and regarded as such. Perhaps religion may have been the peculiar means for enabling individual men to enjoy but once the entire self-satisfaction of a God and all his self-redeeming power. Indeed!--one may ask--would man have learned at all to get on the tracks of hunger and thirst for _himself,_ and to extract satiety and fullness out of _himself,_ without that religious schooling and preliminary history? Had Prometheus first to _fancy_ that he had _stolen_ the light, and that he did penance for the theft,--in order finally to discover that he had created the light, _in that he had longed for the light,_ and that not only man, but also _God,_ had been the work of _his_ hands and the clay in his hands? All mere creations of the creator?--just as the illusion, the theft, the Caucasus, the vulture, and the whole tragic Prometheia of all thinkers?

301.

Illusion of the Contemplative.--Higher men are distinguished from lower, by seeing and hearing immensely more, and in a thoughtful manner--and it is precisely this that distinguishes man from the animal, and the higher animal from the lower. The world always becomes fuller for him who grows up to the full stature of humanity; there are always more interesting fishing-hooks, thrown out to him; the number of his stimuli is continually on the increase, and similarly the varieties of his pleasure and pain,--the higher man becomes always at the same time happier and unhappier. An _illusion,_ however, is his constant accompaniment all along: he thinks he is placed as a _spectator_ and _auditor_ before the great pantomime and concert of life; he calls his nature a _contemplative nature,_ and thereby overlooks the fact that he himself is also a real creator, and continuous poet of life,--that he no doubt differs greatly from the _actor_ in this drama, the so-called practical man, but differs still more from a mere onlooker or spectator _before_ the stage. There is certainly _vis contemplativa,_ and re-examination of his work peculiar to him as poet, but at the same time, and first and foremost, he has the _vis creativa,_ which the practical man or doer _lacks,_ whatever appearance and current belief may say to the contrary. It is we, who think and feel, that actually and unceasingly _make_ something which did not before exist: the whole eternally increasing world of valuations, colours, weights, perspectives, gradations, affirmations and negations. This composition of ours is continually learnt, practised, and translated into flesh and actuality, and even into the commonplace, by the so-called practical men (our actors, as we have said). Whatever has _value_ in the present world, has not it in itself, by its nature,--nature is always worthless:--but a value was once given to it, bestowed upon it and it was _we_ who gave and bestowed! We only have created the world _which is of any account to man!_--But it is precisely this knowledge that we lack, and when we get hold of it for a moment we have forgotten it the next: we misunderstand our highest power, we contemplative men, and estimate ourselves at too low a rate,--we are neither as _proud nor as happy_ as we might be.

302.

The Danger of the Happiest Ones.--To have fine senses and a fine taste; to be accustomed to the select and the intellectually best as our proper and readiest fare; to be blessed with a strong, bold, and daring soul; to go through life with a quiet eye and a firm step, ever ready for the worst as for a festival, and full of longing for undiscovered worlds and seas, men and Gods; to listen to all joyous music, as if there perhaps brave men, soldiers and seafarers, took a brief repose and enjoyment, and in the profoundest pleasure of the moment were overcome with tears and the whole purple melancholy of happiness: who would not like all this to be _his_ possession, his condition! It was the _happiness of Homerr_! The condition of him who invented the Gods for the Greeks,--nay, who invented _his_ Gods for himself! But let us not conceal the fact that with this happiness of Homer in one's soul, one is more liable to suffering than any other creature under the sun! And only at this price do we purchase the most precious pearl that the waves of existence have hitherto washed ashore! As its possessor one always becomes more sensitive to pain, and at last too sensitive: a little displeasure and loathing sufficed in the end to make Homer disgusted with life. He was unable to solve a foolish little riddle which some young fishers proposed to him! Yes, the little riddles are the dangers of the happiest ones!--

303.

Two Happy Ones.--Certainly this man, notwithstanding his youth, understands the _improvisation of life,_ and astonishes even the acutest observers. For it seems that he never makes a mistake, although he constantly plays the most hazardous games. One is reminded of the improvising masters of the musical art, to whom even the listeners would fain ascribe a divine _infallibility_ of the hand, notwithstanding that they now and then make a mistake, as every mortal is liable to do. But they are skilled and inventive, and always ready in a moment to arrange into the structure of the score the most accidental tone (where the jerk of a finger or a humour brings it about), and to animate the accident with a fine meaning and soul.--Here is quite a different man: everything that he intends and plans fails with him in the long run. That on which he has now and again set his heart has already brought him several times to the abyss, and to the very verge of ruin; and if he has as yet got out of the scrape, it certainly has not been merely with a "black eye." Do you think he is unhappy over it? He resolved long ago not to regard his own wishes and plans as of so much importance. "If this does not succeed with me," he says to himself, "perhaps that will succeed; and on the whole I do not know but that I am under more obligation to thank my failures than any of my successes. Am I made to be headstrong, and to wear the bull's horns? That which constitutes the worth and the sum of life _for me,_ lies somewhere else; I know more of life, because I have been so often on the point of losing it; and just on that account I _have_ more of life than any of you!"

304.

In Doing we Leave Undone.--In the main all those moral systems are distasteful to me which say: "Do not do this! Renounce! Overcome thyself!" On the other hand I am favourable to those moral systems which stimulate me to do something, and to do it

again from morning till evening, to dream of it at night, and think of nothing else but to do it _well,_ as well as is possible for _me_ alone! From him who so lives there fall off one after the other the things that do not pertain to such a life: without hatred or antipathy, he sees _this_ take leave of him to-day, and _that_ to-morrow, like the yellow leaves which every livelier breeze strips from the tree: or he does not see at all that they take leave of him, so firmly is his eye fixed upon his goal, and generally forward, not sideways, backward, or downward. "Our doing must determine what we leave undone; in that we do, we leave undone"--so it pleases me, so runs _my placitum._ But I do not mean to strive with open eyes for my impoverishment; I do not like any of the negative virtues whose very essence is negation and self-renunciation.

305.

_Self-control--_Those moral teachers who first and foremost order man to get himself into his own power, induce thereby a curious infirmity in him--namely, a constant sensitiveness with reference to all natural strivings and inclinations, and as it were, a sort of itching. Whatever may henceforth drive him, draw him, allure or impel him, whether internally or externally--it always seems to this sensitive being as if his self-control were in danger: he is no longer at liberty to trust himself to any instinct, to any free flight, but stands constantly with defensive mien, armed against himself, with sharp distrustful eye, the eternal watcher of his stronghold, to which office he has appointed himself. Yes, he can be _great_ in that position! But how unendurable he has now become to others, how difficult even for himself to bear, how impoverished and cut off from the finest accidents of his soul! Yea, even from all further _instruction! _ For we must be able to lose ourselves at times, if we want to learn something of what we have not in ourselves.

306.

Stoic and Epicurean.--The Epicurean selects the situations, the persons, and even the events which suits his extremely sensitive, intellectual constitution; he renounces the rest--that is to say, by far the greater part of experience--because it would be too strong and too heavy fare for him. The Stoic, on the contrary, accustoms himself to swallow stones and vermin, glass-splinters and scorpions, without feeling any disgust: his stomach is meant to become indifferent in the end to all that the accidents of existence cast into it:--he reminds one of the Arabic sect of the Assaua, with which the French became acquainted in Algiers; and like those insensible persons, he also likes well to have an invited public at the exhibition of his insensibility, the very thing the Epicurean willingly dispenses with:--he has of course his "garden"! Stoicism may be quite advisable for men with whom fate improvises, for those who live in violent times and are dependent on abrupt and changeable individuals. He, however, who _anticipates_ that fate will permit him to spin "a long thread," does well to make his arrangements in Epicurean fashion; all men devoted to intellectual labour have done it hitherto! For it would be a supreme loss to them to forfeit their fine sensibility, and to acquire the hard, stoical hide with hedgehog prickles in exchange.

307.

In Favour of Criticism.--Something now appears to thee as an error which thou formerly lovedst as a truth, or as a probability: thou pushest it from thee and imaginest that thy reason has there gained a victory. But perhaps that error was then, when thou wast still another person--thou art always another person,--just as necessary to thee as all thy present "truths," like a skin, as it were, which concealed and veiled from thee much which thou still mayst not see. Thy new life, and not thy reason, has slain that opinion for thee: _thou dost not require it any longer,_ and now it breaks down of its own accord, and the irrationality crawls out of it as a worm into the light. When we make use of criticism it is not something arbitrary and impersonal,--it is, at least very often, a proof that there are lively, active forces in us, which cast a skin. We deny, and must deny, because something in us _wants_ to live and affirm itself, something which we perhaps do not as yet know, do not as yet see!--So much in favour of criticism.

308.

_The History of each Day.--_What is it that constitutes the history of each day for thee? Look at thy habits of which it consists: are they the product of numberless little acts of cowardice and laziness, or of thy bravery and inventive reason? Although the two cases are so different, it is possible that men might bestow the same praise upon thee, and that thou mightst also be equally useful to them in the one case as in the other. But praise and utility and respectability may suffice for him whose only desire is to have a good conscience,--not however for thee, the "trier of the reins," who hast a _consciousness of the conscience!_

309.

Out of the Seventh Solitude.--One day the wanderer shut a door behind him, stood still, and wept. Then he said: "Oh, this inclination and impulse towards the true, the real, the non-apparent, the certain! How I detest it! Why does this gloomy and passionate taskmaster follow just _me?_ I should like to rest, but it does not permit me to do so. Are there not a host of things seducing me to tarry! Everywhere there are gardens of Armida for me, and therefore there will ever be fresh separations and fresh bitterness of heart! I must set my foot forward, my weary wounded foot: and because I feel I must do this, I often cast grim glances back at the most beautiful things which could not detain me--_because_ they could not detain me!"

310.

Will and Wave.--How eagerly this wave comes hither, as if it were a question of its reaching something! How it creeps with frightful haste into the innermost corners of the rocky cliff! It seems that it wants to forestall some one; it seems that something is concealed there that has value, high value.--And now it retreats somewhat more slowly, still quite white with excitement,--is it disappointed? Has it found what it sought? Does it merely pretend to be disappointed?--But already another wave approaches, still more eager and wild than the first, and its soul also seems to be full of secrets, and of longing for treasure-seeking. Thus live the waves,--thus live we who exercise will!--I do not say more.--But what! Ye distrust me? Ye are angry at me, ye beautiful monsters? Do ye fear that I will quite betray your secret? Well! Just be angry with me, raise your green, dangerous bodies as high as ye can, make a wall between me and the sun--as at present! Verily, there is now nothing more left of the world save green twilight and green lightning-flashes. Do as ye will, ye wanton creatures, roar with delight and wickedness--or dive under again, pour your emeralds down into the depths, and cast your endless white tresses of foam and spray over them--it is all the same to me, for all is so well with you, and I am so pleased with you for it all: how could I betray _you!_ For--take this to heart!--I know you and your secret, I know your race! You and I are indeed of one race! You and I have indeed one secret!

311.

Broken Lights.--We are not always brave, and when we are weary, people of our stamp are liable to lament occasionally in this wise:--"It is so hard to cause pain to men--oh, that it should be necessary! What good is it to live concealed, when we do not want to keep to ourselves that which causes vexation? Would it not be more advisable to live in the madding crowd, and compensate individuals for sins that are committed, and must be committed, against mankind in general? Foolish with fools, vain with the vain, enthusiastic with enthusiasts? Would that not be reasonable when there is such an inordinate amount of divergence in the main? When I hear of the malignity of others against me--is not my first feeling that of satisfaction? It is well that it should be so!--I seem to myself to say to them--I am so little in harmony with you, and have so much truth on my side: see henceforth that ye be merry at my expense as often as ye can! Here are my defects and mistakes, here are my illusions, my bad taste, my confusion, my tears, my vanity, my owlish concealment, my contradictions! Here you have something to laugh at! Laugh then, and enjoy yourselves! I am not averse to the law and nature of things, which is that defects and errors should give pleasure!--To be sure, there were once 'more glorious' times, when as soon as any one got an idea, however moderately new it might be, he would think himself so _indispensable_ as to go out into the street with it, and call to everybody: 'Behold! the kingdom of heaven is at hand!'--I should not miss myself, if I were a-wanting. We are none of us indispensable!"--As we have said, however, we do not think thus when we are brave; we do not think _about it_ at all.

312.

My Dog.--I have given a name to my pain, and call it "a dog,"--it is just as faithful, just as importunate and shameless, just as entertaining, just as wise, as any other dog--and I can domineer over it, and vent my bad humour on it, as others do with their dogs, servants, and wives.

313.

No Picture of a Martyr.--I will take my cue from Raphael, and not paint any more martyr-pictures. There are enough of sublime things without its being necessary to seek sublimity where it is linked with cruelty; moreover my ambition would not be gratified in the least if I aspired to be a sublime executioner.

314.

New Domestic Animals.--I want to have my lion and my eagle about me, that I may always have hints and premonitions concerning the amount of my strength or weakness. Must I look down on them to-day, and be afraid of them? And will the hour

come once more when they will look up to me, and tremble?--

315.

The Last Hour.--Storms are my danger. Shall I have my storm in which I perish, as Oliver Cromwell perished in his storm? Or shall I go out as a light does, not first blown out by the wind, but grown tired and weary of itself--a burnt-out light? Or finally, shall I blow myself out, so as _not to burn out?_

316.

Prophetic Men.--Ye cannot divine how sorely prophetic men suffer: ye think only that a fine "gift" has been given to them, and would fain have it yourselves,--but I will express my meaning by a simile. How much may not the animals suffer from the electricity of the atmosphere and the clouds! Some of them, as we see, have a prophetic faculty with regard to the weather, for example, apes (as one can observe very well even in Europe,--and not only in menageries, but at Gibraltar). But it never occurs to us that it is their _sufferings_--that are their prophets! When strong positive electricity, under the influence of an approaching cloud not at all visible, is suddenly converted into negative electricity, and an alteration of the weather is imminent, these animals then behave as if an enemy were approaching them, and prepare for defence, or flight: they generally hide themselves,--they do not think of the bad weather as weather, but as an enemy whose hand they already _feel!_

317.

Retrospect.--We seldom become conscious of the real pathos of any period of life as such, as long as we continue in it, but always think it is the only possible and reasonable thing for us henceforth, and that it is altogether _ethos_ and not _pathos_[1]--to speak and distinguish like the Greeks. A few notes of music to-day recalled a winter and a house, and a life of utter solitude to my mind, and at the same time the sentiments in which I then lived: I thought I should be able to live in such a state always. But now I understand that it was entirely pathos and passion, something comparable to this painfully bold and truly comforting music,--it is not one's lot to have these sensations for years, still less for eternities: otherwise one would become too "ethereal" for this planet.

[1] The distinction between ethos and pathos in Aristotle is, broadly, that between internal character and external circumstance.--P. V. C.

318.

Wisdom in Pain.--In pain there is as much wisdom as in pleasure: like the latter it is one of the best self-preservatives of a species. Were it not so, pain would long ago have been done away with; that it is hurtful is no argument against it, for to be hurtful is its very essence. In pain I hear the commanding call of the ship's captain: "Take in sail!" "Man," the bold seafarer, must have learned to set his sails in a thousand different ways, otherwise he could not have sailed long, for the ocean would soon have swallowed him up. We must also know how to live with reduced energy: as soon as pain gives its precautionary signal, it is time to reduce the speed--some great danger, some storm, is approaching, and we do well to "catch" as little wind as possible--It is true that there are men who, on the approach of severe pain, hear the very opposite call of command, and never appear more proud, more martial, or more happy than when the storm is brewing; indeed, pain itself provides them with their supreme moments! These are the heroic men, the great _pain-bringers_ of mankind: those few and rare ones who need just the same apology as pain generally,--and verily, it should not be denied them! They are forces of the greatest importance for preserving and advancing the species, be it only because they are opposed to smug ease, and do not conceal their disgust at this kind of happiness.

319.

As Interpreters of our Experiences.--One form of honesty has always been lacking among founders of religions and their kin:--they have never made their experiences a matter of the intellectual conscience. "What did I really experience? What then took place in me and around me? Was my understanding clear enough? Was my will directly opposed to all deception of the senses, and courageous in its defence against fantastic notions?"--None of them ever asked these questions, nor to this day do any of the good religious people ask them. They have rather a thirst for things which are _contrary to reason,_ and they don't want to have too much difficulty in satisfying this thirst,--so they experience "miracles" and "regenerations," and hear the voices of angels! But we who are different, who are thirsty for reason, want to look as carefully into our experiences as in the case of a scientific experiment, hour by hour, day by day! We ourselves want to be our own experiments, and our own subjects of experiment.

320.

On Meeting Again.--A: Do I quite understand you? You are in search of something? _Where,_ in the midst of the present, actual world, is _your_ niche and star? Where can _you_ lay yourself in the sun, so that you also may have a surplus of well-being, that your existence may justify itself? Let everyone do that for himself--you seem to say, --and let him put talk about generalities, concern for others and society, out of his mind!--B: I want more; I am no seeker. I want to create my own sun for myself.

321.

A New Precaution.--Let us no longer think so much about punishing, blaming, and improving! We shall seldom be able to alter an individual, and if we should succeed in doing so, something else may also succeed, perhaps unawares: _we_ may have been altered by him! Let us rather see to it that our own influence on _all that is to come_ outweighs and overweighs his influence! Let us not struggle in direct conflict!--all blaming, punishing, and desire to improve comes under this category. But let us elevate ourselves all the higher! Let us ever give to our pattern more shining colours! Let us obscure, the other by our light! No! We do not mean to become _darker_ ourselves on his account, like those who punish and are discontented! Let us rather go aside! Let us look away!

322.

A Simile.--Those thinkers in whom all the stars move in cyclic orbits, are not the most profound. He who looks into himself, as into an immense universe, and carries Milky Ways in himself, knows also how irregular all Milky Ways are; they lead into the very chaos and labyrinth of existence.

323.

Happiness in Destiny.--Destiny confers its greatest distinction upon us when it has made us fight for a time on the side of our adversaries. We are thereby _predestined_ to a great victory.

324.

In Media Vita.--No! Life has not deceived me! On the contrary, from year to year I find it richer, more desirable and more mysterious--from the day on which the great liberator broke my fetters, the thought that life may be an experiment of the thinker--and not a duty, not a fatality, not a deceit!--And knowledge itself may be for others something different; for example, a bed of ease, or the path to a bed of ease, or an entertainment, or a course of idling,--for me it is a world of dangers and victories, in which even the heroic sentiments have their arena and dancing-floor. _"Life as a means to knowledge"_--with this principle in one's heart, one can not only be brave, but can even _live joyfully and laugh joyfully!_ And who could know how to laugh well and live well, who did not first understand the full significance of war and victory?

325.

What Belongs to Greatness.--Who can attain to anything great if he does not feel in himself the force and will _to inflict_ great pain? The ability to suffer is a small matter: in that line, weak women and even slaves often attain masterliness. But not to perish from internal distress and doubt when one inflicts great suffering and hears the cry of it--that is great, that belongs to greatness.

326.

Physicians of the Soul and Pain.--All preachers of morality, as also all theologians, have a bad habit in common: all of them try to persuade man that he is very ill, and that a severe, final, radical cure is necessary. And because mankind as a whole has for centuries listened too eagerly to those teachers, something of the superstition that the human race is in a very bad way has actually come over men: so that they are now far too ready to sigh; they find nothing more in life and make melancholy faces at each other, as if life were indeed very hard _to endure._ In truth, they are inordinately assured of their life and in love with it, and full of untold intrigues and subtleties for suppressing everything disagreeable, and for extracting the thorn from pain and misfortune. It seems to me that people always speak _with exaggeration_ about pain and misfortune, as if it were a matter of good behaviour to exaggerate here: on the other hand people are intentionally silent in regard to the number of expedients for alleviating pain; as for instance, the deadening of it, feverish flurry of thought, a peaceful position, or good and bad reminiscences, intentions, and hopes,--also many kinds of pride and fellow-feeling, which have almost the effect of anæsthetics: while in the greatest degree of pain fainting takes place of itself. We understand very well how to pour sweetness on our bitterness, especially on the bitterness of

our soul; we find a remedy in our bravery and sublimity, as well as in the nobler delirium of submission and resignation. A loss scarcely remains a loss for an hour: in some way or other a gift from heaven has always fallen into our lap at the same moment--a new form of strength, for example: be it but a new opportunity for the exercise of strength! What have the preachers of morality not dreamt concerning the inner "misery" of evil men! What _lies_ have they not told us about the misfortunes of impassioned men! Yes, lying is here the right word: they were only too well aware of the overflowing happiness of this kind of man, but they kept silent as death about it; because it was a refutation of their theory, according to which happiness only originates through the annihilation of the passions and the silencing of the will! And finally, as regards the recipe of all those physicians of the soul and their recommendation of a severe radical cure, we may be allowed to ask: Is our life really painful and burdensome enough for us to exchange it with advantage for a Stoical mode of living, and Stoical petrification? We do _not_ feel _sufficiently miserable_ to have to feel ill in the Stoical fashion!

327.

Taking Things Seriously.--The intellect is with most people an awkward, obscure and creaking machine, which is difficult to set in motion: they call it "_taking a thing seriously_" when they work with this machine and want to think well--oh, how burdensome must good thinking be to them! That delightful animal, man, seems to lose his good-humour whenever he thinks well; he becomes "serious"! And "where there is laughing and gaiety, thinking cannot be worth anything: "--so speaks the prejudice of this serious animal against all "Joyful Wisdom."--Well, then! Let us show that it is prejudice!

328.

Doing Harm to Stupidity.--It is certain that the belief in the reprehensibility of egoism, preached with such stubbornness and conviction, has on the whole done harm to egoism (_in favour of the herd-instinct,_ as I shall repeat a hundred times!), especially by depriving it of a good conscience, and by bidding us seek in it the source of all misfortune. "Thy selfishness is the bane of thy life"--so rang the preaching for millenniums: it did harm, as we have said, to selfishness, and deprived it of much spirit, much cheerfulness, much ingenuity, and much beauty; it stultified and deformed and poisoned selfishness!--Philosophical antiquity, on the other hand, taught that there was another principal source of evil: from Socrates downwards, the thinkers were never weary of preaching that "your thoughtlessness and stupidity, your unthinking way of living according to rule, and your subjection to the opinion of your neighbour, are the reasons why you so seldom attain to happiness,--we thinkers are, as thinkers, the happiest of mortals." Let us not decide here whether this preaching against stupidity was more sound than the preaching against selfishness; it is certain, however, that stupidity was thereby deprived of its good conscience:--those philosophers _did harm to stupidity._

329.

Leisure and Idleness.--There is an Indian savagery, a savagery peculiar to the Indian blood, in the manner in which the Americans strive after gold: and the breathless hurry of their work--the characteristic vice of the new world--already begins to infect old Europe, and makes it savage also, spreading over it a strange lack of intellectuality. One is now ashamed of repose: even long reflection almost causes remorse of conscience. Thinking is done with a stop-watch, as dining is done with the eyes fixed on the financial newspaper; we live like men who are continually "afraid of letting opportunities slip." "Better do anything whatever, than nothing"--this principle also is a noose with which all culture and all higher taste may be strangled. And just as all form obviously disappears in this hurry of workers, so the sense for form itself, the ear and the eye for the melody of movement, also disappear. The proof of this is the _clumsy perspicuity_ which is now everywhere demanded in all positions where a person would like to be sincere with his fellows, in intercourse with friends, women, relatives, children, teachers, pupils, leaders and princes,--one has no longer either time or energy for ceremonies, for roundabout courtesies, for any _esprit_ in conversation, or for any _otium_ whatever. For life in the hunt for gain continually compels a person to consume his intellect, even to exhaustion, in constant dissimulation, overreaching, or forestalling: the real virtue nowadays is to do something in a shorter time than another person. And so there are only rare hours of sincere intercourse _permitted:_ in them, however, people are tired, and would not only like "to let themselves go," but _to stretch their legs_ out wide in awkward style. The way people write their _letters_ nowadays is quite in keeping with the age; their style and spirit will always be the true "sign of the times." If there be still enjoyment in society and in art, it is enjoyment such as over-worked slaves provide for themselves. Oh, this moderation in "joy" of our cultured and uncultured classes! Oh, this increasing suspiciousness of all enjoyment! _Work_ is winning over more and more the good conscience to its side: the desire for enjoyment already calls itself "need of recreation," and even begins to be ashamed of itself. "One owes it to one's health," people say, when they are caught at a picnic. Indeed, it might soon go so far that one could not yield to the desire for

the _vita contemplativa_ (that is to say, excursions with thoughts and friends), without self-contempt and a bad conscience.--Well! Formerly it was the very reverse: it was "action" that suffered from a bad conscience. A man of good family _concealed_ his work when need compelled him to labour. The slave laboured under the weight of the feeling that he did something contemptible:--the "doing" itself was something contemptible. "Only in _otium_ and _bellum_ is there nobility and honour:" so rang the voice of ancient prejudice!

330.

Applause.--The thinker does not need applause or the clapping of hands, provided he be sure of the clapping of his own hands: the latter, however, he cannot do without. Are there men who could also do without this, and in general without any kind of applause? I doubt it: and even as regards the wisest, Tacitus, who is no calumniator of the wise, says: _quando etiam sapientibus gloriæ cupido novissima exuitur_--that means with him: never.

331.

Better Deaf than Deafened.--Formerly a person wanted to have his _calling,_ but that no longer suffices to-day, for the market has become too large,--there has now to be _bawling._ The consequence is that even good throats outcry each other, and the best wares are offered for sale with hoarse voices; without market-place bawling and hoarseness there is now no longer any genius.--It is, sure enough, an evil age for the thinker: he has to learn to find his stillness betwixt two noises, and has to pretend to be deaf until he finally becomes so. As long as he has not learned this, he is in danger of perishing from impatience and headaches.

332.

The Evil Hour.--There has perhaps been an evil hour for every philosopher, in which he thought: What do I matter, if people should not believe my poor arguments!--And then some malicious bird has flown past him and twittered: "What do you matter? What do you matter?"

333.

What does Knowing Mean?--Non ridere, non lugere, neque detestari, sed intelligere! says Spinoza, so simply and sublimely, as is his wont. Nevertheless, what else is this _intelligere_ ultimately, but just the form in which the three other things become perceptible to us all at once? A result of the diverging and opposite impulses of desiring to deride, lament and execrate? Before knowledge is possible each of these impulses must first have brought forward its one-sided view of the object or event. The struggle of these one-sided views occurs afterwards, and out of it there occasionally arises a compromise, a pacification, a recognition of rights on all three sides, a sort of justice and agreement: for in virtue of the justice and agreement all those impulses can maintain themselves in existence and retain their mutual rights. We, to whose consciousness only the closing reconciliation scenes and final settling of accounts of these long processes manifest themselves, think on that account that _intelligere_ is something conciliating, just and good, something essentially antithetical to the impulses; whereas it is only _a certain relation of the impulses to one another._ For a very long time conscious thinking was regarded as the only thinking: it is now only that the truth dawns upon us that the greater part of our intellectual activity goes on unconsciously and unfelt by us; I believe, however, that the impulses which are here in mutual conflict understand rightly how to make themselves felt by _one another,_ and how to cause pain:--the violent sudden exhaustion which overtakes all thinkers, may have its origin here (it is the exhaustion of the battle-field). Aye, perhaps in our struggling interior there is much concealed _heroism,_ but certainly nothing divine, or eternally-reposing-in-itself, as Spinoza supposed. _Conscious_ thinking, and especially that of the philosopher, is the weakest, and on that account also the relatively mildest and quietest mode of thinking: and thus it is precisely the philosopher who is most easily misled concerning the nature of knowledge.

334.

_One must Learn to Love.--_This is our experience in music: we must first _learn_ in general _to hear,_ to hear fully, and to distinguish a theme or a melody, we have to isolate and limit it as a life by itself; then we need to exercise effort and good-will in order _to endure_ it in spite of its strangeness we need patience towards its aspect and expression and indulgence towards what is odd in it:--in the end there comes a moment when we are _accustomed_ to it, when we expect it, when it dawns upon us that we should miss it if it were lacking; and then it goes on to exercise its spell and charm more and more, and does not cease until we have become its humble and enraptured lovers, who want it, and want it again, and ask for nothing better from the world.--It is thus

with us, however, not only in music: it is precisely thus that we have _learned to love_ everything that we love. We are always finally recompensed for our good-will, our patience reasonableness and gentleness towards what is unfamiliar, by the unfamiliar slowly throwing off its veil and presenting itself to us as a new, ineffable beauty:--that is its _thanks_ for our hospitality. He also who loves himself must have learned it in this way: there is no other way. Love also has to be learned.

335.

Cheers for Physics!--How many men are there who know how to observe? And among the few who do know,--how many observe themselves? "Everyone is furthest from himself"--all the "triers of the reins" know that to their discomfort; and the saying, "Know thyself," in the mouth of a God and spoken to man, is almost a mockery. But that the case of self-observation is so desperate, is attested best of all by the manner in which _almost everybody_ talks of the nature of a moral action, that prompt, willing, convinced, loquacious manner, with its look, its smile, and its pleasing eagerness! Everyone seems inclined to say to you: "Why, my dear Sir, that is precisely _my_ affair! You address yourself with your question to him who _is authorised_ to answer, for I happen to be wiser with regard to this matter than in anything else. Therefore, when a man decides that '_this is right_,' when he accordingly concludes that '_it must therefore be done,_ and thereupon _does_ what he has thus recognised as right and designated as necessary--then the nature of his action is _moral!"_ But, my friend, you are talking to me about three actions instead of one: your deciding, for instance, that "this is right," is also an action,--could one not judge either morally or immorally? _Why_ do you regard this, and just this, as right?--"Because my conscience tells me so; conscience never speaks immorally, indeed it determines in the first place what shall be moral!"--But why do you _listen_ to the voice of your conscience? And in how far are you justified in regarding such a judgment as true and infallible? This _belief_--is there no further conscience for it? Do you know nothing of an intellectual conscience? A conscience behind your "conscience"? Your decision, "this is right," has a previous history in your impulses, your likes and dislikes, your experiences and non-experiences; "_how_ has it originated?" you must ask, and afterwards the further question: "_what_ really impels me to give ear to it?" You can listen to its command like a brave soldier who hears the command of his officer. Or like a woman who loves him who commands. Or like a flatterer and coward, afraid of the commander. Or like a blockhead who follows because he has nothing to say to the contrary. In short, you can give ear to your conscience in a hundred different ways. But _that_ you hear this or that judgment as the voice of conscience, consequently, _that_ you feel a thing to be right--may have its cause in the fact that you have never thought about your nature, and have blindly accepted from your childhood what has been designated to you as _right:_ or in the fact that hitherto bread and honours have fallen to your share with that which you call your duty,--it is "right" to you, because it seems to be _your_ "condition of existence" (that you, however, have a _right_ to existence seems to you irrefutable!). The _persistency_ of your moral judgment might still be just a proof of personal wretchedness or impersonality; your "moral force" might have its source in your obstinacy--or in your incapacity to perceive new ideals! And to be brief: if you had thought more acutely, observed more accurately, and had learned more, you would no longer under all circumstances call this and that your "duty" and your "conscience": the knowledge _how moral judgments have in general always originated_ would make you tired of these pathetic words,--as you have already grown tired of other pathetic words, for instance "sin," "salvation," and "redemption."--And now, my friend, do not talk to me about the categorical imperative! That word tickles my ear, and I must laugh in spite of your presence and your seriousness. In this connection I recollect old Kant, who, as a punishment for having _gained possession surreptitiously_ of the "thing in itself"--also a very ludicrous affair!--was imposed upon by the categorical imperative, and with that in his heart _strayed back again_ to "God," the "soul," "freedom," and "immortality," like a fox which strays back into its cage: and it had been _his_ strength and shrewdness which had _broken open_ this cage!--What? You admire the categorical imperative in you? This "persistency" of your so-called moral judgment? This absoluteness of the feeling that "as I think on this matter, so must everyone think"? Admire rather your _selfishness_ therein! And the blindness, paltriness, and modesty of your selfishness! For it is selfishness in a person to regard _his_ judgment as universal law, and a blind, paltry and modest selfishness besides, because it betrays that you have not yet discovered yourself, that you have not yet created for yourself any personal, quite personal ideal:--for this could never be the ideal of another, to say nothing of all, of every one!--He who still thinks that "each would have to act in this manner in this case," has not yet advanced half a dozen paces in self-knowledge: otherwise he would know that there neither are, nor can be, similar actions,--that every action that has been done, has been done in an entirely unique and inimitable manner, and that it will be the same with regard to all future actions; that all precepts of conduct (and even the most esoteric and subtle precepts of all moralities up to the present), apply only to the coarse exterior,--that by means of them, indeed, a semblance of equality can be attained, _but only a semblance,_--that in outlook and retrospect, _every_ action is, and remains, an impenetrable affair, --that our opinions of the "good," "noble" and "great" can never be proved by our actions, because no action is cognisable,--that our opinions, estimates, and tables of values are certainly among the most powerful levers in the mechanism of our actions, that in every single case, nevertheless, the law of their mechanism is

untraceable. Let us _confine_ ourselves, therefore, to the purification of our opinions and appreciations, and to the _construction of new tables of value of our own:_--we will, however, brood no longer over the "moral worth of our actions"! Yes, my friends! As regards the whole moral twaddle of people about one another, it is time to be disgusted with it! To sit in judgment morally ought to be opposed to our taste! Let us leave this nonsense and this bad taste to those who have nothing else to do, save to drag the past a little distance further through time, and who are never themselves the present,--consequently to the many, to the majority! We, however, _would seek to become what we are,--_the new, the unique, the incomparable, making laws for ourselves and creating ourselves! And for this purpose we must become the best students and discoverers of all the laws and necessities in the world. We must be _physicists_ in order to be _creators_ in that sense--whereas hitherto all appreciations and ideals have been based on _ignorance_ of physics, or in _contradiction_ thereto. And therefore, three cheers for physics! And still louder cheers for that which _impels_ us thereto--our honesty.

336.

Avarice of Nature--Why has nature been so niggardly towards humanity that she has not let human beings shine, this man more and that man less, according to their inner abundance of light? Why have not great men such a fine visibility in their rising and setting as the sun? How much less equivocal would life among men then be!

337.

_Future "Humanity."--_When I look at this age with the eye of a distant future, I find nothing so remarkable in the man of the present day as his peculiar virtue and sickness called "the historical sense." It is a tendency to something quite new and foreign in history: if this embryo were given several centuries and more, there might finally evolve out of it a marvellous plant, with a smell equally marvellous, on account of which our old earth might be more pleasant to live in than it has been hitherto. We moderns are just beginning to form the chain of a very powerful, future sentiment, link by link,--we hardly know what we are doing. It almost seems to us as if it were not the question of a new sentiment, but of the decline of all old sentiments:--the historical sense is still something so poor and cold, and many are attacked by it as by a frost, and are made poorer and colder by it. To others it appears as the indication of stealthily approaching age, and our planet is regarded by them as a melancholy invalid, who, in order to forget his present condition, writes the history of his youth. In fact, this is one aspect of the new sentiment. He who knows how to regard the history of man in its entirety as _his own history,_ feels in the immense generalisation all the grief of the invalid who thinks of health, of the old man who thinks of the dream of his youth, of the lover who is robbed of his beloved, of the martyr whose ideal is destroyed, of the hero on the evening of the indecisive battle which has brought him wounds and the loss of a friend. But to bear this immense sum of grief of all kinds, to be able to bear it, and yet still be the hero who at the commencement of a second day of battle greets the dawn and his happiness, as one who has an horizon of centuries before and behind him, as the heir of all nobility, of all past intellect, and the obligatory heir (as the noblest) of all the old nobles; while at the same time the first of a new nobility, the equal of which has never been seen nor even dreamt of: to take all this upon his soul, the oldest, the newest, the losses, hopes, conquests, and victories of mankind: to have all this at last in one soul, and to comprise it in one feeling:--this would necessarily furnish a happiness which man has not hitherto known,--a God's happiness, full of power and love, full of tears and laughter, a happiness which, like the sun in the evening, continually gives of its inexhaustible riches and empties into the sea,--and like the sun, too, feels itself richest when even the poorest fisherman rows with golden oars! This divine feeling might then be called--humanity!

338.

The Will to Suffering and the Compassionate.--Is it to your advantage to be above all compassionate? And is it to the advantage of the sufferers when you are so? But let us leave the first question for a moment without an answer.--That from which we suffer most profoundly and personally is almost incomprehensible and inaccessible to every one else: in this matter we are hidden from our neighbour even when he eats at the same table with us. Everywhere, however, where we are _noticed_ as sufferers, our suffering is interpreted in a shallow way; it belongs to the nature of the emotion of pity to _divest_ unfamiliar suffering of its properly personal character:--our "benefactors" lower our value and volition more than our enemies. In most benefits which are conferred on the unfortunate there is something shocking in the intellectual levity with which the compassionate person plays the rôle of fate: he knows nothing of all the inner consequences and complications which are called misfortune for _me_ or for _you!_ The entire economy of my soul and its adjustment by "misfortune," the uprising of new sources and needs, the closing up of old wounds, the repudiation of whole periods of the past--none of these things which may be connected with misfortune preoccupy the dear

sympathiser. He wishes _to succour,_ and does not reflect that there is a personal necessity for misfortune; that terror, want, impoverishment, midnight watches, adventures, hazards and mistakes are as necessary to me and to you as their opposites, yea, that, to speak mystically, the path to one's own heaven always leads through the voluptuousness of one's own hell. No, he knows nothing thereof. The "religion of compassion" (or "the heart") bids him help, and he thinks he has helped best when he has helped most speedily! If you adherents of this religion actually have the same sentiments towards yourselves which you have towards your fellows, if you are unwilling to endure your own suffering even for an hour, and continually forestall all possible misfortune, if you regard suffering and pain generally as evil, as detestable, as deserving of annihilation, and as blots on existence, well, you have then, besides your religion of compassion, yet another religion in your heart (and this is perhaps the mother of the former)--_the religion of smug ease._ Ah, how little you know of the _happiness_ of man, you comfortable and good-natured ones!--for happiness and misfortune are brother and sister, and twins, who grow tall together, or, as with you, _remain small_ together! But now let us return to the first question.--How is it at all possible for a person to keep to _his_ path! Some cry or other is continually calling one aside: our eye then rarely lights on anything without it becoming necessary for us to leave for a moment our own affairs and rush to give assistance. I know there are hundreds of respectable and laudable methods of making me stray _from my course,_ and in truth the most "moral" of methods! Indeed, the opinion of the present-day preachers of the morality of compassion goes so far as to imply that just this, and this alone is moral:--to stray from _our_ course to that extent and to run to the assistance of our neighbour. I am equally certain that I need only give myself over to the sight of one case of actual distress, and I, too, _am_ lost! And if a suffering friend said to me, "See, I shall soon die, only promise to die with me"--I might promise it, just as--to select for once bad examples for good reasons--the sight of a small, mountain people struggling for freedom,. would bring me to the point of offering them my hand and my life. Indeed, there is even a secret seduction in all this awakening of compassion, and calling for help: our "own way" is a thing too hard and insistent, and too far removed from the love and gratitude of others,--we escape from it and from our most personal conscience, not at all unwillingly, and, seeking security in the conscience of others, we take refuge in the lovely temple of the "religion of pity." As soon now as any war breaks out, there always breaks out at the same time a certain secret delight precisely in the noblest class of the people: they rush with rapture to meet the new danger of _death,_ because they believe that in the sacrifice for their country they have finally that long-sought-for permission--the permission _to shirk their aim:_--war is for them a detour to suicide, a detour, however, with a good conscience. And although silent here about some things, I will not, however, be silent about my morality, which says to me: Live in concealment in order that thou _mayest_ live to thyself. Live _ignorant_ of that which seems to thy age to be most important! Put at least the skin of three centuries betwixt thyself, and the present day! And the clamour of the present day, the noise of wars and revolutions, ought to be a murmur to thee! Thou wilt also want to help, but only those whose distress thou entirely _understandest,_ because they have _one_ sorrow and _one_ hope in common with thee--thy _friends:_ and only in _the_ way that thou helpest thyself:--I want to make them more courageous, more enduring, more simple, more joyful! I want to teach them that which at present so few understand, and the preachers of fellowship in sorrow least of all:--namely, _fellowship in joy!_

339.

Vita femina.--To see the ultimate beauties in a work--all knowledge and good-will is not enough; it requires the rarest, good chance for the veil of clouds to move for once from the summits, and for the sun to shine on them. We must not only stand at precisely the right place to see this, our very soul itself must have pulled away the veil from its heights, and must be in need of an external expression and simile, so as to have a hold and remain master of itself. All these, however, are so rarely united at the same time that I am inclined to believe that the highest summit of all that is good, be it work, deed, man, or nature, has hitherto remained for most people, and even for the best, as something concealed and shrouded:--that, however, which unveils itself to us, _unveils itself to us but once._ The Greeks indeed prayed: "Twice and thrice, everything beautiful!" Ah, they had their good reason to call on the Gods, for ungodly actuality does not furnish us with the beautiful at all, or only does so once! I mean to say that the world is overfull of beautiful things, but it is nevertheless poor, very poor, in beautiful moments, and in the unveiling of those beautiful things. But perhaps this is the greatest charm of life: it puts a gold-embroidered veil of lovely potentialities over itself, promising, resisting, modest, mocking, sympathetic, seductive. Yes, life is a woman!

340.

The Dying Socrates.---I admire the courage and wisdom of Socrates in all that he did, said--and did not say. This mocking and amorous demon and rat-catcher of Athens, who made the most insolent youths tremble and sob, was not only the wisest babbler that has ever lived, but was just as great in his silence. I would that he had also been silent in the last moment of his life,--perhaps he might then have belonged to a still higher order of intellects. Whether it was death, or the poison, or piety, or

wickedness--something or other loosened his tongue at that moment, and he said: "O Crito, I owe a cock to Asclepios." For him who has ears, this ludicrous and terrible "last word" implies: "O Crito, _life is a long sickness!"_ Is it possible! A man like him, who had lived cheerfully and to all appearance as a soldier,--was a pessimist! He had merely put on a good demeanour towards life, and had all along concealed his ultimate judgment, his profoundest sentiment! Socrates, Socrates _had suffered from life!_ And he also took his revenge for it--with that veiled, fearful, pious, and blasphemous phrase! Had even a Socrates to revenge himself? Was there a grain too little of magnanimity in his superabundant virtue? Ah, my friends! We must surpass even the Greeks!

341.

The Heaviest Burden.--What if a demon crept after thee into thy loneliest loneliness some day or night, and said to thee: "This life, as thou livest it at present, and hast lived it, thou must live it once more, and also innumerable times; and there will be nothing new in it, but every pain and every joy and every thought and every sigh, and all the unspeakably small and great in thy life must come to thee again, and all in the same series and sequence--and similarly this spider and this moonlight among the trees, and similarly this moment, and I myself. The eternal sand-glass of existence will ever be turned once more, and thou with it, thou speck of dust!"--Wouldst thou not throw thyself down and gnash thy teeth, and curse the demon that so spake? Or hast thou once experienced a tremendous moment in which thou wouldst answer him: "Thou art a God, and never did I hear anything so divine!" If that thought acquired power over thee as thou art, it would transform thee, and perhaps crush thee; the question with regard to all and everything: "Dost thou want this once more, and also for innumerable times?" would lie as the heaviest burden upon thy activity! Or, how wouldst thou have to become favourably inclined to thyself and to life, so as _to long for nothing more ardently_ than for this last eternal sanctioning and sealing?--

342.

Incipit Tragœdia.--When Zarathustra was thirty years old, he left his home and the Lake of Urmi, and went into the mountains. There he enjoyed his spirit and his solitude, and for ten years did not weary of it. But at last his heart changed,--and rising one morning with the rosy dawn, he went before the sun and spake thus to it: "Thou great star! What would be thy happiness if thou hadst not those for whom thou shinest! For ten years hast thou climbed hither unto my cave: thou wouldst have wearied of thy light and of the journey, had it not been for me, mine eagle, and my serpent. But we awaited thee every morning, took from thee thine overflow, and blessed thee for it. Lo! I am weary of my wisdom, like the bee that hath gathered too much honey; I need hands outstretched to take it. I would fain bestow and distribute, until the wise have once more become joyous in their folly, and the poor happy in their riches. Therefore must I descend into the deep, as thou doest in the evening, when thou goest behind the sea and givest light also to the nether-world, thou most rich star! Like thee must I _go down,_ as men say, to whom I shall descend. Bless me then, thou tranquil eye, that canst behold even the greatest happiness without envy! Bless the cup that is about to overflow, that the water may flow golden out of it, and carry everywhere the reflection of thy bliss! Lo! This cup is again going to empty itself, and Zarathustra is again going to be a man."--Thus began Zarathustra's down-going.

BOOK FIFTH

FEARLESS ONES

"Carcasse, tu trembles? Tu tremblerais bien davantage, tu savais, où je te mène." _Turenne._

343.

What our Cheerfulness Signifies.--The most important of more recent events--that "God is dead," that the belief in the Christian God has become unworthy of belief--already begins to cast its first shadows over Europe. To the few at least whose eye, whose _suspecting_ glance, is strong enough and subtle enough for this drama, some sun seems to have set, some old, profound confidence seems to have changed into doubt: our old world must seem to them daily more darksome, distrustful, strange and "old." In the main, however, one may say that the event itself is far too great, too remote, too much beyond most people's power of apprehension, for one to suppose that so much as the report of it could have _reached_ them; not to speak of many who already knew _what_ had taken place, and what must all collapse now that this belief had been undermined,--because so much was built upon it, so much rested on it, and had become one with it: for example, our entire European morality. This lengthy, vast and uninterrupted process of crumbling, destruction, ruin and overthrow which is now imminent: who has realised it sufficiently to-day to

have to stand up as the teacher and herald of such a tremendous logic of terror, as the prophet of a period of gloom and eclipse, the like of which has probably never taken place on earth before?... Even we, the born riddle-readers, who wait as it were on the mountains posted 'twixt to-day and to-morrow, and engirt by their contradiction, we, the firstlings and premature children of the coming century, into whose sight especially the shadows which must forthwith envelop Europe _should_ already have come--how is it that even we, without genuine sympathy for this period of gloom, contemplate its advent without any _personal_ solicitude or fear? Are we still, perhaps, too much under the _immediate effects_ of the event--and are these effects, especially as regards _ourselves,_ perhaps the reverse of what was to be expected--not at all sad and depressing, but rather like a new and indescribable variety of light, happiness, relief, enlivenment, encouragement, and dawning day?... In fact, we philosophers and "free spirits" feel ourselves irradiated as by a new dawn by the report that the "old God is dead"; our hearts overflow with gratitude, astonishment, presentiment and expectation. At last the horizon seems open once more, granting even that it is not bright; our ships can at last put out to sea in face of every danger; every hazard is again permitted to the discerner; the sea, _our_ sea, again lies open before us; perhaps never before did such an "open sea" exist.--

344.

To what Extent even We are still Pious.--It is said with good reason that convictions have no civic rights in the domain of science: it is only when a conviction voluntarily condescends to the modesty of an hypothesis, a preliminary standpoint for experiment, or a regulative fiction, that its access to the realm of knowledge, and a certain value therein, can be conceded,--always, however, with the restriction that it must remain under police supervision, under the police of our distrust.--Regarded more accurately, however, does not this imply that only when a conviction _ceases_ to be a conviction can it obtain admission into science? Does not the discipline of the scientific spirit just commence when one no longer harbours any conviction?... It is probably so: only, it remains to be asked whether, _in order that this discipline may commence,_ it is not necessary that there should already be a conviction, and in fact one so imperative and absolute, that it makes a sacrifice of all other convictions. One sees that science also rests on a belief: there is no science at all "without premises." The question whether _truth_ is necessary, must not merely be affirmed beforehand, but must be affirmed to such an extent that the principle, belief, or conviction finds expression, that "there is _nothing more necessary_ than truth, and in comparison with it everything else has only secondary value."--This absolute will to truth: what is it? Is it the will _not to allow ourselves to be deceived?_ Is it the will _not to deceive?_ For the will to truth could also be interpreted in this fashion, provided one included under the generalisation, "I will not deceive," the special case, "I will not deceive myself." But why not deceive? Why not allow oneself to be deceived?--Let it be noted that the reasons for the former eventuality belong to a category quite different from those for the latter: one does not want to be deceived oneself, under the supposition that it is injurious, dangerous, or fatal to be deceived,--in this sense science would be a prolonged process of caution, foresight and utility; against which, however, one might reasonably make objections. What? is not-wishing-to-be-deceived really less injurious, less dangerous, less fatal? What do you know of the character of existence in all its phases to be able to decide whether the greater advantage is on the side of absolute distrust, or of absolute trustfulness? In case, however, of both being necessary, much trusting _and_ much distrusting, whence then should science derive the absolute belief, the conviction on which it rests, that truth is more important than anything else, even than every other conviction? This conviction could not have arisen if truth _and_ untruth had both continually proved themselves to be useful: as is the case. Thus--the belief in science, which now undeniably exists, cannot have had its origin in such a utilitarian calculation, but rather _in spite of_ the fact of the inutility and dangerousness of the "Will to truth," of "truth at all costs," being continually demonstrated. "At all costs": alas, we understand that sufficiently well, after having sacrificed and slaughtered one belief after another at this altar!--Consequently, "Will to truth" does _not_ imply, "I will not allow myself to be deceived," but--there is no other alternative--"I will not deceive, not even myself": _and thus we have reached the realm of morality._ For, let one just ask oneself fairly: "Why wilt thou not deceive?" especially if it should seem--and it does seem--as if life were laid out with a view to appearance, I mean, with a view to error deceit, dissimulation, delusion, self-delusion; and when on the other hand it is a matter of fact that the great type of life has always manifested itself on the side of the most unscrupulous πολ■τροποι. Such an intention might perhaps, to express it mildly, be a piece of Quixotism, a little enthusiastic craziness; it might also, however, be something worse, namely, a destructive principle, hostile to life.... "Will to Truth,"--that might be a concealed Will to Death.--Thus the question Why is there science? leads back to the moral problem: _What in general is the purpose of morality,_ if life, nature, and history are "non-moral"? There is no doubt that the conscientious man in the daring and extreme sense in which he is presupposed by the belief in science, _affirms thereby a world other than_ that of life, nature, and history; and in so far as he affirms this "other world," what? must he not just thereby--deny its counterpart, this world, _our_ world?... But what I have in view will now be understood, namely, that it is always a _metaphysical belief_ on which our belief in science rests,--and that even we knowing ones of to-day, landless and anti-metaphysical, still take _our_ fire from the conflagration kindled by a belief a millennium

old, the Christian belief, which was also the belief of Plato, that God is truth, that the truth is divine.... But what if this itself always becomes more untrustworthy, what if nothing any longer proves itself divine, except it be error, blindness, and falsehood;--what if God himself turns out to be our most persistent lie?--

345.

Morality as a Problem.--A defect in personality revenges itself everywhere: an enfeebled, lank, obliterated, self-disavowing and disowning personality is no longer fit for anything good--it is least of all fit for philosophy. "Selflessness" has no value either in heaven or on earth; the great problems all demand _great love,_ and it is only the strong, well-rounded, secure spirits, those who have a solid basis, that are qualified for them. It makes the most material difference whether a thinker stands personally related to his problems, having his fate, his need, and even his highest happiness therein; or merely impersonally, that is to say, if he can only feel and grasp them with the tentacles of cold, prying thought. In the latter case I warrant that nothing comes of it: for the great problems, granting that they let themselves be grasped at all, do not let themselves be _held_ by toads and weaklings: that has ever been their taste--a taste also which they share with all high-spirited women.--How is it that I have not yet met with any one, not even in books, who seems to have stood to morality in this position, as one who knew morality as a problem, and this problem as _his own_ personal need, affliction, pleasure and passion? It is obvious that up to the present morality has not been a problem at all; it has rather been the very ground on which people have met after all distrust, dissension and contradiction, the hallowed place of peace, where thinkers could obtain rest even from themselves, could recover breath and revive. I see no one who has ventured to _criticise_ the estimates of moral worth. I miss in this connection even the attempts of scientific curiosity, and the fastidious, groping imagination of psychologists and historians, which easily anticipates a problem and catches it on the wing, without rightly knowing what it catches. With difficulty I have discovered some scanty data for the purpose of furnishing a _history of the origin_ of these feelings and estimates of value (which is something different from a criticism of them, and also something different from a history of ethical systems). In an individual case I have done everything to encourage the inclination and talent for this kind of history--in vain, as it would seem to me at present. There is little to be learned from those historians of morality (especially Englishmen): they themselves are usually, quite unsuspiciously, under the influence of a definite morality, and act unwittingly as its armour-bearers and followers--perhaps still repeating sincerely the popular superstition of Christian Europe, that the characteristic of moral action consists in abnegation, self-denial, self-sacrifice, or in fellow-feeling and fellow-suffering. The usual error in their premises is their insistence on a certain _consensus_ among human beings, at least among civilised human beings, with regard to certain propositions of morality, from thence they conclude that these propositions are absolutely binding even upon you and me; or reversely, they come to the conclusion that _no_ morality is binding, after the truth has dawned upon them that among different peoples moral valuations are _necessarily_ different: both of which conclusions are equally childish follies. The error of the more subtle amongst them is that they discover and criticise the probably foolish opinions of a people about its own morality, or the opinions of mankind about human morality generally (they treat accordingly of its origin, its religious sanctions, the superstition of free will, and such matters), and they think that just by so doing they have criticised the morality itself. But the worth of a precept, "Thou shalt," is fundamentally different from and independent of such opinions about it, and must be distinguished from the weeds of error with which it has perhaps been overgrown: just as the worth of a medicine to a sick person is altogether independent of the question whether he has a scientific opinion about medicine, or merely thinks about it as an old wife would do. A morality could even have grown _out of_ an error: but with this knowledge the problem of its worth would not even be touched.--Thus, no one hitherto has tested the _value_ of that most celebrated of all medicines, called morality: for which purpose it is first of all necessary for one--_to call it in question._ Well, that is just our work.--

346.

Our Note of Interrogation.--But you don't understand it? As a matter of fact, an effort will be necessary in order to understand us. We seek for words; we seek perhaps also for ears. Who are we after all? If we wanted simply to call ourselves in older phraseology, atheists, unbelievers, or even immoralists, we should still be far from thinking ourselves designated thereby: we are all three in too late a phase for people generally to conceive, for _you,_ my inquisitive friends, to be able to conceive, what is our state of mind under the circumstances. No! we have no longer the bitterness and passion of him who has broken loose, who has to make for himself a belief, a goal, and even a martyrdom out of his unbelief! We have become saturated with the conviction (and have grown cold and hard in it) that things are not at all divinely ordered in this world, nor even according to human standards do they go on rationally, mercifully, or justly: we know the fact that the world in which we live is ungodly, immoral, and "inhuman,"--we have far too long interpreted it to ourselves falsely and mendaciously, according to the wish and will of our veneration, that is to say, according to our _need._ For man is a venerating animal! But he is also a distrustful animal: and that the world is _not_ worth what we

believed it to be worth is about the surest thing our distrust has at last managed to grasp. So much distrust, so much philosophy! We take good care not to say that the world is of _less_ value: it seems to us at present absolutely ridiculous when man claims to devise values _to surpass_ the values of the actual world,--it is precisely from that point that we have retraced our steps; as from an extravagant error of human conceit and irrationality, which for a long period has not been recognised as such. This error had its last expression in modern Pessimism; an older and stronger manifestation in the teaching of Buddha; but Christianity also contains it, more dubiously, to be sure, and more ambiguously, but none the less seductive on that account. The whole attitude of "man _versus_ the world," man as world-denying principle, man as the standard of the value of things, as judge of the world, who in the end puts existence itself on his scales and finds it too light--the monstrous impertinence of this attitude has dawned upon us as such, and has disgusted us,--we now laugh when we find, "Man _and_ World" placed beside one another, separated by the sublime presumption of the little word "and"! But how is it? Have we not in our very laughing just made a further step in despising mankind? And consequently also in Pessimism, in despising the existence cognisable _by us?_ Have we not just thereby awakened suspicion that there is an opposition between the world in which we have hitherto been at home with our venerations--for the sake of which we perhaps _endure_ life--and another world _which we ourselves are:_ an inexorable, radical, most profound suspicion concerning ourselves, which is continually getting us Europeans more annoyingly into its power, and could easily face the coming generation with the terrible alternative: Either do away with your venerations, or--_with yourselves!"_ The latter would be Nihilism--but would not the former also be Nihilism? This is _our_ note of interrogation.

347.

Believers and their Need of Belief.--How much _faith_ a person requires in order to flourish, how much "fixed opinion" he requires which he does not wish to have shaken, because he _holds_ himself thereby--is a measure of his power (or more plainly speaking, of his weakness). Most people in old Europe, as it seems to me, still need Christianity at present, and on that account it still finds belief. For such is man: a theological dogma might be refuted to him a thousand times,--provided, however, that he had need of it, he would again and again accept it as "true,"--according to the famous "proof of power" of which the Bible speaks. Some have still need of metaphysics; but also the impatient _longing for certainty_ which at present discharges itself in scientific, positivist fashion among large numbers of the people, the longing by all means to get at something stable (while on account of the warmth of the longing the establishing of the certainty is more leisurely and negligently undertaken):--even this is still the longing for a hold, a support; in short, the _instinct of weakness,_ which, while not actually creating religions, metaphysics, and convictions of all kinds, nevertheless--preserves them. In fact, around all these positivist systems there fume the vapours of a certain pessimistic gloom, something of weariness, fatalism, disillusionment, and fear of new disillusionment--or else manifest animosity, ill-humour, anarchic exasperation, and whatever there is of symptom or masquerade of the feeling of weakness. Even the readiness with which our cleverest contemporaries get lost in wretched corners and alleys, for example, in Vaterländerei (so I designate Jingoism, called _chauvinisme_ in France, and "_deutsch_" in Germany), or in petty æsthetic creeds in the manner of Parisian _naturalisme_ (which only brings into prominence and uncovers--_that_ aspect of nature which excites simultaneously disgust and astonishment--they like at present to call this aspect _la vérité vraie_, or in Nihilism in the St Petersburg style (that is to say, in the _belief in unbelief,_ even to martyrdom for it):--this shows always and above all the need of belief, support, backbone, and buttress.... Belief is always most desired, most pressingly needed, where there is a lack of will: for the will, as emotion of command, is the distinguishing characteristic of sovereignty and power. That is to say, the less a person knows how to command, the more urgent is his desire for that; which commands, and commands sternly,--a God, a prince, a caste, a physician, a confessor, a dogma, a party conscience. From whence perhaps it could be inferred that the two world-religions, Buddhism and Christianity, might well have had the cause of their rise, and especially of their rapid extension, in an extraordinary _malady of the will_ And in truth it has been so: both religions lighted upon a longing, monstrously exaggerated by malady of the will, for an imperative, a "Thou-shalt," a longing going the length of despair; both religions were teachers of fanaticism in times of slackness of will-power, and thereby offered to innumerable persons a support, a new possibility of exercising will, an enjoyment in willing. For in fact fanaticism is the sole "volitional strength" to which the weak and irresolute can be excited, as a sort of hypnotising of the entire sensory-intellectual system, in favour of the over-abundant nutrition (hypertrophy) of a particular point of view and a particular sentiment, which then dominates--the Christian calls it his _faith._ When a man arrives at the fundamental conviction that he _requires_ to be commanded, he becomes "a believer." Reversely, one could imagine a delight and a power of self-determining, and a _freedom_ of will, whereby a spirit could bid farewell to every belief, to every wish for certainty, accustomed as it would be to support itself on slender cords and possibilities, and to dance even on the verge of abysses. Such a spirit would be the _free spirit par excellence._

348.

The Origin of the Learned.--The learned man in Europe grows out of all the different ranks and social conditions, like a plant requiring no specific soil: on that account he belongs essentially and involuntarily to the partisans of democratic thought. But this origin betrays itself. If one has trained one's glance to some extent to recognise in a learned book or scientific treatise the intellectual _idiosyncrasy_ of the learned man--all of them have such idiosyncrasy,--and if we take it by surprise, we shall almost always get a glimpse behind it of the "antecedent history" of the learned man and his family, especially of the nature of their callings and occupations. Where the feeling finds expression, "That is at last proved, I am now done with it," it is commonly the ancestor in the blood and instincts of the learned man that approves of the "accomplished work" in the nook from which he sees things;--the belief in the proof is only an indication of what has been looked upon for ages by a laborious family as "good work." Take an example: the sons of registrars and office-clerks of every kind, whose main task has always been to arrange a variety of material, distribute it in drawers, and systematise it generally, evince, when they become learned men, an inclination to regard a problem as almost solved when they have systematised it There are philosophers who are at bottom nothing but systematising brains--the formal part of the paternal occupation has become its essence to them. The talent for classifications, for tables of categories, betrays something; it is not for nothing that a person is the child of his parents. The son of an advocate will also have to be an advocate as investigator: he seeks as a first consideration, to carry the point in his case, as a second consideration, he perhaps seeks to be in the right. One recognises the sons of Protestant clergymen and schoolmasters by the naïve assurance with which as learned men they already assume their case to be proved, when it has but been presented by them staunchly and warmly: they are thoroughly accustomed to people _believing_ in them,--it belonged to their fathers' "trade"! A Jew, contrariwise, in accordance with his business surroundings and the past of his race, is least of all accustomed--to people believing him. Observe Jewish scholars with regard to this matter,--they all lay great stress on logic, that is to say, on _compelling_ assent by means of reasons; they know that they must conquer thereby, even when race and class antipathy is against them, even where people are unwilling to believe them. For in fact, nothing is more democratic than logic: it knows no respect of persons, and takes even the crooked nose as straight. (In passing we may remark that in respect to logical thinking, in respect to _cleaner_ intellectual habits, Europe is not a little indebted to the Jews; above all the Germans, as being a lamentably _déraisonnable_ race, who, even at the present day, must always have their "heads washed"[1] in the first place. Wherever the Jews have attained to influence, they have taught to analyse more subtly, to argue more acutely, to write more clearly and purely: it has always been their problem to bring a people "to _raison._")

[1] In German the expression _Kopf zu waschen,_ besides the literal sense, also means "to give a person a sound drubbing."--TR.

349.

The Origin of the Learned once more.--To seek self-preservation merely, is the expression of a state of distress, or of limitation of the true, fundamental instinct of life, which aims at the _extension of power,_ and with this in view often enough calls in question self-preservation and sacrifices it. It should be taken as symptomatic when individual philosophers, as for example, the consumptive Spinoza, have seen and have been obliged to see the principal feature of life precisely in the so-called self-preservative instinct:--they have just been men in states of distress. That our modern natural sciences have entangled themselves so much with Spinoza's dogma (finally and most grossly in Darwinism, with its inconceivably one-sided doctrine of the "struggle for existence"--), is probably owing to the origin of most of the inquirers into nature: they belong in this respect to the people, their forefathers have been poor and humble persons, who knew too well by immediate experience the difficulty of making a living. Over the whole of English Darwinism there hovers something of the suffocating air of over-crowded England, something of the odour of humble people in need and in straits. But as an investigator of nature, a person ought to emerge from his paltry human nook: and in nature the state of distress does not _prevail,_ but superfluity, even prodigality to the extent of folly. The struggle for existence is only an _exception,_ a temporary restriction of the will to live; the struggle, be it great or small, turns everywhere on predominance, on increase and expansion, on power, in conformity to the will to power, which is just the will to live.

350.

In Honour of Homines Religiosi.--The struggle against the church is certainly (among other things--for it has a manifold significance) the struggle of the more ordinary, cheerful, confiding, superficial natures against the rule of the graver, profounder, more contemplative natures, that is to say, the more malign and suspicious men, who with long continued distrust in the worth of life, brood also over their own worth:--the ordinary instinct of the people, its sensual gaiety, its "good heart," revolts against them. The entire Roman Church rests on a Southern suspicion of the nature of man (always misunderstood in the North), a suspicion whereby the European South has succeeded, to the inheritance of the profound Orient--the mysterious, venerable Asia--and its

contemplative spirit. Protestantism was a popular insurrection in favour of the simple, the respectable, the superficial (the North has always been more good-natured and more shallow than the South), but it was the French Revolution that first gave the sceptre wholly and solemnly into the hands of the "good man" (the sheep, the ass, the goose, and everything incurably shallow, bawling, and fit for the Bedlam of "modern ideas").

351.

In Honour of Priestly Natures.--I think that philosophers have always felt themselves very remote from that which the people (in all classes of society nowadays) take for wisdom: the prudent, bovine placidity, piety, and country-parson meekness, which lies in the meadow and _gazes at_ life seriously and ruminatingly:--this is probably because philosophers have not had sufficiently the taste of the "people," or of the country-parson, for that kind of wisdom. Philosophers will also perhaps be the last to acknowledge that the people _should_ understand something of that which lies furthest from them, something of the great _passion_ of the thinker, who lives and must live continually in the storm-cloud of the highest problems and the heaviest responsibilities (consequently, not gazing at all, to say nothing of doing so indifferently, securely, objectively). The people venerate an entirely different type of men when on their part they form the ideal of a "sage," and they are a thousand times justified in rendering homage with the highest eulogies and honours to precisely that type of men--namely, the gentle, serious, simple, chaste, priestly natures and those related to them,--it is to them that the praise falls due in the popular veneration of wisdom. And to whom should the multitude have more reason to be grateful than to these men who pertain to its class and rise from its ranks, but are persons consecrated, chosen, and _sacrificed_ for its good--they themselves believe themselves sacrificed to God,--before whom every one can pour forth his heart with impunity, by whom he can _get rid_ of his secrets, cares, and worse things (for the man who "communicates himself" gets rid of himself, and he who has "confessed" forgets). Here there exists a great need: for sewers and pure cleansing waters are required also for spiritual filth, and rapid currents of love are needed, and strong, lowly, pure hearts, who qualify and sacrifice themselves for such service of the non-public health-department--for it _is_ a sacrificing, the priest is, and continues to be, a human sacrifice.... The people regard such sacrificed, silent, serious men of "faith" as "_wise,"_ that is to say, as men who have become sages, as "reliable" in relation to their own unreliability. Who would desire to deprive the people of that expression and that veneration?--But as is fair on the other side, among philosophers the priest also is still held to belong to the "people," and is _not_ regarded as a sage, because, above all, they themselves do not believe in "sages," and they already scent "the people" in this very belief and superstition. It was _modesty_ which invented in Greece the word "philosopher," and left to the play-actors of the spirit the superb arrogance of assuming the name "wise"--the modesty of such monsters of pride and self-glorification as Pythagoras and Plato.--

352.

_Why we can hardly Dispense with Morality.--_The naked man is generally an ignominious spectacle--I speak of us European males (and by no means of European females!). If the most joyous company at table suddenly found themselves stripped and divested of their garments through the trick of an enchanter, I believe that not only would the joyousness be gone and the strongest appetite lost;--it seems that we Europeans cannot at all dispense with the masquerade that is called clothing. But should not the disguise of "moral men," the screening under moral formulæ and notions of decency, the whole kindly concealment of our conduct under conceptions of duty, virtue, public sentiment, honourableness, and disinterestedness, have just as good reasons in support of it? Not that I mean hereby that human wickedness and baseness, in short, the evil wild beast in us, should be disguised; on the contrary, my idea is that it is precisely as _tame animals_ that we are an ignominious spectacle and require moral disguising,--that the "inner man" in Europe is far from having enough of intrinsic evil "to let himself be seen" with it (to be _beautiful_ with it). The European disguises himself _in morality_ because he has become a sick, sickly, crippled animal, who has good reasons for being "tame," because he is almost an abortion, an imperfect, weak and clumsy thing.... It is not the fierceness of the beast of prey that finds moral disguise necessary, but the gregarious animal, with its profound mediocrity, anxiety and ennui. _Morality dresses up the European_--let us acknowledge it!--in more distinguished, more important, more conspicuous guise--in "divine" guise--

353.

The Origin of Religions.--The real inventions of founders of religions are, on the one hand, to establish a definite mode of life and everyday custom, which operates as _disciplina voluntatis,_ and at the same time does away with ennui; and on the other hand, to give to that very mode of life an _interpretation,_ by virtue of which it appears illumined with the highest value; so that it henceforth becomes a good for which people struggle, and under certain circumstances lay down their lives. In truth, the second of these

inventions is the more essential: the first, the mode of life, has usually been there already, side by side, however, with other modes of life, and still unconscious of the value which it embodies. The import, the originality of the founder of a religion, discloses itself usually in the fact that he _sees_ the mode of life, _selects_ it, and _divines_ for the first time the purpose for which it can be used, how it can be interpreted. Jesus (or Paul) for example, found around him the life of the common people in the Roman province, a modest, virtuous, oppressed life: he interpreted it, he put the highest significance and value into it--and thereby the courage to despise every other mode of life, the calm fanaticism of the Moravians, the secret, subterranean self-confidence which goes on increasing, and is at last ready "to overcome the world" (that is to say, Rome, and the upper classes throughout the empire). Buddha, in like manner, found the same type of man,--he found it in fact dispersed among all the classes and social ranks of a people who were good and kind (and above all inoffensive), owing to indolence, and who likewise owing to indolence, lived abstemiously, almost without requirements. He understood that such a type of man, with all its _vis inertiæ,_ had inevitably to glide into a belief which promises _to avoid_ the return of earthly ill (that is to say, labour and activity generally),--this "understanding" was his genius. The founder of a religion possesses psychological infallibility in the knowledge of a definite, average type of souls, who have not yet _recognised_ themselves as akin. It is he who brings them together: the founding of a religion, therefore, always becomes a long ceremony of recognition.--

354.

The "Genius of the Species."--The problem of consciousness (or more correctly: of becoming conscious of oneself) meets us only when we begin to perceive in what measure we could dispense with it: and it is at the beginning of this perception that we are now placed by physiology and zoology (which have thus required two centuries to overtake the hint thrown out in advance by Leibnitz). For we could in fact think, feel, will, and recollect, we could likewise "act" in every sense of the term, and nevertheless nothing of it all need necessarily "come into consciousness" (as one says metaphorically). The whole of life would be possible without its seeing itself as it were in a mirror: as in fact even at present the far greater part of our life still goes on without this mirroring,--and even our thinking, feeling, volitional life as well, however painful this statement may sound to an older philosopher. _What_ then is _the purpose_ of consciousness generally, when it is in the main _superfluous_?--Now it seems to me, if you will hear my answer and its perhaps extravagant supposition, that the subtlety and strength of consciousness are always in proportion to the _capacity for communication_ of a man (or an animal), the capacity for communication in its turn being in proportion to the _necessity for communication:_ the latter not to be understood as if precisely the individual himself who is master in the art of communicating and making known his necessities would at the same time have to be most dependent upon others for his necessities. It seems to me, however, to be so in relation to whole races and successions of generations: where necessity and need have long compelled men to communicate with their fellows and understand one another rapidly and subtly, a surplus of the power and art of communication is at last acquired as if it were a fortune which had gradually accumulated, and now waited for an heir to squander it prodigally (the so-called artists are these heirs, in like manner the orators, preachers, and authors: all of them men who come at the end of a long succession, "late-born" always, in the best sense of the word, and as has been said, _squanderers_ by their very nature). Granted that this observation is correct, I may proceed further to the conjecture that _consciousness generally has only been developed under the pressure of the necessity for communication,_--that from the first it has been necessary and useful only between man and man (especially between those commanding and those obeying) and has only developed in proportion to its utility Consciousness is properly only a connecting network between man and man,--it is only as such that it has had to develop; the recluse and wild-beast species of men would not have needed it The very fact that our actions, thoughts, feelings and motions come within the range of our consciousness--at least a part of them--is the result of a terrible, prolonged "must" ruling man's destiny: as the most endangered animal he _needed_ help and protection; he needed his fellows, he was obliged to express his distress, he had to know how to make himself understood--and for all this he needed "consciousness" first of all: he had to "know" himself what he lacked, to "know" how he felt, and to "know" what he thought. For, to repeat it once more, man, like every living creature, thinks unceasingly, but does not know it; the thinking which is becoming _conscious of itself_ is only the smallest part thereof, we may say, the most superficial part, the worst part:--for this conscious thinking alone _is done in words, that is to say, in the symbols for communication,_ by means of which the origin of consciousness is revealed. In short, the development of speech and the development of consciousness (not of reason, but of reason becoming self-conscious) go hand in hand. Let it be further accepted that it is not only speech that serves as a bridge between man and man, but also the looks, the pressure and the gestures; our becoming conscious of our sense impressions, our power of being able to fix them, and as it were to locate them outside of ourselves, has increased in proportion as the necessity has increased for communicating them to _others_ by means of signs. The sign-inventing man is at the same time the man who is always more acutely self-conscious; it is only as a social animal that man has learned to become conscious of himself,--he is doing so still, and doing so more and more.--As is

obvious, my idea is that consciousness does not properly belong to the individual existence of man, but rather to the social and gregarious nature in him; that, as follows therefrom, it is only in relation to communal and gregarious utility that it is finely developed; and that consequently each of us, in spite of the best intention of _understanding_ himself as individually as possible, and of "knowing himself," will always just call into consciousness the non-individual in him, namely, his "averageness"; --that our thought itself is continuously as it were _outvoted_ by the character of consciousness--by the imperious "genius of the species" therein--and is translated back into the perspective of the herd. Fundamentally our actions are in an incomparable manner altogether personal, unique and absolutely individual--there is no doubt about it; but as soon as we translate them into consciousness, they _do not appear so any longer ..._. This is the proper phenomenalism and perspectivism as I understand it: the nature of _animal consciousness_ involves the notion that the world of which we can become conscious is only a superficial and symbolic world, a generalised and vulgarised world;--that everything which becomes conscious _becomes_ just thereby shallow, meagre, relatively stupid,--a generalisation, a symbol, a characteristic of the herd; that with the evolving of consciousness there is always combined a great, radical perversion, falsification, superficialisation, and generalisation. Finally, the growing consciousness is a danger, and whoever lives among the most conscious Europeans knows even that it is a disease. As may be conjectured, it is not the antithesis of subject and object with which I am here concerned: I leave that distinction to the epistemologists who have remained entangled in the toils of grammar (popular metaphysics). It is still less the antithesis of "thing in itself" and phenomenon, for we do not "know" enough to be entitled even _to make such a distinction._ Indeed, we have not any organ at all for _knowing,_ or for "truth": we "know" (or believe, or fancy) just as much as may be _of use_ in the interest of the human herd, the species; and even what is here called "usefulness" is ultimately only a belief, a fancy, and perhaps precisely the most fatal stupidity by which we shall one day be ruined.

355.

The Origin of our Conception of "Knowledge"--I take this explanation from the street. I heard one of the people saying that "he knew me," so I asked myself: What do the people really understand by knowledge? what do they want when they seek "knowledge"? Nothing more than that what is strange is to be traced back to something _known._ And we philosophers--have we really understood _anything more_ by knowledge? The known, that is to say, what we are accustomed to so that we no longer marvel at it, the commonplace, any kind of rule to which we are habituated, all and everything in which we know ourselves to be at home:--what? is our need of knowing not just this need of the known? the will to discover in everything strange, unusual, or questionable, something which no longer disquiets us? Is it not possible that it should be the _instinct of fear_ which enjoins upon us to know? Is it not possible that the rejoicing of the discerner should be just his rejoicing in the regained feeling of security?... One philosopher imagined the world "known" when he had traced it back to the "idea": alas, was it not because the idea was so known, so familiar to him? because he had so much less fear of the "idea"--Oh, this moderation of the discerners! let us but look at their principles, and at their solutions of the riddle of the world in this connection! When they again find aught in things, among things, or behind things that is unfortunately very well known to us, for example, our multiplication table, or our logic, or our willing and desiring, how happy they immediately are! For "what is known is understood": they are unanimous as to that. Even the most circumspect among them think that the known is at least _more easily understood_ than the strange; that for example, it is methodically ordered to proceed outward from the "inner world," from "the facts of consciousness," because it is the world which is _better known to us!_ Error of errors! The known is the accustomed, and the accustomed is the most difficult of all to "understand," that is to say, to perceive as a problem, to perceive as strange, distant, "outside of us."... The great certainty of the natural sciences in comparison with psychology and the criticism of the elements of consciousness--_unnatural_ sciences, as one might almost be entitled to call them--rests precisely on the fact that they take _what is strange_ as their object: while it is almost like something contradictory and absurd _to wish_ to take generally what is not strange as an object....

356.

In what Manner Europe will always become "more Artistic."--Providing a living still enforces even in the present day (in our transition period when so much ceases to enforce) a definite _rôle_ on almost all male Europeans, their so-called callings; some have the liberty, an apparent liberty, to choose this rôle themselves, but most have it chosen for them. The result is strange enough. Almost all Europeans confound themselves with their rôle when they advance in age; they themselves are the victims of their "good acting," they have forgotten how much chance, whim and arbitrariness swayed them when their "calling" was decided--and how many other rôles they _could_ perhaps have played: for it is now too late! Looked at more closely, we see that their characters have actually _evolved_ out of their rôle, nature out of art. There were ages in which people believed with unshaken confidence, yea, with piety, in their predestination for this very business, for that very mode of livelihood, and would not

at all acknowledge chance, or the fortuitous rôle, or arbitrariness therein. Ranks, guilds, and hereditary trade privileges succeeded] with the help of this belief, in rearing those extraordinary broad towers of society which distinguished the Middle Ages, and of which at all events one thing remains to their credit: capacity for duration (and duration is a thing of the first rank on earth!). But there are ages entirely the reverse, the properly democratic ages, in which people tend to become more and more oblivious of this belief, and a sort of impudent conviction and quite contrary mode of viewing things comes to the front, the Athenian conviction which is first observed in the epoch of Pericles, the American conviction of the present day, which wants also more and more to become a European conviction: whereby the individual is convinced that he can do almost anything, that he _can play almost any rôle,_ whereby everyone makes experiments with himself, improvises, tries anew, tries with delight, whereby all nature ceases and becomes art.... The Greeks, having adopted this _rôle-creed--_--an artist creed, if you will--underwent step by step, as is well known, a curious transformation, not in every respect worthy of imitation: _they became actual stage-players;_ and as such they enchanted, they conquered all the world, and at last even the conqueror of the world, (for the _Græculus histrio_ conquered Rome, and _not_ Greek culture, as the naïve are accustomed to say...). What I fear, however, and what is at present obvious, if we desire to perceive it, is that we modern men are quite on the same road already; and whenever a man begins to discover in what respect he plays a rôle, and to what extent he _can_ be a stage-player, he _becomes_ a stage-player.... A new flora and fauna of men thereupon springs up, which cannot grow in more stable, more restricted eras--or is left "at the bottom," under the ban and suspicion of infamy; thereupon the most interesting and insane periods of history always make their appearance, in which "stage-players," _all_ kinds of stage-players, are the real masters. Precisely thereby another species of man is always more and more injured, and in the end made impossible: above all the great "architects"; the building power is now being paralysed; the courage that makes plans for the distant future is disheartened; there begins to be a lack of organising geniuses. Who is there who would now venture to undertake works for the completion of which millenniums would have to be _reckoned_ upon? The fundamental belief is dying out, on the basis of which one could calculate, promise and anticipate the future in one's plan, and offer it as a sacrifice thereto, that in fact man has only value and significance in so far as he is _a stone in a great building;_ for which purpose he has first of all to be _solid,_ he has to be a "stone."... Above all, not a--stage-player! In short--alas! this fact will be hushed up for some considerable time to come!--that which from henceforth will no longer be built, and _can_ no longer be built, is--a society in the old sense of the term; to build that structure everything is lacking, above all, the material. _None of us are any longer material for a society:_ that is a truth which is seasonable at present! It seems to me a matter of indifference that meanwhile the most short-sighted, perhaps the most honest, and at any rate the noisiest species of men of the present day, our friends the Socialists, believe, hope, dream, and above all scream and scribble almost the opposite; in fact one already reads their watchword of the future-: "free society," on all tables and walls. Free society? Indeed! Indeed! But you know, gentlemen, sure enough whereof one builds it? Out of wooden iron! Out of the famous wooden iron! And not even out of wooden....

357.

The old Problem: "What is German?"--Let us count up apart the real acquisitions of philosophical thought for which we have to thank German intellects: are they in any allowable sense to be counted also to the credit of the whole race? Can we say that they are at the same time the work of the "German soul," or at least a symptom of it, in the sense in which we are accustomed to think, for example, of Plato's ideomania, his almost religious madness for form, as an event and an evidence of the "Greek soul"? Or would the reverse perhaps be true? Were they individually as much _exceptions_ to the spirit of the race, as was, for example, Goethe's Paganism with a good conscience? Or as Bismarck's Macchiavelism was with a good conscience, his so-called "practical politics" in Germany? Did our philosophers perhaps even go counter to the _need_ of the "German soul"? In short, were the German philosophers really philosophical _Germans_?--I call to mind three cases. Firstly, _Leibnitz's_ incomparable insight--with which he obtained the advantage not only over Descartes, but over all who had philosophised up to his time,--that consciousness is only an accident of mental representation, and _not_ its necessary and essential attribute; that consequently what we call consciousness only constitutes a state of our spiritual and psychical world (perhaps a morbid state), and is _far from being that world itself_:--is there anything German in this thought, the profundity of which has not as yet been exhausted? Is there reason to think that a person of the Latin race would not readily have stumbled on this reversal of the apparent?--for it is a reversal. Let us call to mind secondly, the immense note of interrogation which _Kant_ wrote after the notion of causality. Not that he at all doubted its legitimacy, like Hume: on the contrary, he began cautiously to define the domain within which this notion has significance generally (we have not even yet got finished with the marking out of these limits). Let us take thirdly, the astonishing hit of _Hegel,_ who stuck at no logical usage or fastidiousness when he ventured to teach that the conceptions of kinds develop _out of one another:_ with which theory the thinkers in Europe were prepared for the last great scientific movement, for Darwinism--for without Hegel there would have been no Darwin. Is there anything German in this Hegelian innovation which first introduced the decisive

conception of evolution into science?--Yes, without doubt we feel that there is something of ourselves "discovered" and divined in all three cases; we are thankful for it, and at the same time surprised; each of these three principles is a thoughtful piece of German self-confession, self-understanding, and self-knowledge. We feel with Leibnitz that "our inner world is far richer, ampler, and more concealed"; as Germans we are doubtful, like Kant, about the ultimate validity of scientific knowledge of nature, and in general about whatever _can_ be known _causaliter:_ the _knowable_ as such now appears to us of _less_ worth. We Germans should still have been Hegelians, even though there had never been a Hegel, inasmuch as we (in contradistinction to all Latin peoples) instinctively attribute to becoming, to evolution, a profounder significance and higher value than to that which "is"--we hardly believe at all in the validity of the concept "being." This is all the more the case because we are not inclined to concede to our human logic that it is logic in itself, that it is the only kind of logic (we should rather like, on the contrary, to convince ourselves that it is only a special case, and perhaps one of the strangest and most stupid).--A fourth question would be whether also _Schopenhauer_ with his Pessimism, that is to say, the problem of _the worth of existence,_ had to be a German. I think not. The event _after_ which this problem was to be expected with certainty, so that an astronomer of the soul could have calculated the day and the hour for it--namely, the decay of the belief in the Christian God, the victory of scientific atheism,--is a universal European event, in which all races are to have their share of service and honour. On the contrary, it has to be ascribed precisely to the Germans--those with whom Schopenhauer was contemporary,--that they delayed this victory of atheism longest, and endangered it most. Hegel especially was its retarder _par excellence,_ in virtue of the grandiose attempt which he made to persuade us at the very last of the divinity of existence, with the help of our sixth sense, "the historical sense." As philosopher, Schopenhauer was the _first_ avowed and inflexible atheist we Germans have had: his hostility to Hegel had here its motive. The non-divinity of existence was regarded by him as something understood, palpable, indisputable; he always lost his philosophical composure and got into a passion when he saw anyone hesitate and beat about the bush here. It is at this point that his thorough uprightness of character comes in: unconditional, honest atheism is precisely the _preliminary condition_ for his raising the problem, as a final and hardwon victory of the European conscience, as the most prolific act of two thousand years' discipline to truth, which in the end no longer tolerates the _lie_ of the belief in a God.... One sees what has really gained the victory over the Christian God--, Christian morality itself, the conception of veracity, taken ever more strictly, the confessional subtlety of the Christian conscience, translated and sublimated to the scientific conscience, to intellectual purity at any price. To look upon nature as if it were a proof of the goodness and care of a God; to interpret history in honour of a divine reason, as a constant testimony to a moral order in the world and a moral final purpose; to explain personal experiences as pious men have long enough explained them, as if everything were a dispensation or intimation of Providence, something planned and sent on behalf of the salvation of the soul: all that is now _past,_ it has conscience _against_ it, it is regarded by all the more acute consciences as disreputable and dishonourable, as mendaciousness, femininism, weakness, and cowardice,--by virtue of this severity, if by anything, we are _good_ Europeans, the heirs of Europe's longest and bravest self-conquest. When we thus reject the Christian interpretation, and condemn its "significance" as a forgery, we are immediately confronted in a striking manner with the _Schopenhauerian_ question: _Has existence then a significance at all?_--the question which will require a couple of centuries even to be completely heard in all its profundity. Schopenhauer's own answer to this question was--if I may be forgiven for saying so--a premature, juvenile reply, a mere compromise, a stoppage and sticking in the very same Christian-ascetic, moral perspectives, _the belief in which had got notice to quit_ along with the belief in God.... But he _raised_ the question--as a good European, as we have said, and _not_ as a German.--Or did the Germans prove at least by the way in which they seized on the Schopenhauerian question, their inner connection and relationship to him, their preparation for his problem, and their _need_ of it? That there has been thinking and printing even in Germany since Schopenhauer's time on the problem raised by him,--it was late enough!--does not at all suffice to enable us to decide in favour of this closer relationship; one could, on the contrary, lay great stress on the peculiar _awkwardness_ of this post-Schopenhauerian Pessimism--Germans evidently do not behave themselves here as in their element. I do not at all allude here to Eduard von Hartmann; on the contrary, my old suspicion is not vanished even at present that he is _too clever_ for us; I mean to say that as arrant rogue from the very first, he did not perhaps make merry solely over German Pessimism--and that in the end he might probably "bequeathe" to them the truth as to how far a person could bamboozle the Germans themselves in the age of bubble companies. But further, are we perhaps to reckon to the honour of Germans, the old humming-top, Bahnsen, who all his life spun about with the greatest pleasure around his realistically dialectic misery and "personal ill-luck,"--was _that_ German? (In passing I recommend his writings for the purpose for which I myself have used them, as anti-pessimistic fare, especially on account of his _elegantia psychologica,_ which, it seems to me, could alleviate even the most constipated body and soul). Or would it be proper to count such dilettanti and old maids as the mawkish apostle of virginity, Mainländer, among the genuine Germans? After all he was probably a Jew (all Jews become mawkish when they moralise). Neither Bahnsen, nor Mainländer, nor even Eduard von Hartmann, give us a reliable grasp of the question whether the pessimism of Schopenhauer (his frightened glance into an undeified

world, which has become stupid, blind, deranged and problematic, his _honourable_ fright) was not only an exceptional case among Germans, but a _German_ event: while everything else which stands in the foreground, like our valiant politics and our joyful Jingoism (which decidedly enough regards everything with reference to a principle sufficiently unphilosophical: _"Deutschland, Deutschland, über Alles"_[2] consequently _sub specie speciei,_ namely, the German _species_), testifies very plainly to the contrary. No! The Germans of to-day are _not_ pessimists! And Schopenhauer was a pessimist, I repeat it once more, as a good European, and _not_ as a German.

[2] "_Germany, Germany, above all_": the first line of the German national song.--TR.

358.

The Peasant Revolt of the Spirit.--We Europeans find ourselves in view of an immense world of ruins, where some things still tower aloft, while other objects stand mouldering and dismal, where most things however already lie on the ground, picturesque enough--where were there ever finer ruins?--overgrown with weeds, large and small. It is the Church which is this city of decay: we see the religious organisation of Christianity shaken to its deepest foundations. The belief in God is overthrown, the belief in the Christian ascetic ideal is now fighting its last fight. Such a long and solidly built work as Christianity--it was the last construction of the Romans!--could not of course be demolished..all at once; every sort of earthquake had to shake it, every sort of spirit which perforates, digs, gnaws and moulders had to assist in the work of destruction. But that which is strangest is that those who have exerted themselves most to retain and preserve Christianity, have been precisely those who did most to destroy it,--the Germans. It seems that the Germans do not understand the essence of a Church. Are they not spiritual enough, or not distrustful enough to do so? In any case the structure of the Church rests on a _southern_ freedom and liberality of spirit, and similarly on a southern suspicion of nature, man, and spirit,--it rests on a knowledge of man an experience of man, entirely different from what the north has had. The Lutheran Reformation in all its length and breadth was the indignation of the simple against something "complicated." To speak cautiously, it was a coarse, honest misunderstanding, in which much is to be forgiven,--people did not understand the mode of expression of a _victorious_ Church, and only saw corruption; they misunderstood the noble scepticism, the _luxury_ of scepticism and toleration which every victorious, self-confident power permits.... One overlooks the fact readily enough at present that as regards all cardinal questions concerning power Luther was badly endowed; he was fatally short-sighted, superficial and imprudent--and above all, as a man sprung from the people, he lacked all the hereditary qualities of a ruling caste, and all the instincts for power; so that his work, his intention to restore the work of the Romans, merely became involuntarily and unconsciously the commencement of a work of destruction. He unravelled, he tore asunder with honest rage, where the old spider had woven longest and most carefully. He gave the sacred books into the hands of everyone,--they thereby got at last into the hands of the philologists, that is to say, the annihilators of every belief based upon books. He demolished the conception of "the Church" in that he repudiated the belief in the inspiration of the Councils: for only under the supposition that the inspiring spirit which had founded the Church still lives in it, still builds it, still goes on building its house, does the conception of "the Church" retain its power. He gave back to the priest sexual intercourse: but three-fourths of the reverence of which the people (and above all the women of the people) are capable, rests on the belief that an exceptional man in this respect will also be an exceptional man in other respects. It is precisely here that the popular belief in something superhuman in man, in a miracle, in the saving God in man, has its most subtle and insidious advocate. After Luther had given a wife to the priest, he had _to take from him_ auricular confession; that was psychologically right: but thereby he practically did away with the Christian priest himself, whose profoundest utility has ever consisted I in his being a sacred ear, a silent well, and a grave for secrets. "Every man his own priest"--behind such formulæ and their bucolic slyness, there was concealed in Luther the profoundest hatred of "higher men," and of the rule of "higher men," as the Church had conceived them. Luther disowned an ideal which he did not know how to attain, while he seemed to combat and detest the degeneration thereof. As a matter of fact, he, the impossible monk, repudiated the _rule_ of the _homines religiosi_; he consequently brought about precisely the same thing within the ecclesiastical social order that he combated so impatiently in the civic order,--namely a "peasant insurrection."--As to all that grew out of his Reformation afterwards, good and bad, which can at present be almost counted up--who would be naïve enough to praise or blame Luther simply on account of these results? He is innocent of all; he knew not what he did. The art of making the European spirit shallower especially in the north, or more _good-natured,_ if people would rather hear it designated by a moral expression, undoubtedly took a clever step in advance in the Lutheran Reformation; and similarly there grew out of it the mobility and disquietude of the spirit, its thirst for independence, its belief in the right to freedom, and its "naturalness." If people wish to ascribe to the Reformation in the last instance the merit of having prepared and favoured that which we at present honour as "modern science," they must of course add that it is also accessory to bringing about the degeneration of the modern scholar, with his lack of reverence, of shame and of profundity; and

that it is also responsible for all naïve candour and plain-dealing in matters of knowledge, in short for the _plebeianism of the spirit_ which is peculiar to the last two centuries, and from which even pessimism hitherto, has not in any way delivered us. "Modern ideas" also belong to this peasant insurrection of the north against the colder, more ambiguous, more suspicious spirit of the south, which has built itself its greatest monument in the Christian Church. Let us not forget in the end what a Church is, and especially in contrast to every "State": a Church is above all an authoritative organisation which secures to the _most spiritual_ men the highest rank, and _believes_ in the power of spirituality so far as to forbid all grosser appliances of authority. Through this alone the Church is under all circumstances a _nobler_ institution than the State.--

359.

Vengeance on Intellect, and other Backgrounds of Morality.--Morality--where do you think it has its most dangerous and rancorous advocates?--There, for example, is an ill-constituted man, who does not possess enough of intellect to be able to take pleasure in it, and just enough of culture to be aware of the fact; bored, satiated, and a self-despiser; besides being cheated unfortunately by some hereditary property out of the last consolation, the "blessing of labour," the self-forgetfulness in the "day's work "; one who is thoroughly ashamed of his existence--perhaps also harbouring some vices,--and who on the other hand (by means of books to which he has no right, or more intellectual society than he can digest), cannot help vitiating himself more and more, and making himself vain and irritable: such a thoroughly poisoned man--for intellect becomes poison, culture becomes poison, possession becomes poison, solitude becomes poison, to such ill-constituted beings--gets at last into a habitual state of vengeance and inclination for vengeance.... What do you think he finds necessary, absolutely necessary in order to give himself the appearance in his own eyes of superiority over more intellectual men, so as to give himself the delight of _perfect revenge,_ at least in imagination? It is always _morality_ that he requires, one may wager on it; always the big moral words, always the high-sounding words: justice, wisdom, holiness, virtue; always the Stoicism of gestures (how well Stoicism hides what one does _not_ possess!); always the mantle of wise silence, of affability, of gentleness, and whatever else the idealist-mantle is called, in which the incurable self-despisers and also the incurably conceited walk about. Let me not be misunderstood: out of such born _enemies of the spirit_ there arises now and then the rare specimen of humanity who is honoured by the people under the name of saint or sage: it is out of such men that there arise those prodigies of morality that make a noise, and make history,--St Augustine was one of these men. Fear of the intellect, vengeance on the intellect--Oh! how often have these powerfully impelling vices become the root of virtues! Yea, virtue _itself!_--And asking the question among ourselves, even the philosopher's pretension to wisdom, which has occasionally been made here and there on the earth, the maddest and most immodest of all pretensions,--has it not always been _above all_ in India as well as in Greece, _a means of concealment?_ Sometimes, perhaps, from the point of view of education which hallows so many lies, it is a tender regard for growing and evolving persons, for disciples who have often to be guarded against themselves by means of the belief in a person (by means of an error). In most cases, however, it is a means of concealment for a philosopher, behind which he seeks protection, owing to exhaustion, age, chilliness, or hardening; as a feeling of the approaching end, as the sagacity of the instinct which animals have before their death,--they go apart, remain at rest, choose solitude, creep into caves, become _wise_.... What? Wisdom a means of concealment of the philosopher from--intellect?--

360.

Two Kinds of Causes which are Confounded.--It seems to me one of my most essential steps and advances that I have learned to distinguish the cause of an action generally from the cause of an action in a particular manner, say, in this direction, with this aim. The first kind of cause is a quantum of stored-up force, which waits to be used in some manner, for some purpose; the second kind of cause, on the contrary, is something quite unimportant in comparison with the first, an insignificant hazard for the most part, in conformity with which the quantum of force in question "discharges" itself in some unique and definite manner: the lucifer-match in relation to the barrel of gunpowder. Among those insignificant hazards and lucifer-matches I count all the so-called "aims," and similarly the still more so-called "occupations" of people: they are relatively optional, arbitrary, and almost indifferent in relation to the immense quantum of force which presses on, as we have said, to be used up in any way whatever. One generally looks at the matter in a different manner: one is accustomed to see the _impelling_ force precisely in the aim (object, calling, &c.), according to a primeval error,--but it is only the _directing_ force; the steersman and the steam have thereby been confounded. And yet it is not even always a steersman, the directing force.... Is the "aim" the "purpose," not often enough only an extenuating pretext, an additional self-blinding of conceit, which does not wish it to be said that the ship _follows_ the stream into which it has accidentally run? That it "wishes" to go that way, _because_ it _must_ go that way? That it has a direction, sure enough, but--not a steersman? We still require a criticism of the conception of "purpose."

361.

The Problem of the Actor--The problem of the actor has disquieted me the longest; I was uncertain (and am sometimes so still) whether one could not get at the dangerous conception of "artist"--a conception hitherto treated with unpardonable leniency--from this point of view. Falsity with a good conscience; delight in dissimulation breaking forth as power, pushing aside, overflowing, and sometimes extinguishing the so-called "character"; the inner longing to play a rôle, to assume a mask, to put on an _appearance;_ a surplus of capacity for adaptations of every kind, which can no longer gratify themselves in the service of the nearest and narrowest utility: all that perhaps does not pertain _solely_ to the actor in himself?... Such an instinct would develop most readily in families of the lower class of the people, who have had to pass their lives in absolute dependence, under shifting pressure and constraint, who (to accommodate themselves to their conditions, to adapt themselves always to new circumstances) had again and again to pass themselves off and represent themselves as different persons,--thus having gradually qualified themselves to adjust the mantle to _every_ wind, thereby almost becoming the mantle itself, as masters of the embodied and incarnated art of eternally playing the game of hide and seek, which one calls _mimicry_ among the animals:--until at last this ability, stored up from generation to generation, has become domineering, irrational and intractable, till as instinct it begins to command the other instincts, and begets the actor and "artist" (the buffoon, the pantaloon, the Jack-Pudding, the fool, and the clown in the first place, also the classical type of servant, Gil Blas: for in such types one has the precursors of the artist, and often enough even of the "genius"). Also under higher social conditions there grows under similar pressure a similar species of men: only the histrionic instinct is there for the most part held strictly in check by another instinct, for example, among "diplomatists";--for the rest, I should think that it would always be open to a good diplomatist to become a good actor on the stage, provided his dignity "allowed" it. As regards the _Jews,_ however, the adaptable people _par excellence,_ we should, in conformity to this line of thought, expect to see among them a world-wide historical institution at the very first, for the rearing of actors, a proper breeding-place for actors; and in fact the question is very pertinent just now: what good actor at present is _not--_a Jew? The Jew also, as a born literary man, as the actual ruler of the European press, exercises this power on the basis of his histrionic capacity: for the literary man is essentially an actor,--he plays the part of "expert," of "specialist."--Finally _women._ If we consider the whole history of women, are they not _obliged_ first of all, and above all to be actresses? If we listen to doctors who have hypnotised women, or, finally, if we love them--and let ourselves be "hypnotised" by them--what is always divulged thereby? That they "give themselves airs," even when they--"give themselves." ... Woman is so artistic ...

362.

My Belief in the Virilising of Europe.--We owe it to Napoleon (and not at all to the French Revolution, which had in view the "fraternity" of the nations, and the florid interchange of good graces among people generally) that several warlike centuries, which have not had their like in past history, may now follow one another--in short, that we have entered upon _the classical age of war,_ war at the same time scientific and popular, on the grandest scale (as regards means, talents and discipline), to which all coming millenniums will look back with envy and awe as a work of perfection:--for the national movement out of which this martial glory springs, is only the counter_-choc_ against Napoleon, and would not have existed without him. To him, consequently, one will one day be able to attribute the fact that _man_ in Europe has again got the upper hand of the merchant and the Philistine; perhaps even of "woman" also, who has become pampered owing to Christianity and the extravagant spirit of the eighteenth century, and still more owing to "modern ideas." Napoleon, who saw in modern ideas, and accordingly in civilisation, something like a personal enemy, has by this hostility proved himself one of the greatest continuators of the Renaissance: he has brought to the surface a whole block of the ancient character, the decisive block perhaps, the block of granite. And who knows but that this block of ancient character will in the end get the upper hand of the national movement, and will have to make itself in a _positive_ sense the heir and continuator of Napoleon:--who, as one knows, wanted _one_ Europe, which was to be _mistress of the world._--

363.

_How each Sex has its Prejudice about Love.--_Notwithstanding all the concessions which I am inclined to make to the monogamie prejudice, I will never admit that we should speak of _equal_ rights in the love of man and woman: there are no such equal rights. The reason is that man and woman understand something different by the term love,--and it belongs to the conditions of love in both sexes that the one sex does _not_ presuppose the same feeling, the same conception of "love," in the other sex. What woman understands by love is clear enough: complete surrender (not merely devotion) of soul and body, without any motive, without any reservation, rather with shame and terror at the thought of a devotion restricted by clauses or associated with conditions. In this absence of conditions her love is precisely a _faith:_ woman has no other.--Man, when he loves a woman, _wants_ precisely this

love from her; he is consequently, as regards himself, furthest removed from the prerequisites of feminine love; granted, however, that there should also be men to whom on their side the demand for complete devotion is not unfamiliar,--well, they are really--not men. A man who loves like a woman becomes thereby a slave; a woman, however, who loves like a woman becomes thereby a _more perfect_ woman. ... The passion of woman in its unconditional renunciation of its own rights presupposes in fact that there does _not_ exist on the other side an equal _pathos,_ an equal desire for renunciation: for if both renounced themselves out of love, there would result--well, I don't know what, perhaps a _horror vacui?_ Woman wants to be taken and accepted as a possession, she wishes to be merged in the conceptions of "possession" and "possessed"; consequently she wants one who _takes,_ who does not offer and give himself away, but who reversely is rather to be made richer in "himself"--by the increase of power, happiness and faith which the woman herself gives to him. Woman gives herself, man takes her.--I do not think one will get over this natural contrast by any social contract, or with the very best will to do justice, however desirable it may be to avoid bringing the severe, frightful, enigmatical, and unmoral elements of this antagonism constantly before our eyes. For love, regarded as complete, great, and full, is nature, and as nature, is to all eternity something "unmoral."_--Fidelity_ is accordingly included in woman's love, it follows from the definition thereof; with man fidelity _may_ readily result in consequence of his love, perhaps as gratitude or idiosyncrasy of taste, and so-called elective affinity, but it does not belong to the _essence_ of his love--and indeed so little, that one might almost be entitled to speak of a natural opposition between love and fidelity in man, whose love is just a desire to possess, and _not_ a renunciation and giving away; the desire to possess, however, comes to an end every time with the possession.... As a matter of fact it is the more subtle and jealous thirst for possession in a man (who is rarely and tardily convinced of having this "possession"), which makes his love continue; in that case it is even possible that his love may increase after the surrender,--he does not readily own that a woman has nothing more to "surrender" to him.--

364.

The Anchorite Speaks.--The art of associating with men rests essentially on one's skilfulness (which presupposes long exercise) in accepting a repast, in taking a repast, in the cuisine of which one has no confidence. Provided one comes to the table with the hunger of a wolf everything is easy "the worst society gives thee _experience_"-- Mephistopheles says; but one has not always this wolf's-hunger when one needs it! Alas! how difficult are our fellow-men to digest! First principle: to stake one's courage as in a misfortune, to seize boldly, to admire oneself at the same time, to take one's repugnance between one's teeth, to cram down one's disgust. Second principle: to "improve" one's fellow-man, by praise for example, so that he may begin to sweat out his self-complacency; or to seize a tuft of his good or "interesting" qualities, and pull at it till one gets his whole virtue out, and can put him under the folds of it. Third principle: self-hypnotism. To fix one's eye on the object of one's intercourse as on a glass knob, until, ceasing to feel pleasure or pain thereat, one falls asleep unobserved, becomes rigid, and acquires a fixed pose: a household recipe used in married life and in friendship, well tested and prized as indispensable, but not yet scientifically formulated. Its proper name is--patience.--

365.

The Anchorite Speaks once more.--We also have intercourse with "men," we also modestly put on the clothes in which people know us (_as such,_) respect us and seek us; and we thereby mingle in society, that is to say, among the disguised who do not wish to be so called; we also do like a prudent masqueraders, and courteously dismiss all curiosity which has not reference merely to our "clothes" There are however other modes and artifices for "going about" among men and associating with them: for example, as a ghost,-which is very advisable when one wants to scare them, and get rid of them easily. An example: a person grasps at us, and is unable to seize us. That frightens him. Or we enter by a closed door. Or when the lights are extinguished. Or after we are dead The latter is the artifice of _posthumous_ men _par excellence._ ("What?" said such a one once impatiently, "do you think we should delight in enduring this strangeness, coldness, death-stillness about us, all this subterranean, hidden, dim, undiscovered solitude, which is called life with us, and might just as well be called death, if we were not conscious of what _will arise_ out of us,--and that only after our death shall we attain to _our_ life and become living, ah! very living! we posthumous men!"--)

366.

At the Sight of a Learned Book.--We do not belong to those who only get their thoughts from books, or at the prompting of books,--it is our custom to think in the open air, walking, leaping, climbing, or dancing on lonesome mountains by preference, or close to the sea, where even the paths become thoughtful. Our first question concerning the value of a book, a man, or a piece of music is: Can it walk? or still better: Can it dance?... We seldom read; we do not read the worse for that--oh, how quickly we divine

how a person has arrived at his thoughts:--if it is by sitting before an ink-bottle with compressed belly and head bent over the paper: oh, how quickly we are then done with his book! The constipated bowels betray themselves, one may wager on it, just as the atmosphere of the room, the ceiling of the room, the smallness of the room, betray themselves.--These were my feelings when closing a straightforward, learned book, thankful, very thankful, but also relieved.... In the book of a learned man there is almost always something oppressive and oppressed: the "specialist" comes to light somewhere, his ardour, his seriousness, his wrath, his over-estimation of the nook in which he sits and spins, his hump--every specialist has his hump. A learned book also always mirrors a distorted soul: every trade distorts. Look at our friends again with whom we have spent our youth, after they have taken possession of their science: alas! how the reverse has always taken place! Alas! how they themselves are now for ever occupied and possessed by their science! Grown into their nook, crumpled into unrecognisability, constrained, deprived of their equilibrium, emaciated and angular everywhere, perfectly round only in one place,--we are moved and silent when we find them so. Every handicraft, granting even that it has a golden floor,[3] has also a leaden ceiling above it, which presses and presses on the soul, till it is pressed into a strange and distorted shape. There is nothing to alter here. We need not think that it is at all possible to obviate this disfigurement by any educational artifice whatever. Every kind of _perfection_ is purchased at a high price on earth, where everything is perhaps purchased too dear; one is an expert in one's department at the price of being also a victim of one's department. But you want to have it otherwise--"more reasonable," above all more convenient--is it not so, my dear contemporaries? Very well! But then you will also immediately get something different: instead of the craftsman and expert, you will get the literary man, the versatile, "many-sided "littérateur, who to be sure lacks the hump--not taking account of the hump or bow which he makes before you as the shopman of the intellect and the "porter" of culture--, the littérateur, who _is_ really nothing, but "represents" almost everything: he plays and "represents" the expert, he also takes it upon himself in all modesty _to see that he is_ paid, honoured and celebrated in this position.--No, my learned friends! I bless you even on account of your humps! And also because like me you despise the littérateurs and parasites of culture! And because you do not know how to make merchandise of your intellect! And have so many opinions which cannot be expressed in money value! And because you do not represent anything which you _are_ not! Because your sole desire is to become masters of your craft; because you reverence every kind of mastership and ability, and repudiate with the most relentless scorn everything of a make-believe, half-genuine, dressed-up, virtuoso, demagogic, histrionic nature in _litteris et artibus_--all that which does not convince you by its absolute _genuineness_ of discipline and preparatory training, or cannot stand your test! (Even genius does not help a person to get over such a defect, however well it may be able to deceive with regard to it: one understands this if one has once looked closely at our most gifted painters and musicians,--who almost without exception, can artificially and supplementarily appropriate to themselves (by means of artful inventions of style, make-shifts, and even principles), the _appearance_ of that genuineness, that solidity of training and culture; to be sure, without thereby deceiving themselves, without thereby imposing perpetual silence on their bad consciences. For you know of course that all great modern artists suffer from bad consciences?...)

[3] An allusion to the German Proverb, "Handwerk hat einen goldenen Boden."--TR.

367.

_How one has to Distinguish first of all in Works of Art--_Everything that is thought, versified, painted and composed, yea, even built and moulded, belongs either to monologic art, or to art before witnesses. Under the latter there is also to be included the apparently monologic art which involves the belief in God, the whole lyric of prayer; because for a pious man there is no solitude,--we, the godless, have been the first to devise this invention. I know of no profounder distinction in all the perspective of the artist than this: Whether he looks at his growing work of art (at "himself--") with the eye of the witness; or whether he "has forgotten the world," as is the essential thing in all monologic art,--it rests _on forgetting,_ it is the music of forgetting.

368.

_The Cynic Speaks.--_My objections to Wagner's music are physiological objections. Why should I therefore begin by disguising them Under æsthetic formulæ? My "point" is that I can no longer breathe freely when this music begins to operate on me; my _foot_ immediately becomes indignant at it and rebels: for what it needs is time, dance and march; it demands first of all from music the ecstasies which are in _good_ walking, striding, leaping and dancing. But do not my stomach, my heart, my blood and my bowels also protest? Do I not become hoarse unawares under its influence? And then I ask myself what my body really _wants_ from music generally. I believe it wants to have _relief:_ so that all animal functions should be accelerated by means of light, bold, unfettered, self-assured rhythms; so that brazen, leaden life should be gilded by means of golden, good, tender harmonies. My melancholy would fain rest its head in the hiding-places and abysses of _perfection:_ for this reason I need music. What do I care

for the drama! What do I care for the spasms of its moral ecstasies, in which the "people" have their satisfaction! What do I care for the whole pantomimic hocus-pocus of the actor!... It will now be divined that I am essentially anti-theatrical at heart,--but Wagner on the contrary, was essentially a man of the stage and an actor, the most enthusiastic mummer-worshipper that has ever existed, even among musicians!... And let it be said in passing that if Wagner's theory was that "drama is the object, and music is only the means to it,"--his _practice_ on the contrary from beginning to end has been to the effect that "attitude is the object, drama and even music can never be anything else but means to _this._" Music as a means of elucidating, strengthening and intensifying dramatic poses and the actor's appeal to the senses, and Wagnerian drama only an opportunity for a number of dramatic attitudes! Wagner possessed, along with all other instincts, the dictatorial instinct of a great actor in all and everything, and as has been said, also as a musician.--I once made this clear with some trouble to a thorough-going Wagnerian, and I had reasons for adding:--"Do be a little more honest with yourself: we are not now in the theatre. In the theatre we are only honest in the mass; as individuals we lie, we belie even ourselves. We leave ourselves at home when we go to the theatre; we there renounce the right to our own tongue and choice, to our taste, and even to our courage as we possess it and practise it within our own four walls in relation to God and man. No one takes his finest taste in art into the theatre with him, not even the artist who works for the theatre: there one is people, public, herd, woman, Pharisee, voting animal, democrat, neighbour, and fellow-creature; there even the most personal conscience succumbs to the levelling charm of the 'great multitude'; there stupidity operates as wantonness and contagion; there the neighbour rules, there one _becomes_ a neighbour...." (I have forgotten to mention what my enlightened Wagnerian answered to my physiological objections: "So the fact is that you are really not healthy enough for our music?"--)

369.

Juxtapositions in us.--Must we not acknowledge to ourselves, we artists, that there is a strange discrepancy in us; that on the one hand our taste, and on the other hand our creative power, keep apart in an extraordinary manner, continue apart, and have a separate growth;--I mean to say that they have entirely different gradations and _tempi_ of age, youth, maturity, mellowness and rottenness? So that, for example, a musician could all his life create things which _contradicted_ all that his ear and heart, spoilt for listening, prized, relished and preferred:--he would not even require to be aware of the contradiction! As an almost painfully regular experience shows, a person's taste can easily outgrow the taste of his power, even without the latter being thereby paralysed or checked in its productivity. The reverse, however, can also to some extent take place,--and it is to this especially that I should like to direct the attention of artists. A constant producer, a man who is a "mother" in the grand sense of the term, one who no longer knows or hears of anything except pregnancies and child-beds of his spirit, who has no time at all to reflect and make comparisons with regard to himself and his work, who is also no longer inclined to exercise his taste, but simply forgets it, letting it take its chance of standing, lying or falling,--perhaps such a man at last produces works _on which he is then quite unfit to pass a judgment:_ so that he speaks and thinks foolishly about them and about himself. This seems to me almost the normal condition with fruitful artists,--nobody knows a child worse than its parents--and the rule applies even (to take an immense example) to the entire Greek world of poetry and art, which was never "conscious" of what it had done....

370.

What is Romanticism?--It will be remembered perhaps, at least among my friends, that at first I assailed the modern world with some gross errors and exaggerations, but at any rate with _hope_ in my heart. I recognised--who knows from what personal experiences?--the philosophical pessimism of the nineteenth century as the symptom of a higher power of thought, a more daring courage and a more triumphant _plenitude_ of life than had been characteristic of the eighteenth century, the age of Hume, Kant, Condillac, and the sensualists: so that the tragic view of things seemed to me the peculiar _luxury_ of our culture, its most precious, noble, and dangerous mode of prodigality; but nevertheless, in view of its overflowing wealth, a _justifiable_ luxury. In the same way I interpreted for myself German music as the expression of a Dionysian power in the German soul: I thought I heard in it the earthquake by means of which a primeval force that had been imprisoned for ages was finally finding vent--indifferent as to whether all that usually calls itself culture was thereby made to totter. It is obvious that I then misunderstood what constitutes the veritable character both of philosophical pessimism and of German music,--namely, their _Romanticism._ What is Romanticism? Every art and every philosophy may be regarded as a healing and helping appliance in the service of growing, struggling life: they always presuppose suffering and sufferers. But there are two kinds of sufferers: on the one hand those that suffer from _overflowing vitality,_ who need Dionysian art, and require a tragic view and insight into life; and on the other hand those who suffer from _reduced vitality,_ who seek repose, quietness, calm seas, and deliverance from themselves through art or knowledge, or else intoxication, spasm, bewilderment and madness. All Romanticism in art and knowledge responds to the twofold craving of the _latter;_ to them Schopenhauer as well as Wagner responded (and responds),--to name those most celebrated and decided

romanticists, who were then _misunderstood_ by me (_not_ however to their disadvantage, as may be reasonably conceded to me). The being richest in overflowing vitality, the Dionysian God and man, may not only allow himself the spectacle of the horrible and questionable, but even the fearful deed itself, and all the luxury of destruction, disorganisation and negation. With him evil, senselessness and ugliness seem as it were licensed, in consequence of the overflowing plenitude of procreative, fructifying power, which can convert every desert into a luxuriant orchard. Conversely, the greatest sufferer, the man poorest in vitality, would have most need of mildness, peace and kindliness in thought and action: he would need, if possible, a God who is specially the God of the sick, a "Saviour"; similarly he would have need of logic, the abstract intelligibility of existence--for logic soothes and gives confidence;--in short he would need a certain warm, fear-dispelling narrowness and imprisonment within optimistic horizons. In this manner I gradually began to understand Epicurus, the opposite of a Dionysian pessimist;--in a similar manner also the "Christian," who in fact is only a type of Epicurean, and like him essentially a romanticist:--and my vision has always become keener in tracing that most difficult and insidious of all forms of _retrospective inference,_ in which, most mistakes have been made--the inference from the work to its author from the deed to its doer, from the ideal to him who _needs_ it, from every mode of thinking and valuing to the imperative _want_ behind it.--In regard to all æsthetic values I now avail myself of this radical distinction: I ask in every single case, "Has hunger or superfluity become creative here?" At the outset another distinction might seem to recommend itself more--it is far more conspicuous,--namely, to have in view whether the desire for rigidity, for perpetuation, for _being_ is the cause of the creating, or the desire for destruction, for change, for the new, for the future--for _becoming._ But when looked at more carefully, both these kinds of desire prove themselves ambiguous, and are explicable precisely according to the before-mentioned, and, as it seems to me, rightly preferred scheme. The desire for _destruction,_ change and becoming, may be the expression of overflowing power, pregnant with futurity (my _terminus_ for this is of course the word "Dionysian"); but it may also be the hatred of the ill-constituted, destitute and unfortunate, which destroys, and _must_ destroy, because the enduring, yea, all that endures, in fact all being, excites and provokes it. To understand this emotion we have but to look closely at our anarchists. The will to _perpetuation_ requires equally a double interpretation. It may on the one hand proceed from gratitude and love:--art of this origin will always be an art of apotheosis, perhaps dithyrambic, as with Rubens, mocking divinely, as with Hafiz, or clear and kind-hearted as with Goethe, and spreading a Homeric brightness and glory over everything (in this case I speak of _Apollonian_ art). It may also, however, be the tyrannical will of a sorely-suffering, struggling or tortured being, who would like to stamp his most personal, individual and narrow characteristics, the very idiosyncrasy of his suffering, as an obligatory law and constraint on others; who, as it were, takes revenge on all things, in that he imprints, enforces and brands _his_ image, the image of _his_ torture, upon them. The latter is _romantic pessimism_ in its most extreme form, whether it be as Schopenhauerian will-philosophy, or as Wagnerian music:--romantic pessimism, the last _great_ event in the destiny of our civilisation. (That there _may be_ quite a different kind of pessimism, a classical pessimism--this presentiment and vision belongs to me, as something inseparable from me, as my _proprium_ and _ipsissimum;_ only that the word "classical" is repugnant to my ears, it has become far too worn, too indefinite and indistinguishable. I call that pessimism of the future,--for it is coming! I see it coming!--_Dionysian_ pessimism.)

371.

We Unintelligible Ones.--Have we ever complained among ourselves of being misunderstood, misjudged, and confounded with others; of being calumniated, misheard, and not heard? That is just our lot--alas, for a long time yet! say, to be modest, until 1901--, it is also our distinction; we should not have sufficient respect for ourselves if we wished it otherwise. People confound us with others--the reason of it is that we ourselves grow, we change continually, we cast off old bark, we still slough every spring, we always become younger, higher, stronger, as men of the future, we thrust our roots always more powerfully into the deep--into evil--, while at the same time we embrace the heavens ever more lovingly, more extensively, and suck in their light ever more eagerly with all our branches and leaves. We grow like trees--that is difficult to understand, like all life!--not in one place, but everywhere, not in one direction only, but upwards and outwards, as well as inwards and downwards. At the same time our force shoots forth in stem, branches, and roots; we are really no longer free to do anything separately, or to _be_ anything separately.... Such is our lot, as we have said: we grow in _height;_ and even should it be our calamity--for we dwell ever closer to the lightning!--well, we honour it none the less on that account; it is that which we do not wish to share with others, which we do not wish to bestow upon others, the fate of all elevation, _our_ fate....

372.

_Why we are not Idealists.--_Formerly philosophers were afraid of the senses: have we, perhaps, been far too forgetful of this fear? We are at present all of us sensualists, we representatives of the present and of the future in philosophy,--_not_ according to theory, however, but in _praxis,_ in practice.... Those former philosophers, on the contrary, thought that the senses lured them out

of _their_ world, the cold realm of "ideas," to a dangerous southern island, where they were afraid that their philosopher-virtues would melt away like snow in the sun. "Wax in the ears," was then almost a condition of philosophising; a genuine philosopher no longer listened to life, in so far as life is music, he _denied_ the music of life--it is an old philosophical superstition that all music is Sirens' music.--Now we should be inclined at the present day to judge precisely in the opposite manner (which in itself might be just as false), and to regard _ideas,_ with their cold, anæmic appearance, and not even in spite of this appearance, as worse seducers than the senses. They have always lived on the "blood" of the philosopher, they always consumed his senses, and indeed, if you will believe me, his "heart" as well. Those old philosophers were heartless: philosophising was always a species of vampirism. At the sight of such figures even as Spinoza, do you not feel a profoundly enigmatical and disquieting sort of impression? Do you not see the drama which is here performed, the constantly _increasing pallor_--, the spiritualisation always more ideally displayed? Do you not imagine some long-concealed blood-sucker in the background, which makes its beginning with the senses, and in the end retains or leaves behind nothing but bones and their rattling?--I mean categories, formulæ, and _words_(for you will pardon me in saying that what _remains_ of Spinoza, _amor intellectualis dei,_ is rattling and nothing more! What is _amor,_ what is _deus,_ when they have lost every drop of blood?...) _In summa:_ all philosophical idealism has hitherto been something like a disease, where it has not been, as in the case of Plato, the prudence of superabundant and dangerous healthfulness, the fear of _overpowerful_ senses, and the wisdom of a wise Socratic.--Perhaps, is it the case that we moderns are merely not sufficiently sound _to require_ Plato's idealism? And we do not fear the senses because----

373.

"Science" as Prejudice.--It follows from the laws of class distinction that the learned, in so far as they belong to the intellectual middle-class, are debarred from getting even a sight of the really _great_ problems and notes of interrogation. Besides, their courage, and similarly their outlook, does not reach so far,--and above all, their need, which makes them investigators, their innate anticipation and desire that things should be constituted _in such and such a way_, their fears and hopes are too soon quieted and set at rest. For example, that which makes the pedantic Englishman, Herbert Spencer, so enthusiastic in his way, and impels him to draw a line of hope, a horizon of desirability, the final reconciliation of "egoism and altruism" of which he dreams,--that almost causes nausea to people like us:--a humanity with such Spencerian perspectives as ultimate perspectives would seem to us deserving of contempt, of extermination! But the _fact_ that something has to be taken by him as his highest hope, which is regarded, and may well be regarded, by others merely as a distasteful possibility, is a note of interrogation which Spencer could not have foreseen.... It is just the same with the belief with which at present so many materialistic natural-scientists are content, the belief in a world which is supposed to have its equivalent and measure in human thinking and human valuations, a "world of truth" at which we might be able ultimately to arrive with the help of our insignificant, four-cornered human reason! What? do we actually wish to have existence debased in that fashion to a ready-reckoner exercise and calculation for stay-at-home mathematicians? We should not, above all, seek to divest existence of its _ambiguous_ character: _good_ taste forbids it, gentlemen, the taste of reverence for everything that goes beyond your horizon! That a world-interpretation is alone right by which _you_ maintain your position, by which investigation and work can go on scientifically in _your_ sense (you really mean _mechanically?_), an interpretation which acknowledges numbering, calculating, weighing, seeing and handling, and nothing more--such an idea is a piece of grossness and naïvety, provided it is not lunacy and idiocy. Would the reverse not be quite probable, that the most superficial and external characters of existence--its most apparent quality, its outside, its embodiment--should let themselves be apprehended first? perhaps alone allow themselves to be apprehended? A "scientific" interpretation of the world as you understand it might consequently still be one of the _stupidest,_ that is to say, the most destitute of significance, of all possible world-interpretations--I say this in confidence to my friends the Mechanicians, who to-day like to hobnob with philosophers, and absolutely believe that mechanics is the teaching of the first and last laws upon which, as upon a ground-floor, all existence must be built. But an essentially mechanical world would be an essentially _meaningless_ world! Supposing we valued the _worth_ of a music with reference to how much it could be counted, calculated, or formulated --how absurd such a "scientific" estimate of music would be! What would one have apprehended, understood, or discerned in it! Nothing, absolutely nothing of what is really "music" in it!...

374.

Our new "Infinite"--How far the perspective character of existence extends, or whether it have any other character at all, whether an existence without explanation, without "sense" does not just become "nonsense," whether, on the other hand, all existence is not essentially an _explaining_ existence--these questions, as is right and proper, cannot be determined even by the most diligent and severely conscientious analysis and self-examination of the intellect, because in this analysis the human intellect cannot avoid

seeing itself in its perspective forms, and _only_ in them. We cannot see round our corner: it is hopeless curiosity to want to know what other modes of intellect and perspective there _might_ be: for example, whether any kind of being could perceive time backwards, or alternately forwards and backwards (by which another direction of life and another conception of cause and effect would be given). But I think that we are to-day at least far from the ludicrous immodesty of decreeing from our nook that there _can_ only be legitimate perspectives from that nook. The world, on the contrary, has once more become "infinite" to us: in so far we cannot dismiss the possibility that it _contains infinite interpretations._ Once more the great horror seizes us--but who would desire forthwith to deify once more _this_ monster of an unknown world in the old fashion? And perhaps worship _the_ unknown thing as _the_ "unknown person" in future? Ah! there are too many _ungodly_ possibilities of interpretation comprised in this unknown, too much devilment, stupidity and folly of interpretation,--our own human, all too human interpretation itself, which we know....

375.

Why we Seem to be Epicureans.--We are cautious, we modern men, with regard to final convictions, our distrust lies in wait for the enchantments and tricks of conscience involved in every strong belief, in every absolute Yea and Nay: how is this explained? Perhaps one may see in it a good deal of the caution of the "burnt child," of the disillusioned idealist; but one may also see in it another and better element, the joyful curiosity of a former lingerer in a corner, who has been brought to despair by his nook, and now luxuriates and revels in its antithesis, in the unbounded, in the "open air in itself." Thus there is developed an almost Epicurean inclination for knowledge, which does not readily lose sight of the questionable character of things; likewise also a repugnance to pompous moral phrases and attitudes, a taste that repudiates all coarse, square contrasts, and is proudly conscious of its habitual reserve. For _this too_ constitutes our pride, this easy tightening of the reins in our headlong impulse after certainty, this self-control of the rider in his most furious riding: for now, as of old, we have mad, fiery steeds under us, and if we delay, it is certainly least of all the danger which causes us to delay....

376.

Our Slow Periods.--It is thus that artists feel, and all men of "works," the maternal species of men: they always believe at every chapter of their life--a work always makes a chapter--that they have now reached the goal itself; they would always patiently accept death with the feeling: "we are ripe for it." This is not the expression of exhaustion,--but rather that of a certain autumnal sunniness and mildness, which the work itself, the maturing of the work, always leaves behind in its originator. Then the _tempo_ of life slows down--turns thick and flows with honey--into long pauses, into the belief in _the_ long pause....

377.

_We Homeless Ones.--_Among the Europeans of to-day there are not lacking those who may call themselves homeless ones in a way which is at once a distinction and an honour; it is by them that my secret wisdom and _gaya scienza_ is especially to be laid to heart! For their lot is hard, their hope uncertain; it is a clever feat to devise consolation for them. But what good does it do! We children of the future, how _could_ we be at home in the present? We are unfavourable to all ideals which could make us feel at home in this frail, broken-down, transition period; and as regards the "realities" thereof, we do not believe in their _endurance. _ The ice which still carries has become very thin: the thawing wind blows; we ourselves, the homeless ones, are an agency that breaks the ice, and the other too thin "realities."... We "preserve" nothing, nor would we return to any past age; we are not at all "liberal," we do not labour for "progress," we do not need first to stop our ears to the song of the market-place and the sirens of the future--their song of "equal rights," "free society," "no longer either lords or slaves," does not allure us! We do not by any means think it desirable that the kingdom of righteousness and peace should be established on earth (because under any circumstances it would be the kingdom of the profoundest mediocrity and Chinaism); we rejoice in all men, who like ourselves love danger, war and adventure, who do not make compromises, nor let themselves be captured, conciliated and stunted; we count ourselves among the conquerors; we ponder over the need of a new order of things, even of a new slavery--for every strengthening and elevation of the type "man" also involves a new form of slavery. Is it not obvious that with all this we must feel ill at ease in an age which claims the honour of being the most humane, gentle and just that the sun has ever seen? What a pity that at the mere mention of these fine words, the thoughts at the bottom of our hearts are all the more unpleasant, that we see therein only the expression--or the masquerade--of profound weakening, exhaustion, age, and declining power! What can it matter to us with what kind of tinsel an invalid decks out his weakness? He may parade it as his _virtue;_ there is no doubt whatever that weakness makes people gentle, alas, so gentle, so just, so inoffensive, so "humane"!--The "religion of pity," to which people would like to persuade us--yes, we

know sufficiently well the hysterical little men and women who need this religion at present as a cloak and adornment! We are no humanitarians; we should not dare to speak of our "love of mankind"; for that, a person of our stamp is not enough of an actor! Or not sufficiently Saint-Simonist, not sufficiently French. A person must have been affected with a _Gallic_ excess of erotic susceptibility and amorous impatience even to approach mankind honourably with his lewdness.... Mankind! Was there ever a more hideous old woman among all old women (unless perhaps it were "the Truth": a question for philosophers)? No, we do not love Mankind! On the other hand, however, we are not nearly "German" enough (in the sense in which the word "German" is current at present) to advocate nationalism and race-hatred, or take delight in the national heart-itch and blood-poisoning, on account of which the nations of Europe are at present bounded off and secluded from one another as if by quarantines. We are too unprejudiced for that, too perverse, too fastidious; also too well-informed, and too much "travelled." We prefer much rather to live on mountains, apart and "out of season," in past or coming centuries, in order merely to spare ourselves the silent rage to which we know we should be condemned as witnesses of a system of politics which makes the German nation barren by making it vain, and which is a _petty_ system besides:--will it not be necessary for this system to plant itself between two mortal hatreds, lest its own creation should immediately collapse? Will it not _be obliged_ to desire the perpetuation of the petty-state system of Europe?... We homeless ones are too diverse and mixed in race and descent for "modern men," and are consequently little tempted to participate in the falsified racial self-admiration and lewdness which at present display themselves in Germany, as signs of German sentiment, and which strike one as doubly false and unbecoming in the people with the "historical sense." We are, in a word--and it shall be our word of honour!--_good Europeans,_ the heirs of Europe, the rich, over-wealthy heirs, but too deeply obligated heirs of millenniums of European thought. As such, we have also outgrown Christianity, and are disinclined to it--and just because we have grown _out of_ it, because our forefathers were Christians uncompromising in their Christian integrity, who willingly sacrificed possessions and positions, blood and country, for the sake of their belief. We--do the same. For what, then? For our unbelief? For all sorts of unbelief? Nay, you know better than that, my friends! The hidden _Yea_ in you is stronger than all the Nays and Perhapses, of which you and your age are sick; and when you are obliged to put out to sea, you emigrants, it is--once more a _faith_ which urges you thereto!...

378.

"And once more Grow Clear."--We, the generous and rich in spirit, who stand at the sides of the streets like open fountains and would hinder no one from drinking from us: we do not know, alas! how to defend ourselves when we should like to do so; we have no means of preventing ourselves being made _turbid_ and dark,--we have no means of preventing the age in which we live casting its "up-to-date rubbish" into us, or of hindering filthy birds throwing their excrement, the boys their trash, and fatigued resting travellers their misery, great and small, into us. But we do as we have always done: we take whatever is cast into us down into our depths--for we are deep, we do not forget--_and once more grow clear_...

379.

The Fool's Interruption.--It is not a misanthrope who has written this book: the hatred of men costs too dear to-day. To hate as they formerly hated _man,_ in the fashion of Timon, completely, without qualification, with all the heart, from the pure _love_ of hatred--for that purpose one would have to renounce contempt:--and how much refined pleasure, how much patience, how much benevolence even, do we owe to contempt! Moreover we are thereby the "elect of God": refined contempt is our taste and privilege, our art, our virtue perhaps, we, the most modern amongst the moderns!... Hatred, on the contrary, makes equal, it puts men face to face, in hatred there is honour; finally, in hatred there is _fear,_ quite a large amount of fear. We fearless ones, however, we, the most intellectual men of the period, know our advantage well enough to live without fear as the most intellectual persons of this age. People will not easily behead us, shut us up, or banish us; they will not even ban or burn our books. The age loves intellect, it loves us, and needs us, even when we have to give it to understand that we are artists in despising; that all intercourse with men is something of a horror to us; that with all our gentleness, patience, humanity and courteousness, we cannot persuade our nose to abandon its prejudice against the proximity of man; that we love nature the more, the less humanly things are done by her, and that we love art _when_ it is the flight of the artist from man, or the raillery of the artist at man, or the raillery of the artist at himself....

380.

"_The Wanderer" Speaks._--In order for once to get a glimpse of our European morality from a distance, in order to compare it with other earlier or future moralities, one must do as the traveller who wants to know the height of the towers of a city: for that purpose he _leaves_ the city. "Thoughts concerning moral prejudices," if they are not to be prejudices concerning prejudices, presuppose a

position _outside of_ morality, some sort of world beyond good and evil, to which one must ascend, climb, or fly--and in the given case at any rate, a position beyond _our_ good and evil, an emancipation from all "Europe," understood as a sum of inviolable valuations which have become part and parcel of our flesh and blood. That one does _want_ to get outside, or aloft, is perhaps a sort of madness, a peculiar, unreasonable "thou must"--for even we thinkers have our idiosyncrasies of "unfree will"--: the question is whether one _can_ really get there. That may depend on manifold conditions: in the main it is a question of how light or how heavy we are, the problem of our "specific gravity." One must be _very light_ in order to impel one's will to knowledge to such a distance, and as it were beyond one's age, in order to create eyes for oneself for the survey of millenniums, and a pure heaven in these eyes besides! One must have freed oneself from many things by which we Europeans of to-day are oppressed, hindered, held down, and made heavy. The man of such a "Beyond," who wants to get even in sight of the highest standards of worth of his age, must first of all "surmount" this age in himself--it is the test of his power--and consequently not only his age, but also his past aversion and opposition _to_ his age, his suffering _caused by_ his age, his unseasonableness, his Romanticism....

381.

The Question of Intelligibility.--One not only wants to be understood when one writes, but also--quite as certainly--_not_ to be understood. It is by no means an objection to a book when someone finds it unintelligible: perhaps this might just have been the intention of its author,--perhaps he did not _want_ to be understood by "anyone." A distinguished intellect and taste, when it wants to communicate its thoughts, always selects its hearers; by selecting them, it at the same time closes its barriers against "the others." It is there that all the more refined laws of style have their origin: they at the same time keep off, they create distance, they prevent "access" (intelligibility, as we have said,)--while they open the ears of those who are acoustically related to them. And to say it between ourselves and with reference to my own case,--I do not desire that either my ignorance, or the vivacity of my temperament, should prevent me being understood by _you,_ my friends: I certainly do not desire that my vivacity should have that effect, however much it may impel me to arrive quickly at an object, in order to arrive at it at all. For I think it is best to do with profound problems as with a cold bath--quickly in, quickly out. That one does not thereby get into the depths, that one does not get deep enough _down_--is a superstition of the hydrophobic, the enemies of cold water; they speak without experience. Oh! the great cold makes one quick!--And let me ask by the way: Is it a fact that a thing has been misunderstood and unrecognised when it has only been touched upon in passing, glanced at, flashed at? Must one absolutely sit upon it in the first place? Must one have brooded on it as on an egg? _Diu noctuque incubando,_ as Newton said of himself? At least there are truths of a peculiar shyness and ticklishness which one can only get hold of suddenly, and in no other way,--which one must either _take by surprise,_ or leave alone.... Finally, my brevity has still another value: on those questions which pre-occupy me, I must say a great deal briefly, in order that it may be heard yet more briefly. For as immoralist, one has to take care lest one ruins innocence, I mean the asses and old maids of both sexes, who get nothing from life but their innocence; moreover my writings are meant to fill them with enthusiasm, to elevate them, to encourage them in virtue. I should be at a loss to know of anything more amusing than to see enthusiastic old asses and maids moved by the sweet feelings of virtue: and "that have I seen"--spake Zarathustra. So much with respect to brevity; the matter stands worse as regards my ignorance, of which I make no secret to myself. There are hours in which I am ashamed of it; to be sure there are likewise hours in which I am ashamed of this shame. Perhaps we philosophers, all of us, are badly placed at present with regard to knowledge: science is growing, the most learned of us are on the point of discovering that we know too little. But it would be worse still if it were otherwise,--if we knew too much; our duty is and remains first of all, not to get into confusion about ourselves. We _are_ different from the learned; although it cannot be denied that amongst other things we are also learned. We have different needs, a different growth, a different digestion: we need more, we need also less. There is no formula as to how much an intellect needs for its nourishment; if, however, its taste be in the direction of independence, rapid coming and going, travelling, and perhaps adventure for which only the swiftest are qualified, it prefers rather to live free on poor fare, than to be unfree and plethoric. Not fat, but the greatest suppleness and power is what a good dancer wishes from his nourishment,--and I know not what the spirit of a philosopher would like better than to be a good dancer. For the dance is his ideal, and also his art, in the end likewise his sole piety, his "divine service."...

382.

Great Healthiness.--We, the new, the nameless, the hard-to-understand, we firstlings of a yet untried future--we require for a new end also a new means, namely, a new healthiness, stronger, sharper, tougher, bolder and merrier than any healthiness hitherto. He whose soul longs to experience the whole range of hitherto recognised values and desirabilities, and to circumnavigate all the coasts of this ideal "Mediterranean Sea," who, from the adventures of his most personal experience, wants to know how it feels to be a conqueror and discoverer of the ideal--as likewise how it is with the artist, the saint, the legislator, the sage, the scholar, the

devotee, the prophet, and the godly Nonconformist of the old style:--requires one thing above all for that purpose, _great healthiness--_such healthiness as one not only possesses, but also constantly acquires and must acquire, because one continually sacrifices it again, and must sacrifice it!--And now, after having been long on the way in this fashion, we Argonauts of the ideal, who are more courageous perhaps than prudent, and often enough shipwrecked and brought to grief, nevertheless, as said above, healthier than people would like to admit, dangerously healthy, always healthy again,--it would seem, as if in recompense for it all, that we have a still undiscovered country before us, the boundaries of which no one has yet seen, a beyond to all countries and corners of the ideal known hitherto, a world so over-rich in the beautiful, the strange, the questionable, the frightful, and the divine, that our curiosity as well as our thirst for possession thereof, have got out of hand--alas! that nothing will now any longer satisfy us! How could we still be content with _the man of the present day_ after such peeps, and with such a craving in our conscience and consciousness? What a pity; but it is unavoidable that we should look on the worthiest aims and hopes of the man of the present day with ill-concealed amusement, and perhaps should no longer look at them. Another ideal runs on before us, a strange, tempting ideal, full of danger, to which we should not like to persuade any one, because we do not so readily acknowledge any one's _right thereto:_ the ideal of a spirit who plays naïvely (that is to say involuntarily and from overflowing abundance and power) with everything that has hitherto been called holy, good, inviolable, divine; to whom the loftiest conception which the people have reasonably made their measure of value, would already imply danger, ruin, abasement, or at least relaxation, blindness, or temporary self-forgetfulness; the ideal of a humanly superhuman welfare and benevolence, which may often enough appear _inhuman,_ for example, when put by the side of all past seriousness on earth, and in comparison with all past solemnities in bearing, word, tone, look, morality and pursuit, as their truest involuntary parody,--but with which, nevertheless, perhaps _the great seriousness_ only commences, the proper interrogation mark is set up, the fate of the soul changes, the hour-hand moves, and tragedy _begins_....

383.

Epilogue.---But while I slowly, slowly finish the painting of this sombre interrogation-mark, and am still inclined to remind my readers of the virtues of right reading--oh, what forgotten and unknown virtues--it comes to pass that the wickedest, merriest, gnome-like laughter resounds around me: the spirits of my book themselves pounce upon me, pull me by the ears, and call me to order. "We cannot endure it any longer," they shout to me, "away, away with this raven-black music. Is it not clear morning round about us? And green, soft ground and turf, the domain of the dance? Was there ever a better hour in which to be joyful? Who will sing us a song, a morning song, so sunny, so light and so fledged that it will _not_ scare the tantrums,--but will rather invite them to take part in the singing and dancing. And better a simple rustic bagpipe than such weird sounds, such toad-croakings, grave-voices and marmot-pipings, with which you have hitherto regaled us in your wilderness, Mr Anchorite and Musician of the Future! No! Not such tones! But let us strike up something more agreeable and more joyful!"--You would like to have it so, my impatient friends? Well! Who would not willingly accede to your wishes? My bagpipe is waiting, and my voice also--it may sound a little hoarse; take it as it is! don't forget we are in the mountains! But what you will hear is at least new; and if you do not understand it, if you misunderstand the _minstrel,_ what does it matter! That--has always been "The Minstrel's Curse."[4] So much the more distinctly can you hear his music and melody, so much the better also can you--dance to his piping. _Would you like_ to do that?...

[4] Title of the well-known poem of Uhland.--TR.

APPENDIX

SONGS OF PRINCE FREE-AS-A-BIRD

TO GOETHE.[1]

"The Undecaying" Is but thy label, God the betraying Is poets' fable.

Our aims all are thwarted By the World-wheel's blind roll: "Doom," says the downhearted, "Sport," says the fool.

The World-sport, all-ruling, Mingles false with true: The Eternally Fooling Makes us play, too!

THE POET'S CALL.

As 'neath a shady tree I sat After long toil to take my pleasure, I heard a tapping "pit-a-pat" Beat prettily in rhythmic measure. Tho' first I scowled, my face set hard, The sound at length my sense entrapping Forced me to speak like any bard, And keep true time unto the tapping.

As I made verses, never stopping, Each syllable the bird went after, Keeping in time with dainty hopping! I burst into unmeasured laughter! What, you a poet? You a poet? Can your brains truly so addled be? "Yes, yes, good sir, you are a poet," Chirped out the pecker, mocking me.

What doth me to these woods entice? The chance to give some thief a trouncing? A saw, an image? Ha, in a trice My rhyme is on it, swiftly pouncing! All things that creep or crawl the poet Weaves in his word-loom cunningly. "Yes, yes, good sir, you are a poet," Chirped out the pecker, mocking me.

Like to an arrow, methinks, a verse is, See how it quivers, pricks and smarts When shot full straight (no tender mercies!) Into the reptile's nobler parts!

Wretches, you die at the hand of the poet, Or stagger like men that have drunk too free. "Yes, yes, good sir, you are a poet," Chirped out the pecker, mocking me.

So they go hurrying, stanzas malign, Drunken words--what a clattering, banging!-- Till the whole company, line on line, All on the rhythmic chain are hanging. Has he really a cruel heart, your poet? Are there fiends who rejoice, the slaughter to see "Yes, yes, good sir, you are a poet," Chirped out the pecker, mocking me.

So you jest at me, bird, with your scornful graces? So sore indeed is the plight of my head? And my heart, you say, in yet sorrier case is? Beware! for my wrath is a thing to dread! Yet e'en in the hour of his wrath the poet Rhymes you and sings with the selfsame glee. "Yes, yes, good sir, you are a poet," Chirped out the pecker, mocking me.

IN THE SOUTH.[2]

I swing on a bough, and rest My tired limbs in a nest, In the rocking home of a bird, Wherein I perch as his guest, In the South!

I gaze on the ocean asleep, On the purple sail of a boat; On the harbour and tower steep, On the rocks that stand out of the deep, In the South!

For I could no longer stay, To crawl in slow German way; So I called to the birds, bade the wind Lift me up and bear me away To the South!

No reasons for me, if you please; Their end is too dull and too plain; But a pair of wings and a breeze, With courage and health and ease, And games that chase disease From the South!

Wise thoughts can move without sound,-But I've songs that I can't sing alone; So birdies, pray gather around, And listen to what I have found In the South! . . . . . "You are merry lovers and false and gay, "In frolics and sport you pass the day; "Whilst in the North, I shudder to say, "I worshipped a woman, hideous and gray, "Her name was Truth, so I heard them say, "But I left her there and I flew away "To the South!"

BEPPA THE PIOUS.

While beauty in my face is, Be piety my care, For God, you know, loves lasses, And, more than all, the fair. And if yon hapless monkling Is fain with me to live, Like many another monkling, God surely will forgive.

No grey old priestly devil, But, young, with cheeks aflame--Who e'en when sick with revel, Can jealous be and blame. To greybeards I'm a stranger, And he, too, hates the old: Of God, the world-arranger, The wisdom here behold!

The Church has ken of living, And tests by heart and face. To me she'll be forgiving! Who will not show me grace? I lisp with pretty halting, I curtsey, bid "good day," And with the fresh defaulting I wash the old away!

Praise be this man-God's guerdon, Who loves all maidens fair, And his own heart can pardon The sin he planted there.

While beauty in my face is, With piety I'll stand, When age has killed my graces, Let Satan claim my hand!

THE BOAT OF MYSTERY.

Yester-eve, when all things slept-- Scarce a breeze to stir the lane-- I a restless vigil kept, Nor from pillows sleep could gain, Nor from poppies nor--most sure Of opiates--a conscience pure.

Thoughts of rest I 'gan forswear, Rose and walked along the strand, Found, in warm and moonlit air, Man and boat upon the sand, Drowsy both, and drowsily Did the boat put out to sea.

Passed an hour or two perchance, Or a year? then thought and sense Vanished in the engulfing trance Of a vast Indifference. Fathomless, abysses dread Opened--then the vision fled.

Morning came: becalmed, the boat Rested on the purple flood: "What had happened?" every throat Shrieked the question: "was there-- Blood?" Naught had happened! On the swell We had slumbered, oh, so well!

AN AVOWAL OF LOVE

(_during which, however, the poet fell into a pit_).

Oh marvel! there he flies Cleaving the sky with wings unmoved--what force Impels him, bids him rise, What curb restrains him? Where's his goal, his course?

Like stars and time eterne He liveth now in heights that life forswore, Nor envy's self doth spurn: A lofty flight were't, e'en to see him soar!

Oh albatross, great bird, Speeding me upward ever through the blue! I thought of her, was stirred To tears unending--yea, I love her true!

SONG OF A THEOCRITEAN GOATHERD.

Here I lie, my bowels sore, Hosts of bugs advancing, Yonder lights and romp and roar! What's that sound? They're dancing!

At this instant, so she prated, Stealthily she'd meet me: Like a faithful dog I've waited, Not a sign to greet me!

She promised, made the cross-sign, too, Could her vows be hollow? Or runs she after all that woo, Like the goats I follow?

Whence your silken gown, my maid? Ah, you'd fain be haughty, Yet perchance you've proved a jade With some satyr naughty!

Waiting long, the lovelorn wight Is filled with rage and poison: Even so on sultry night Toadstools grow in foison.

Pinching sore, in devil's mood, Love doth plague my crupper: Truly I can eat no food: Farewell, onion-supper!

Seaward sinks the moon away, The stars are wan, and flare not: Dawn approaches, gloomy, grey, Let Death come! I care not!

"SOULS THAT LACK DETERMINATION."

Souls that lack determination Rouse my wrath to white-hot flame! All their glory's but vexation, All their praise but self-contempt and shame!

Since I baffle their advances, Will not clutch their leading-string, They would wither me with glances Bitter-sweet, with hopeless envy sting.

Let them with fell curses shiver, Curl their lip the livelong day! Seek me as they will, forever Helplessly their eyes shall go astray!

THE FOOL'S DILEMMA.

Ah, what I wrote on board and wall With foolish heart, in foolish scrawl, I meant but for their decoration!

Yet say you, "Fools' abomination! Both board and wall require purgation, And let no trace our eyes appal!"

Well, I will help you, as I can, For sponge and broom are my vocation As critic and as waterman.

But when the finished work I scan, I'm glad to see each learned owl With "wisdom" board and wall defoul.

RIMUS REMEDIUM

(_or a Consolation to Sick Poets_).

From thy moist lips, O Time, thou witch, beslavering me, Hour upon hour too slowly drips In vain--I cry, in frenzy's fit, "A curse upon that yawning pit, A curse upon Eternity!"

The world's of brass, A fiery bullock, deaf to wail: Pain's dagger pierces my cuirass, Wingéd, and writes upon my bone: "Bowels and heart the world hath none, Why scourge her sins with anger's flail?"

Pour poppies now, Pour venom, Fever, on my brain! Too long you test my hand and brow: What ask you? "What--reward is paid?" A malediction on you, jade, And your disdain!

No, I retract, 'Tis cold--I hear the rain importune-- Fever, I'll soften, show my tact: Here's gold--a coin--see it gleam! Shall I with blessings on you beam, Call you "good fortune"?

The door opes wide, And raindrops on my bed are scattered, The light's blown out--woes multiplied! He that hath not an hundred rhymes, I'll wager, in these dolorous times We'd see him shattered!

MY BLISS.

Once more, St Mark, thy pigeons meet my gaze, The Square lies still, in slumbering morning mood: In soft, cool air I fashion idle lays, Speeding them skyward like a pigeon's brood: And then recall my minions To tie fresh rhymes upon their willing pinions. My bliss! My bliss!

Calm heavenly roof of azure silkiness, Guarding with shimmering haze yon house divine! Thee, house, I love, fear--envy, I'll confess, And gladly would suck out that soul of thine! "Should I give back the prize?" Ask not, great pasture-ground for human eyes! My bliss! My bliss!

Stern belfry, rising as with lion's leap Sheer from the soil in easy victory, That fill'st the Square with peal resounding, deep Wert thou in French that Square's "accent aigu"? Were I for ages set In earth like thee, I know what silk-meshed net---- My bliss! My bliss!

Hence, music! First let darker shadows come, And grow, and merge into brown, mellow night! Tis early for your pealing, ere the dome Sparkle in roseate glory, gold-bedight While yet 'tis day, there's time For strolling, lonely muttering, forging rhyme-- My bliss! My bliss!

COLUMBUS REDIVIVUS.

Thither I'll travel, that's my notion, I'll trust myself, my grip, Where opens wide and blue the ocean I'll ply my Genoa ship.

New things on new the world unfolds me, Time, space with noonday die: Alone thy monstrous eye beholds me, Awful Infinity!

SILS-MARIA.

Here sat I waiting, waiting, but for naught! Beyond all good and evil--now by light wrought

To joy, now by dark shadows--all was leisure, All lake, all noon, all time sans aim, sans measure.

Then one, dear friend, was swiftly changed to twain, And Zarathustra left my teeming brain....

A DANCING SONG TO THE MISTRAL WIND.[3]

Wildly rushing, clouds outleaping, Care-destroying, Heaven sweeping, Mistral wind, thou art my friend! Surely 'twas one womb did bear us, Surely 'twas one fate did pair us, Fellows for a common end.

From the crags I gaily greet you, Running fast I come to meet you, Dancing while you pipe and sing. How you bound across the ocean, Unimpeded, free in motion, Swifter than with boat or wing!

Through my dreams your whistle sounded, Down the rocky stairs I bounded To the golden ocean wall; Saw you hasten, swift and glorious, Like a river, strong, victorious, Tumbling in a waterfall.

Saw you rushing over Heaven, With your steeds so wildly driven, Saw the car in which you flew; Saw the lash that wheeled and quivered, While the hand that held it shivered, Urging on the steeds anew.

Saw you from your chariot swinging, So that swifter downward springing Like an arrow you might go Straight into the deep abysses, As a sunbeam falls and kisses Roses in the morning glow.

Dance, oh! dance on all the edges, Wave-crests, cliffs and mountain ledges, Ever finding dances new! Let our knowledge be our gladness, Let our art be sport and madness, All that's joyful shall be true!

Let us snatch from every bower, As we pass, the fairest flower, With some leaves to make a crown; Then, like minstrels gaily dancing, Saint and witch together prancing, Let us foot it up and down.

Those who come must move as; quickly As the wind--we'll have no sickly, Crippled, withered, in our crew.; Off with hypocrites and preachers, Proper folk and prosy teachers, Sweep them from our heaven blue.

Sweep away all sad grimaces, Whirl the dust into the faces Of the dismal sick and cold! Hunt them from our breezy places, Not for them the wind that braces, But for men of visage bold.

Off with those who spoil earth's gladness, Blow away all clouds of sadness, Till our heaven clear we see; Let me hold thy hand, best fellow, Till my joy like tempest bellow! Freest thou of spirits free!

When thou partest, take a token Of the joy thou hast awoken, Take our wreath and fling it far; Toss it up and catch it never, Whirl it on before thee ever, Till it reach the farthest star.

[1] This poem is a parody of the "Chorus Mysticus" which concludes the second part of Goethe's "Faust." Bayard Taylor's translation of the passage in "Faust" runs as follows:--

"All things transitory But as symbols are sent, Earth's insufficiency Here grows to Event: The Indescribable Here it is done: The Woman-Soul leadeth us Upward and on!"

Enfranchisement of women

Harriet Hardy Taylor MillThe Project Gutenberg eBook of La Igualdad Social y Política y sus Relaciones con la Libertad

Project Gutenberg Release: July 05, 2016 · eBook #52502

Nota del Transcriptor:

Se ha respetado la ortografía y la acentuación del original.

Errores obvios de imprenta han sido corregidos.

Páginas en blanco han sido eliminadas.

Letras itálicas son denotadas con _líneas_.

Letras oscuras son denotadas con =signos de igual=.

Las versalitas (letras mayúsculas de tamaño igual a las minúsculas) han sido sustituidas por letras mayúsculas de tamaño normal.

INTRODUCCIÓN.[1]

[1] Este trabajo fué hecho en 1862, y revisado por vez primera en 1876. No debió mi madre darlo por terminado en esa fecha, cuando en 1892 volvió otra vez á repasar lo hecho en 1862 y 1876. En esta labor había llegado hasta el final del capítulo II de la segunda parte; pero ni aun lo anterior lo consideraba concluído, puesto que el borrador del índice tiene entre paréntesis la indicación de (provisional).--F. G. A.

Basta considerar la frecuencia con que se habla de _igualdad_, el calor con que se discute, la multitud de personas que toman parte en la discusión ó se interesan en ella, la vehemencia con que se ataca y se defiende, la pertinacia con que se afirma ó se niega, la confianza con que se invoca como un medio de salvación, el horror con que se rechaza como una causa de ruina; basta observar estos contrastes, no sólo reproducidos, sino crecientes, para sospechar que la igualdad no es una de esas ideas fugaces que pasan con las circunstancias que las han producido, sino que tiene raíces profundas en la naturaleza del hombre, y es, por lo tanto, un elemento poderoso y permanente de las sociedades humanas.

Esta sospecha se confirma, pasando á convencimiento, al ver en la historia la igualdad luchando con el privilegio; vencida, no exterminada, rebelarse cuando se la creía para siempre bajo el yugo; existir, si no en realidad, en idea y esperanza, y, derecho ó aspiración, aparecer en todo pueblo que tiene poderosos gérmenes de vida.

Aspiración generosa, instinto depravado, impulso ciego, deseo razonable, sueño loco; bajo todas estas formas se presenta la igualdad, ya matrona venerable, con balanza equitativa como la justicia, ya furia, que agita en sus manos rapaces tea incendiaria.

La igualdad en la abyección; la igualdad en el derecho; un populacho vil que quiere pasar, sobre todos, el nivel de su ignominia; un pueblo digno que se opone á que la justicia sea privilegio: el pensador, buen amigo de las multitudes, que procura ilustrarlas; el fanático ó el ambicioso, que las extravía, todos hablan de igualdad, aunque cada uno la comprenda de distinta manera.

Esta diferencia en el modo de concebir una misma cosa se observa en otras muchas; pero tal vez en ninguna es más perceptible que en la igualdad, porque no hay quizás aspiración que tan fácilmente pase de razonable á absurda, cuyos verdaderos límites sean tan fáciles de traspasar, que se ramifique y extienda tanto á todas las esferas de la vida, ni que haga tan estrecha alianza con una pasión implacable y vil: la envidia. La envidia enciende sus rencores y destila su veneno en los individuos y en las multitudes que convierten la igualdad en bandera de exterminio, y por eso son á veces tan sordas á la voz de la razón y á las súplicas de la misericordia.

Estudiando la igualdad en el pasado, no se la ve seguir un curso más ó menos rápido, más ó menos regular; su brillo no crece con las luces de la inteligencia; su marcha no es paralela á la del progreso humano: tiene resplandores de relámpago, movimientos vertiginosos, y á veces cada paso asemeja á una erupción. Esto no es decir que carezca de ley, no; el huracán y la tempestad tienen la suya; pero es considerar cuán difícil ha de ser la observación de un fenómeno relacionado con tantos otros, y que no puede conocerse bien sino conociéndolos todos.

Mas por dificultoso que sea el estudio, parece necesario; la igualdad no se invoca ya por unos pocos, sino por el mayor número; no se limita á una ú otra esfera de la vida, pretende invadirlas todas, y sin saber lo que es, ni los obstáculos que halla, ni el modo de vencerlos, se pretende suprimir el tiempo necesario, el trabajo indispensable, y supliendo la fuerza con la violencia, lograr instantáneamente lo que sólo se realizará en el porvenir, ó lo que no podrá realizarse nunca. Estas aspiraciones las tiene el que padece, con la impaciencia de quien sufre, con la cólera del que halla un remedio ó un alivio que supone negado por la injusticia y el egoísmo. Y no son cientos ni miles, sino millones de cóleras impacientes y doloridas, que piden á la igualdad un recurso para su penuria y una satisfacción para su amor propio. Y estos millones de impacientes iracundos comunican entre sí; es decir, que multiplican su impaciencia y su ira, que, contenida á intervalos, y á intervalos desenfrenada, es amenazadora siempre.

Enfrente de los que esperan en la igualdad están los que la temen, los que ven en ella una cosa monstruosa, imposible, absurda, injusta; un sueño de la fiebre popular, un producto de las malas pasiones de la plebe, ó un medio de explotarlas. Para éstos, la igualdad es sinónimo de anarquía, de caos, de degradación, hasta el punto que _igualarse_ viene á ser _rebajarse_, y persona _distinguida_ equivale á persona _digna_.

El antagonismo no puede ser más evidente: lo que para éstos es un atentado, para aquéllos es un derecho; aberración para unos, dogma para otros.

Los dogmas se creen; los partidarios de la igualdad, las multitudes al menos, creen en ella, la afirman con la seguridad del que no ha pensado, con la vehemencia del que espera, y, como todo ignorante que sea apasionado, están dispuestos á imponer la creencia.

El dogmatismo que suele aplicarse á las cosas espirituales aquí interviene en las materiales, y no tiene un reducido número de oráculos en el aula ó en el templo, sino que abre cátedra donde quiera, en calles y plazas, en caminos y en veredas. El dogmatismo filosófico y religioso tiene máximas y preceptos que son promesas, reglas que enfrenan las pasiones, y aunque influya en las cosas materiales, no se dirige tan inmediata y directamente á ellas como el dogma de la igualdad. No se trata ya sólo de ser todos igualmente hijos de Dios, que no hará más distinción que entre justos y pecadores; de ser juzgados por la misma ley penal, y de suprimir todo privilegio en la política, sino de promulgar la económica de modo que desaparezcan las diferencias en las cosas que importan más, porque no se da tanto valor á tener voto en los comicios como pan y comodidades en casa. La insurrección económica, la huelga, es la más frecuente, casi la única, y manifiesta adónde se quiere aplicar el nivel con más empeño.

Mientras otros dogmas pierden prestigio, el de la igualdad aumenta el número de sus prosélitos, y extiende su acción en cada individuo; no hay fenómeno social en que no aparezca su influencia, difícil determinar hasta dónde llegará, al menos como aspiración. ¿Quién pone límites á la fe y á la esperanza?

Y, no obstante, se comprende la necesidad de ponerlos cuando la esperanza y la fe no se alimentan de espirituales promesas para otra vida, sino que quieren realizarse en ésta con la posesión inmediata de ventajas positivas y materiales bienes. Agréguese que éstos no se buscan siempre por la persuasión, sino recurriendo á la fuerza, y es de temer que la apelación á ella se repita más y más si no se contiene la fermentación de las impaciencias. Uno de los medios de contenerlas es discutirlas; citar ante el tribunal de la razón á los contendientes; oirlos con imparcialidad; no negar el derecho porque sea nuevo ni porque sea viejo, sino atendiendo á la justicia; precaverse contra la pasión, que no siempre es vocinglera; contra el egoísmo, que puede ser cínico ó hipócrita; determinar bien los puntos esenciales que se discuten para quitar al asunto mucho de lo vago que hoy tiene; señalar las contradicciones que hayan podido pasar desapercibidas, pero que en los hechos dan lugar á choques y conflictos, y de este modo contribuir á que, respecto á la igualdad, se tenga opinión que se discute, un elemento social que se analiza, y no un dogma que se impone ó un arma con que se amenaza.

PARTE PRIMERA.

De la igualdad considerada social y filosóficamente.

CAPÍTULO PRIMERO.

NOCIONES GENERALES.

La idea de _igualdad_ supone la de _diferencia_: si no se hubiesen notado maneras de ser diferentes, no cabía afirmar que las hubiera iguales; no se diría que los hombres lo eran, sino comprendiendo que pueden dejar de serlo. Que los aficionados á los estudios psicológicos, que propenden á ver _sucesivos_ fenómenos que tal vez son _simultáneos_, discutan si la noción de igualdad ha seguido ó precedido á la de diferencia; á nosotros nos basta hacer constar que si todos fueran, se sintieran y se supieran iguales, no se discutiría acerca de la igualdad, viviríamos sin afirmarla ni negarla, sin notarla; no habría idea de ella, como no existiría la de salud si no se hubieran visto vivientes enfermos ni se concibiera que pudiesen estarlo. Anterior, posterior ó simultánea, negación ó afirmación de semejanzas ó de diferencias, la igualdad y la desigualdad coexisten de tal manera, que no puede concebirse la una sin la otra, y que el estudio de cualquiera de ellas es el estudio de entrambas.

Si, pues, desde el primer momento que meditamos sobre la igualdad la vemos que coexiste con la desigualdad, y que no se concibe sin ella, la primera consecuencia que sacaremos es que entrambas existen necesariamente, que son indestructibles la una como la otra, y que ni el nivel ni el privilegio pueden ser un medio permanente de establecer la paz y la justicia, porque uno y otro prescinden de la naturaleza de las cosas. Los defensores del privilegio niegan las semejanzas, los niveladores las diferencias, sin ver que unas y otras se prueban en el hecho mismo de tener idea de igualdad y desigualdad. Sus grados, clase y resultados darán lugar á discusiones y dudas; pero que al menos quede fuera de ella que la igualdad y la desigualdad se suponen mutuamente, coexisten son un elemento necesario que se puede modificar, combinar de este ó del otro modo, pero no suprimir; y la razón nos pone á cubierto de los radicalismos que entienden arrancar de raíz los abusos ó los errores, cuando no hacen más que prescindir de lo que es esencial á la naturaleza humana.

La igualdad supone comparación, y la comparación cosas ó personas que han de ser comparadas. Ya se sabe que todo sér es _idéntico á sí mismo_; de modo que, cuando se dice _igual_, evidentemente hay que referirse á _otro_. Igualdad supone _pluralidad_ de personas ó cosas que no se aislan, sino que, por el contrario, se aproximan para compararlas ó ser comparadas.

Un _número_ de seres, una _aproximación_ suficiente, una _comparación_ de sus cualidades, son condiciones indispensables para decir ó negar que hay igualdad. Ésta supone, pues, colectividad que juzga y resuelve si algunos, muchos ó todos sus individuos han de equipararse. Por pocos que éstos sean, la igualdad es un fenómeno _social_, y por groseros que se los suponga, la igualdad está precedida de una comparación, de un juicio.

En consecuencia, la igualdad, ya se afirme, ya se niegue, no se puede considerar en una cosa aislada: como quiera que se comprenda el modo de ser de una persona, no se la _iguala_ ó _diferencia_ por lo que en ella se observe en absoluto, sino por lo relativo que con otros tenga de común ó diferente. No siendo la igualdad personal, sino colectiva, tiene más fuerza y menos independencia que lo que depende del solo individuo; y si se conociera mejor, tendría menos osadía y menos desfallecimientos como un elemento positivo y coartado que no se puede extender indefinidamente ni suprimir.

La igualdad, como aspiración, existe en varios grados y formas, según el pueblo en que aparece y el individuo que á ella aspira; pero en ninguna circunstancia esta aspiración existe sola, sino con otras, ya del individuo que la siente, ya de los que con él están relacionados. El mismo que desea _igualarse_ con los que están más arriba, quiere _distinguirse_ de los iguales, y se indigna de ser _confundido_ con los inferiores. El espíritu de dominación, tan hostil al de igualdad, coexiste con él, y cuando no hay una fuerza que le sofoque, ó una razón que le enfrene, se revela: pueden verse sus tendencias avasalladoras en el niño que pretende imponer su voluntad, y más aún en el loco, que no sólo quiere que prevalezca la suya, sino que con frecuencia se reviste de autoridad superior ó poder omnipotente. Cierto que no se pueden aplicar á los hombres cuerdos las observaciones hechas en los niños y en los locos, pero tampoco pueden dejar de considerarse como datos; porque en el niño están los elementos del hombre; no ha dejado de serlo el loco por estarlo, y su extravío no consiste en tener instintos, facultades ó sentimientos que falten á los demás, sino en la preponderancia desordenada de alguno de ellos. La frecuencia con que los locos se creen personas muy superiores por sus riquezas, talentos ó autoridad, hace sospechar que existe en el hombre una propensión á elevarse sobre los otros, sospecha que pasa á convencimiento notando que la vanidad y espíritu de dominación son tan comunes en el hombre como hostiles á la igualdad. Si hay en el corazón humano un elemento que impulsa á _igualarse_, hay otro que induce á distinguirse, como se puede notar que existe á la vez el instinto del mando y el de la obediencia. Estos impulsos iniciales pueden y deben constituir una armonía: no se diga que son fatalmente hostiles, pero no se desconozca su antagonismo y se crea que la igualdad puede establecerse sin lucha y brotar espontáneamente donde quiera que no se contraría la natural propensión del hombre. Éste, por el contrario, propende á la desigualdad, porque es vano, porque quiere distinguirse, y para lograrlo sacrifica muchas veces su sosiego, su vida y hasta su deber. Desde la noble emulación que inspira al héroe en el campo de batalla y al sabio en su gabinete, al bestial arrojo del torero, y el artificio costoso de la coqueta elegante, hay un mundo de esenciales diferencias, pero se nota un factor común, el deseo de distinguirse; es tan fuerte este deseo, que anima al hombre en las circunstancias más varias de la vida;

sofoca el ¡ay! del enfermo que siente penetrar en sus carnes el cuchillo de amputación, y la voz de la conciencia de la mujer de moda se mezcla á los motivos nobles del hombre virtuoso y á los viles del criminal. Seguramente hay servidores, y aun mártires, de la religión, de la ciencia y de la humanidad, en quienes no influye el deseo de distinguirse y hacer que su nombre no se confunda con los otros, pero son excepciones; la regla general es que el individuo, siempre que puede, procura hacerse notable por alguna cosa; que si halla grados establecidos procura colocarse en los superiores, y que sólo los que están en el último piden nivelación. Hay, pues, que tener presente el hecho de que en lo íntimo de la naturaleza humana existe un impulso antagónico á la igualdad: el deseo de distinguirse.

Siendo el hombre un compuesto complicadísimo de elementos que se combinan de diversos modos, no es cosa sencilla y fácil de estudiar la igualdad: puede referirse á la fuerza, á la belleza física, á la resistencia para el trabajo, la fatiga, el dolor, y contra las causas que alteran la salud; á la nobleza ó vileza de carácter, á su entereza ó debilidad, á la actividad ó apatía, al cumplimiento ú olvido del deber, al egoísmo ó la abnegación, y, en fin, á las varias facultades intelectuales. Las aptitudes diversas, las variaciones combinadas de diverso modo, dan lugar á diferencias infinitas en lo físico, en lo moral, en lo intelectual. La igualdad y la desigualdad están constituídas por un gran número de igualdades y desigualdades que modifican y son modificadas: así como del _mismo_ peso ó estatura de dos hombres no se puede inferir su igualdad física, porque uno puede ser feo ó enfermo, otro bello y hermoso, tampoco por ninguna cualidad moral ó aptitud de la inteligencia se puede saber si será igual á otro que tenga aquella misma aptitud ó cualidad. Y como esto sucede, no sólo al comparar un individuo con otro, sino todos entre sí; como hay que ir reconociendo diferencias y combinaciones de ellas para conocer igualdades, este conocimiento es muy difícil, y muy común, careciendo de él, resolver como si se tuviera. El que habla resueltamente de igualdad, ¿puede responder siempre á esta pregunta? ¿De qué igualdad se trata? No; y la física, la moral y la intelectual constituyen clases muy diferentes, y dentro de ellas, variedades infinitas. Sólo clasificando estas diferentes especies de igualdad pueden conocerse, y sólo conociéndolas negar y concederse con razón.

Siendo los elementos de la igualdad físicos, morales é intelectuales, hay que tenerlos todos presentes para establecerla; si se prescinde de ellos, la igualdad es una palabra, un abuso de la fuerza, la ilusión que desaparece ó el rodillo que nivela aplastando lo que sobresale, jamás el equilibrio de una armonía duradera.

La igualdad tiene, sin duda, profundas raíces en el corazón humano; pero además de que halla otros espontáneos impulsos igualmente arraigados que la contrarían, ninguna planta vive por la raíz sola: no basta decir que una aspiración es natural para que sea realizable; al contrario, el hombre está lleno de aspiraciones que rara vez ó nunca realiza. No creemos que sean inútiles; pero no es éste el lugar de discutir cómo pueden utilizarse, sino de consignar que las aspiraciones no son, ni profecías, ni oráculos, sino impulsos que es necesario enfrenar, ó cuando menos dirigir. Para apreciar los grados de realidad que pueden tener las aspiraciones, cierto que ha de tenerse en cuenta la naturaleza humana, pero cuidando de distinguir que hay inmensas diferencias entre el _natural_ de un salvaje, de un bárbaro ó de un hombre civilizado, y aun dentro de la civilización, según sus grados, tendencias y lugar que en ella se ocupa, entre unos hombres y otros; de modo que, cuando se habla de conformarse á las aspiraciones naturales, es necesario investigar cuáles son, porque el natural varía.

Aun cuando la igualdad sea aspiración legítima y realizable, no puede prescindir del principio _no hay derecho contra el derecho_, ni afirmar que el suyo es el más sagrado, que no tiene límites fijos, que su uso no está sujeto al abuso, y, en fin, que puede sustituirse con una maza la balanza de la justicia. Pero desde que la igualdad es derecho, es sagrado como cualquier otro, indestructible como todos; y siendo preciado como pocos, y haciendo como ninguno fácil la alianza de la razón y las pasiones, negarle es tan imprudente como injusto.

De todo lo cual se infiere que la igualdad es un problema social de los más complicados y difíciles de resolver.

CAPÍTULO II.

DE LA IGUALDAD, DE LA IDENTIDAD, DE LA SEMEJANZA Y DE LA EQUIVALENCIA.

La igualdad sin diferencia alguna entre las personas, sabido es que no existe, y aun las cosas que no acertamos á distinguir no son idénticas. Si lo parecen las hojas de un árbol ó las arenas del mar, es porque no las observamos bien, ó porque no tenemos medios adecuados de observación: á medida que ésta se perfecciona más, halla más diferencias; tanto, que conocer es distinguir. Nos parecen iguales las ovejas de un rebaño que el pastor no confunde, y dos gotas de agua que ponemos como ejemplo de cosas idénticas, con el auxilio del microscopio se ve que no lo son.

Si la igualdad entre los hombres no es, no puede ser la _identidad_, resultará, pues, _de cierto grado de semejanza_. Pero ¿qué grados de semejanza bastan para constituir la igualdad? ¿Cómo se miden estos grados? Hé aquí dos preguntas que es preciso hacer y difícil contestar. Por difícil que sea hay que contestarlas, porque ya se conceda la igualdad ó se niegue, necesario es razonar la concesión ó la negativa: reflexionemos, pues, sobre el asunto.

Hay que poner ruedas á un vagón, y han de ser _iguales_. ¿Qué necesitamos para decir que lo son? No que sean idénticas, sino que su semejanza sea bastante para resistir igualmente por cierto tiempo, para que se adapten á la vía de un modo análogo, no tengan demasiado rozamiento al rodar por ella, no descarrilen en las circunstancias normales, y no produzcan movimientos violentos y grandes desniveles en los carruajes.

Necesitamos una balanza: los brazos, los platillos, han de ser iguales. ¿Cuándo decimos que lo son? Cuando tienen la suficiente semejanza para que los pesos que hacemos con ella tengan la necesaria exactitud. Según tengamos que pesar patatas, oro ó gases, exigiremos entre las partes simétricas del aparato más igualdad, grados de semejanza proporcionados á los de exactitud que deseamos en el peso.

Necesitamos varios aparatos para elevar agua, iguales, y decimos que lo son cuando los cuerpos de bomba y los émbolos tienen bastante semejanza para efectuar próximamente el mismo trabajo.

Construímos una escalera con peldaños, que tenemos por iguales si á la vista lo parecen, asemejándose bastante para que al andar por ella no se tenga la molestia que resultaría de su mucha desigualdad.

Podrían multiplicarse los ejemplos, resultando siempre que en las obras materiales se llama igualdad cierto grado de semejanza.

Debe observarse, además, que tácita ó expresamente se prescinde, al calificar de iguales las cosas, de diferencias que, aun cuando grandes, no influyen de una manera apreciable en su utilidad para el servicio que han de prestar. Así, decimos que dos bombas son iguales si tienen las mismas dimensiones y efectúan el mismo trabajo, aunque estén pintadas de un color diferente.

Si de las obras pasamos á los operarios, observaremos que éstos se califican también de iguales cuando sus productos se asemejan lo bastante para ser igualmente útiles. Llamamos iguales á dos zapateros que nos hacen por el mismo dinero botas que no difieren de un modo apreciable en apariencia y servicio.

Pero en cuanto pasamos de la _obra_ al _obrero_, surgen multitud de elementos que hacen el problema complicado, de sencillo que era. En la balanza podíamos prescindir de todas las diferencias que no influyesen para la exactitud del peso; en el zapatero no podemos prescindir de todas las que no se refieran á la hechura de las botas. Puede ser un hombre que padece una enfermedad contagiosa transmisible por el calzado que manipula; un tramposo que pide paga anticipada y olvida ó niega la que ha recibido; un ratero que echa mano y guarda el cubierto ó la joya que halló al paso en nuestra casa; un criminal que entra en ella para combinar, con otros malvados, el modo de asaltarla. ¿Puede parecemos igual al que está sano de cuerpo y es exacto en sus cuentas y honrado en sus procederes? Seguramente que no.

Si en vez de calzar se trata de enseñar á un hijo, todavía notaremos más diferencias importantes entre dos maestros iguales respecto á ciencia, y habilidad y celo en transmitirla. No nos basta ya que no sean tramposos, ni cometan ninguna acción penada por la ley; necesitamos que sus maneras sean cultas, su lenguaje decoroso, su proceder digno, su conducta intachable, á fin de que no dé mal ejemplo, haciendo más daño con su obra inmoral que provecho con su obra científica: en este caso la igualdad necesita mucho mayor número de semejanzas. Estas han de ser más para que haya igualdad entre dos amigos.

Podemos decir (y con exactitud muchas veces) que nos son iguales dos operarios que trabajan del mismo modo; mas para afirmar la misma igualdad en dos personas que aspiran á la mano de una hija, ¡cuánto mayor número de semejanzas no necesitamos! La comparación se extiende entonces á lo físico, á lo moral, á lo intelectual. Edad, robustez, belleza, costumbres, ideas, carácter, aptitud, posición social, todo lo comparamos, observando analogías y diferencias, inconvenientes y ventajas, perjuicios y compensaciones; son aquí tantas las semejanzas que se necesitan para establecer la igualdad, que será muy raro que un padre, aun obrando con fría razón y recta conciencia, sin dejarse llevar de simpatías ciegas, ni vanidades locas, piense que es igual un hombre á otro para marido de su hija.

Se ve que en las relaciones de los hombres, aun las más sencillas y del orden físico, aun para la obra más mecánica, la igualdad que se establece no es puramente material; y se ve también que entran en ella más elementos físicos, morales é intelectuales, á medida que la relación se establece en más amplia esfera, aumentando entonces el número de semejanzas necesarias para

constituir igualdad.

Parece, pues, bastante claro que al contestar á la pregunta: _¿Qué grados de semejanza se necesitan para establecer la igualdad?_, no podemos referirnos á escala y números fijos, ni aplicar la misma regla comparando balanzas y escaleras, que hombres, ni éstos lo mismo si se trata de hacer calzado ó la felicidad de las personas que amamos.

De todo lo cual se infiere que _igualdad es aquel grado de semejanza_ NECESARIA _para el fin á que se destinan las cosas ó personas que se comparan_. Ya sacaremos las consecuencias de este principio, á nuestro parecer muy importante.

¿Qué es _equivalencia_? La etimología de la palabra lo indica: _equivalente_ es lo que _vale igual_. La igualdad aquí se refiere, no á la naturaleza de la cosa comparada, sino al aprecio que de ella se hace, al valor que tiene. Una moneda de oro, una medida de trigo, una pieza de paño, un pedazo de hierro, cosas son que se parecen muy poco entre sí, y, no obstante, pueden ser equivalentes, cambiarse unas por otras, y tomarse indistintamente como pago de una deuda. La equivalencia de las personas se establece según condiciones que varían mucho más que respecto á las cosas: las circunstancias, los errores, las pasiones, la abnegación, el egoísmo, el vicio, la virtud, el crimen, la inocencia, todo contribuye á que una persona sea tenida en poco ó en mucho, y á que se considere que vale más, menos ó lo mismo que otra con quien se la compara.

Menos fuerza muscular puede suplirse con mayor destreza; una cualidad moral, una aptitud intelectual con otra ó con mayor perseverancia en el trabajo y constancia para el bien. Aunque no se suplan las disposiciones ó las obras, pueden éstas tener un valor igual y ser equivalentes. Un albañil y un cantero no se suplen, ni un cantante y un director de orquesta; pero siendo igualmente necesarios éstos para ejecutar una ópera y aquéllos para hacer una casa, dadas ciertas circunstancias su trabajo podrá tener un valor igual, y sus servicios considerarse como equivalentes. Un médico y un abogado no se suplen en lo relativo á su profesión, pero los servicios que prestan, aunque muy diversos, pueden valer lo mismo. La muerte del que la arrostra voluntariamente por la patria en el campo de batalla, ó por la humanidad en una epidemia, con ser muy distintas son igualmente heroicas. Hay equivalencias en el arte y en la industria, en lo intelectual y en lo moral, en todo.

Pero estas equivalencias, ¿qué grados de _analogías_ necesitan? Aquí empieza la gran dificultad; porque un valor, cualquiera que sea, es cosa relativa á los medios, necesidades é ideas de quien le calcula y determina, y dos cosas análogas y equivalentes para uno, para otro no tienen analogía, ni pueden ser comparadas, ó si lo son es para apreciarlas de muy diferente modo. El entusiasta por la música y el que la considera como un ruido menos desagradable que otros; el aficionado á toros y el que detesta esta diversión, ¿podrán ponerse de acuerdo sobre la _equivalencia_ de los servicios que presta un torero y un cantante? El que llama sueños á las especulaciones filosóficas, y el que cree no hay elevación ni dignidad sino en ellas; el que no considera como verdadero trabajo sino al manual, y el que le califica de degradante, ¿podrán convenir en la equivalencia de la obra de un filósofo y de un picapedrero?

Es un gran auxiliar de la igualdad la equivalencia; por medio de ella pueden ponerse al _mismo nivel social_ los que tienen aptitudes, méritos, posiciones diferentes, estableciendo compensaciones armónicas y durables en vez de esas especies de rodillos que quieren pasarse por la sociedad como por las carreteras para igualar por presión, aplastando todo lo que sobresale. El que observa la variedad de aptitudes que especifica y aumenta la división de trabajo, y duda tal vez de poder hallar bastantes semejanzas para establecer la igualdad, ve un modo de suplir á la semejanza con la equivalencia, y se apresura á señalarla como poderoso elemento de equilibrio estable. Y como el ánimo al discurrir sobre los grandes problemas sociales es raro que no esté inquieto; como el asunto es carne viva que palpita, que siente, que sufre; como estas palpitaciones y estos sufrimientos se comunican al que los estudia con deseo de calmarlos, cuando se halla ó se cree hallar un calmante, es difícil que al desear su eficacia no se exagere.

Fácil es, por tanto, caer en exageración al graduar lo que al equilibrio social puede contribuir la equivalencia; mas sin considerarla como una panacea, parécenos que puede calificarse de remedio en algunos casos, y siempre de elemento armónico de razonable igualdad. Al congratularse de que exista, y al contar con él, hay que precaverse de exagerar su poder, y, sobre todo, de no imaginar que es independiente. La equivalencia puede penetrar muy adentro en el organismo social, pero no influir sin ser influída, y sin un previo, largo y difícil trabajo para calmar pasiones, desvanecer errores, satisfacer intereses y hacer concurrir al bien elementos cuyas armonías no se sospechan al ver sus aparentes antagonismos.

Pero si parece indudable que la equivalencia puede contribuir de un modo eficaz á establecer la igualdad, tampoco tiene duda que su cooperación ofrece dificultades cuya magnitud conviene apreciar bien, para que no se conviertan en insuperables obstáculos. Por una parte, si pueden ponerse al mismo nivel, no sólo los que son iguales, sino también aquellos que valen igualmente, claro es

que aumenta el número de personas que se igualaron, socialmente consideradas; pero este aumento requiere condiciones difíciles, es más dificultoso determinar equivalencias que igualdades. Comparar dos médicos entre sí, un médico con un naturalista ó un abogado, un poeta con un piloto, un ingeniero con un albañil, un artista con un artesano, ofrece dificultades crecientes á medida de las diferencias: ya no se buscan semejanzas que se llaman igualdades, hay que observar analogías para determinar equivalencias. Este trabajo se ve claramente es mucho más delicado y difícil, aunque se hiciera con toda calma, despreocupación y justicia; pero suele faltar esta justicia, esta despreocupación, esta calma, y suele medirse el valor de las diferentes clases como miden la temperatura los que no tienen termómetro, y según sienten calor ó frío, dicen que una casa está fría ó caliente. ¿Qué escala, qué regla hay para graduar las equivalencias sociales? Si no nos pagamos de palabras y de apariencias, veremos que no existen reglas fijas; y reflexionando sobre el caso, notaremos que las escalas es inevitable que sean variables con las ideas, las pasiones, las necesidades y la manera de ser de los que las forman. El pueblo guerrero y descreído no puede conceder equivalencia entre el combatiente impávido y el piadoso sacerdote; el ignorante y vicioso, entre el sabio que le quiere instruir y el cómico, el cantante ó el torero que le divierten: donde se cree en la diferencia real de las castas y de las clases, no hay equivalencia posible entre los que figuran en las primeras y los que pertenecen á las últimas. Cada cambio en las ideas, en los intereses, en las necesidades, en las pasiones, produce otro en la escala que gradúa el valor social de los hombres; se establecen equivalencias donde antes no podían existir, se niegan las reconocidas, y se declara superior al que antes estaba más abajo, y viceversa. Mirados con desprecio los que toman parte en las representaciones teatrales, su oficio es vil, y ellos equiparados á los más indignos; pasan años, no muchos, para tan notable cambio, y el que era un histrión infame se convierte en un actor, en un artista apreciable, eminente, sublime, inmortal, según los casos, y la equivalencia que antes se buscaba en las últimas capas sociales, se establece en las primeras.

Un gran número de artes y oficios vedados por la ley ó por la opinión á toda persona digna, y hoy apreciados ú honrados, han variado la graduación de la escala y los elementos de la equivalencia. Estudiándolos se ve que crecen estos elementos, que cada descubrimiento, cada invención, cada camino que se abre á la actividad inteligente del hombre, es un nuevo medio de equipararle á otros que ocupaban una posición más aventajada, y aumenta el número de los que, siendo equivalentes, pueden ser y son considerados como iguales: la rapidez del progreso en este sentido no puede desconocerse. No es necesario subir mucho en la historia de los pueblos para ver que no había equivalencia social respecto á las clases elevadas más que en dos: el sacerdote y el guerrero. Entre éstas y las demás mediaba un abismo; la equivalencia era imposible. Después la toga se equiparó al hábito y á la coraza; así pasó mucho tiempo, y aún los ancianos recuerdan aquel en que ninguna persona noble que no tuviera lo suficiente para vivir de sus rentas podía dedicarse más que á las armas, á la iglesia ó al estudio de las leyes: la equivalencia, que se había extendido un poco, se limitaba, no obstante, al derecho, la teología y la milicia; hoy han dilatado su esfera las ciencias, las artes, la industria, el comercio, modos infinitos de desplegar dignamente la actividad humana, que, manifestándose de diferente modo y aplicándose á objetos diversos, tienen igual utilidad y merecen igual aprecio.

No es posible observar, siquiera sea muy por encima, la marcha de la civilización sin ver como factor creciente de la igualdad la equivalencia, y sin notar que este crecimiento es constante, graduado, sólido, resulta de causas poderosas y permanentes, es lógico, en fin.

Pero quien dice lógica, dice encadenamiento ordenado y necesario de verdades, dice un inmenso poder y una regla severa, una gran fuerza y una estrecha sujeción, y para que las consecuencias sean irresistibles es indispensable que las premisas sean ciertas. No es una escuela, un club, un orador de tribuna ó de esquina los que pueden decir á un hombre ó á una multitud tú vales tanto como otra multitud ú otro hombre: esta declaración puede hacerse aplaudir en una hora da entusiasmo, ó servir de bandera en un día de motín; pero no constituirá un derecho si no recae sobre hechos positivos y constantes. Nuevas ideas, nuevas necesidades físicas, morales é intelectuales, y quien las satisfaga realmente, es condición precisa para aumentar de un modo estable el número de los equivalentes sociales, ó variar el lugar de la escala que ocupan. La adivinación no se ha convertido en buenaventura descendiendo del oráculo á la gitana, sino porque son ya pocos y de los que están muy abajo los que creen que hay artes ocultas para predecir lo futuro. El ingeniero no se ha puesto á nivel de las profesiones más honradas sino porque satisface una necesidad generalmente sentida. El cómico no pasó de histrión infame á actor apreciado sino porque se ha hecho artista en un pueblo que gusta del arte; y donde el torero recoge aplausos y dinero, y el filósofo vive olvidado en la miseria, es porque la falta de ideas y el trastorno de las pocas que hay produce la inversión de las escalas sociales y que los últimos sean los primeros, y viceversa.

Así, pues, la equivalencia, auxiliar poderoso de la igualdad, crece constante pero lógicamente; tiene poder, pero está sujeta á leyes; puede influir mucho, pero no puede prescindir de necesidades, de ideas y, lo que es más triste, ni aun de errores é

injusticias. En vano un individuo ó una colectividad dirán á otra colectividad ó á otro individuo: valemos tanto como vosotros, y será cierto y lo probarán; si los demás no lo comprenden así, si hay quien tiene interés en negarlo y medios de hacer que su interés prevalezca, la equivalencia, por más justa que sea, no será menos imposible. No la realiza, pues, quien pretende imponerla; antes la desacredita, contribuyendo á que se la declare imposible, cuando no es más que prematura.

Resumiendo. No se debe confundir la igualdad con la identidad, porque no existen dos personas entre las cuales no haya diferencia alguna.

Igualdad no es una cosa absoluta y fija, sino relativa y variable, según el objeto con que se establece; así hemos podido definirla _aquel grado de semejanza necesario para el fin á que se destinan las cosas ó las personas comparadas_.

Equivalencia es el valor igual que tienen las cosas ó las personas, no por sus muchos grados de semejanza, _sino por ser igualmente apreciadas del que las califica_.

Tendremos ocasión de recordar más adelante estas verdades y necesidad de apoyarnos en ellas.

CAPÍTULO III.

ORIGEN Y PROGRESOS DE LA DESIGUALDAD.

Es tan cierto lo que decíamos en nuestro primer capítulo, de que sin haber observado diferencias no habría ocurrido pensar en igualdades, aquéllas y éstas están en relación tan constante, íntima y necesaria, que al estudiar la igualdad hallaremos de continuo la desigualdad, sin que nos sea posible hacer investigaciones sobre la una, sin analizar la otra, y anotando que, bien definida cualquiera de ellas, es fácil definirlas entrambas con exactitud.

Si la IGUALDAD _es aquel grado de semejanza necesaria para el fin á que se destinan las cosas ó las personas que se comparan, la_ DESIGUALDAD _será aquel grado de diferencia por el cual las cosas ó las personas no puedan servir igualmente al mismo fin_.

El origen de la desigualdad del hombre, que es la que nos proponemos estudiar, está en la naturaleza, entendiendo por naturaleza del hombre no sólo su organismo físico, sus necesidades materiales y los medios de satisfacerlas, sino su sér completo, físico, moral é intelectual.

Sin dejarse llevar de la imaginación ó del espíritu de sistema afirmando acerca del hombre prehistórico lo que no puede saberse, cabe asegurar que los primeros hombres no eran iguales entre sí, en el sentido de ser idénticos, ni aun tenían todos aquel grado de semejanzas en virtud del cual sirvieran igualmente á cuantos fines pudiesen proponerse en la sociedad más ruda.

Para evitar equívocos convendrá consignar que entendemos por hombre un viviente físicamente organizado en lo esencial, como lo están los hombres de hoy: intelectualmente, capaz de distinguir el bien del mal; y moralmente, con poder de elegir y realizar el uno ó el otro. El que no tenga estas condiciones podrá ser hombre para el naturalista, pero no lo es para el que se ocupa de ciencias morales y políticas.

Entre los primeros hombres los habría deformes, feos, débiles, enfermizos, y bien constituídos, bellos, fuertes, robustos; estas desigualdades físicas, por ser las más perceptibles y las más importantes entre hordas salvajes, no serían las únicas; individuos habría más resueltos para buscar el peligro, más firmes para arrostrarle, más circunspectos, más valerosos, más astutos para triunfar en la lucha continua que era condición de existencia. Que entre ellos había desigualdades se comprende desde luego observando que existen hasta entre los animales, y más á medida que ocupan un lugar más elevado en la escala. Entre los domésticos, que son los que conocemos un poco mejor, podemos notar diferencias de belleza, de fuerza, y hasta de inteligencia y de carácter; no se concibe, pues, que dejen de existir entre los hombres, ni se ha encontrado sociedad por ruda que sea en que algunos no se distinguieran de los otros, ya fuese por elevarse, ya por no llegar al nivel común. No hay pueblo sin jefe, ni donde la tradición no recuerde algunas personas distinguidas. Que se los suponga venidos de remotas regiones ó descendientes de los dioses, es lo cierto que se conserva el recuerdo de hombres que no eran iguales á los otros, que inventaron artes útiles, llevaron á cabo heroicas hazañas ó las cantaron.

Por rudo que sea el hombre primitivo, por decisivas que sean para él las inferioridades y superioridades físicas, también le importan en cierta medida, al menos, las intelectuales, porque además de la fuerza muscular necesita alguna inteligencia á fin de utilizarla. Un genio enfermizo no tendría autoridad en un pueblo bárbaro, pero tampoco un atleta imbécil.

Por todo lo que pensamos, observamos y sabemos, donde quiera que hay sociedad de hombres se notan en ellos desemejanzas bastante marcadas para que sean calificadas de desiguales, ya se compare su fuerza, ya su inteligencia. Estas diferencias son necesarias, sin que puedan evitarlas aquellos á quienes perjudican, ni conseguirlas aquellos á quienes favorecen. No depende de nadie nacer feo ó hermoso, enfermo ó robusto, limitado ó inteligente; todas estas desigualdades naturales son también fatales.

Aunque sea de paso, debemos advertir que decimos _fatal_ en el sentido de _inevitable_, no en el de _ciego_ y menos de _injusto_. En cualquiera época que estudiemos á los hombres hallamos desigualdad natural entre ellos, lo cual en parte se explica como necesario á la sociabilidad, y en parte no. En todo estudio se llega á un _non plus ultra_; se encuentra lo desconocido, lo inexplicable, que unos dan por explicado sin estarlo, otros llaman misterio, y otros absurdo ó injusticia: nosotros somos de los que le llamamos misterio. Le hay en la desigualdad congénita de los hombres; cuando es, será porque debe ser; pero aun los que no vean en ella la justicia divina, no pueden negarse á la evidencia de que está en la naturaleza humana. Providencial ó fatal, es innegable la desigualdad de los hombres de todos los tiempos y lugares; y cualquiera que sea el grado de su cultura, ésta modifica, no destruye el hecho primitivo de las grandes diferencias individuales.

Pero el hombre no es sólo un organismo físico, un conjunto de facultades intelectuales, sino también un sér moral; además de bello ó feo, endeble ó fuerte, limitado ó inteligente, puede ser _bueno_ ó _malo_, y el serlo depende de él, de él solo; no hay aquí fatalidad; todo el que hace mal, si está en su cabal juicio, es porque quiere hacerlo. En cualquier lugar donde existen hombres los hay malos y buenos, peores y mejores; toda colectividad que tiene recuerdos, conserva la memoria de bondades ejemplares, de virtudes á toda prueba, de abnegaciones sin límites, al propio tiempo que necesita reprimir hechos atentatorios al orden y que, si se generalizasen, harían imposible la sociedad. El excepcionalmente bueno y el excepcionalmente malo, el que se reverencia con amor y el que se persigue con odio, el justo y el delincuente, son los extremos de la desigualdad moral, cuyos intermedios varían al infinito. Pero si las diferencias físicas é intelectuales se reciben, las morales se crean, su origen está en la libertad del hombre, en su voluntad recta ó torcida.

Son tres los elementos (físico, intelectual y moral) que entran en la desigualdad; de los dos primeros no se dispone, del último sí, y con él puede reaccionar de tal modo sobre los otros que venga á ser preponderante en vez de estar supeditado. ¿Quién no conoce personas que por falta de moralidad han destruido un físico fuerte, y otras delicadas que se han fortalecido con la constancia en un buen régimen que no es posible sino á los que tienen buena conducta? Por donde quiera se ven ejemplos de ventajas conseguidas respecto á los que nacieron mejor dotados, de desigualdades físicas invertidas por la moralidad ó la falta de ella; de modo que en muchos casos, aun aquellas dotes que parecen recibidas fatalmente, pueden conquistarse con la voluntad recta y perderse con la voluntad torcida; lo último, sobre todo, es indefectible; la organización más privilegiada no resiste al desorden y al vicio, que no tarda en rebajar á los que la Naturaleza había elevado al nacer.

Aunque no tan grande como la robustez, la belleza es una gran ventaja que está muy desigualmente distribuída. ¿Pero puede conservarse la belleza que se _recibe_ sin la moralidad de que se dispone? ¿Cuánto tiempo dura la belleza del hombre crapuloso, de la mujer liviana, del malvado, en cuyo rostro contraído no tardan en reflejarse sus pensamientos siniestros? Poco dura, fugaz es, y ellos muy pronto inferiores, aun estéticamente considerados, á los que tienen la hermosura del alma. El efecto útil de la belleza para el que la tiene, es la impresión que produce. ¿Y quién no sabe que esta impresión depende muchas veces menos de las dotes físicas recibidas que de las morales consecuencia de la voluntad? ¿Quién no conoce personas que no son hermosas, y hasta que son feas, pero que, no obstante, agradan, son simpáticas, porque la dulzura del carácter, la bondad del corazón, la paz del espíritu, la rectitud de la conciencia, se revelan en el rostro, cuyo atractivo no está en las formas, ni en el color, sino que es un reflejo de la belleza del alma? _Son feos porque quieren_, decía uno con gran asombro de los que no comprendían cuanta verdad hay en esta frase; variándola un poco, diciendo:--son _desagradables_ porque quieren--puede sostenerse su exactitud, porque el que tiene voluntad de ser bueno lo es, y siéndolo, no habrá en su aspecto exterior nada repulsivo, y, por el contrario, tendrá siempre algo que agrada y atrae.

De otras desventajas físicas triunfa también la voluntad fortaleciendo con el ejercicio órganos débiles y utilizando con la perseverancia aptitudes que sin ella habrían sido inútiles.

En el orden intelectual aparece aún mucho mayor el poder de la voluntad; y aunque no sea absolutamente cierto, como se ha dicho, _que el genio es la paciencia_, es decir, la perseverancia, es decir, la voluntad, sin ella muy firme no hay genio. Nadie nace genio. Pueden recibirse al nacer facultades superiores; pero si no se cultivan, se atrofian, sucumben en germen por falta de una voluntad firme y recta.

En general, los hombres grandes son hombres morales, y muchos que hubieran sido eminentes se quedan en medianías por falta de moralidad. No sólo el vicio debilita las facultades; no sólo el amor propio exagerado, la vanidad, la codicia, todas las formas del egoísmo limitan el horizonte, dan puntos de vista mezquinos, impiden elevarse á las grandes alturas desde donde solamente se descubre la verdad, sino que sin amor á ella, sin impulsos nobles, grandes, que destruyan los miserables movimientos del yo mezquino, es difícil la inspiración sostenida que constituye los grandes hombres. Porque la inspiración no se limita á los artistas y á los poetas; sin ella nada grande se crea, se comprende ni se adivina, é inspirados estaban Platón, Leibniz, Copérnico y Watt, como Homero, Milton y Murillo. Sin trabajo, sin energía no hay inspiración posible; y como el trabajo es obra de la voluntad, y cuando ésta se tuerce viene la perversión que degrada y debilita, resulta que hasta en el genio, que es la aptitud excepcional que requiere más dotes naturales que se reciben desigualmente al nacer, hasta en el genio influye poderosamente, á veces de una manera decisiva, el elemento moral: hay muchos hombres que nacieron con facultades eminentes, y para ser grandes no les ha faltado más que ser buenos, y otros que, por serlo en sumo grado, se elevan más que ellos con menos dotes naturales.

Pero dejando al genio, que es la excepción rara, y viniendo al talento y á la inteligencia que, sin llegar á él, tienen mayor ó menor el común de los hombres, ¿quién no ve cómo influye en su desarrollo y aprovechamiento la voluntad de cultivarla y el modo de dirigirla? No es necesario extender mucho la vista; en derredor y muy cerca pueden observarse aptitudes inútiles ó que por culpa suya ha vuelto contra sí el mismo que las tenía, y facultades comunes, y aun limitadas, que ha utilizado grandemente el trabajo y la perseverancia. Si el genio es _poder_ y _querer_, la inteligencia del común de los hombres es principalmente _querer_, y las desigualdades que en ellos se notan son, por lo general, consecuencia de la voluntad torcida ó recta, débil ó fuerte, que rehuye el trabajo ó persevera en él, que da el tónico de la buena conciencia ó el debilitante deletéreo de la perversión. Es frecuente ver personas que han adquirido una reputación ó una fortuna, que se han distinguido sin tener dotes naturales superiores, y por sólo el resorte moral de una conducta ordenada, de un trabajo perseverante; y es asimismo grande el número de los excepcionalmente aptos y dispuestos, que gráficamente se llaman _perdidos_, y que, en efecto, pierden las facultades de que no usan ó que emplean en su daño.

Verdades son éstas que todo el mundo sabe, por lo cual no hay para qué insistir en ellas, y sí sólo en las consecuencias que deben sacarse; éstas nos parecen muy importantes, por lo que no estará mal repetirlas y determinarlas bien; pueden formularse así:

El hombre se compone de elementos físicos, morales é intelectuales;

Los intelectuales y los físicos los recibe al nacer con una desigualdad que no está en su mano evitar;

Los morales son obra suya; puede ser bueno ó malo, mejor ó peor, según quiera; en la esfera moral la desigualdad es obra suya, y en ella no se rebaja sin culpa, ni se eleva sin mérito.

Pero en la unidad armónica que constituye la persona humana, los elementos intelectual y físico reciben poderosas influencias del moral; de modo que el hombre no sólo _puede_ ser bueno ó malo porque _quiere_, sino que su voluntad influye poderosamente en su fuerza física, en su robustez, en su belleza y en su inteligencia.

Los elementos intelectuales y físicos que fatalmente parecen establecer una inevitable desigualdad, están neutralizados por el elemento moral que no pasa un nivel ciego aplastando lo que sobresale, sino que ordena justas compensaciones, suprime naturales desigualdades y establece otras que son consecuencia de una voluntad firme ó débil, torcida ó recta, y parecen premios merecidos y castigos justos.

Así, pues, aquella desigualdad congénita que parecía tan grande y tan fatal, observada de cerca no es tan fatal, ni tan grande; porque además de ser en parte necesaria para la armonía social, en parte está condicionada moralmente: no es el destino ciego que eleva ó rebaja, sino una ley en virtud de la cual pueden descender ó sobresalir, según quieran emplear bien ó mal las facultades recibidas.

Esto no es decir que siempre suceda así, ni que muchas veces no suceda lo contrario. Hay organizaciones tan débiles que el régimen más severo no fortifica; deformidades cuya fealdad no puede dejar de ser repulsiva; entendimientos tan cortos que no logra poner al nivel común el trabajo más perseverante; y dolores terribles de noble origen que contraen el rostro y le desfiguran: la voluntad, que basta siempre para ser bueno, no en todas ocasiones tiene poder bastante contra un físico enfermizo ó desagradable ó una inteligencia muy limitada. Es innegable, pues, que hay desigualdades congénitas inevitables, dichosas para unos, desdichadas para otros; hay misterio en esta desigualdad original: este es un hecho; pero no debe exagerarse su

importancia, ni darle más alcance del que tiene, ni dejar de ver, al lado del elemento _fatal_ de la desigualdad, un correctivo en la voluntad del hombre y su libre albedrío, que condiciona moralmente inconvenientes y ventajas que parecían haberse recibido sin condición alguna.

Así, pues, al estudiar la desigualdad la vemos desde su origen resultar de las diferencias congénitas de los hombres, fatales para ellos, pero condicionadas por el elemento voluntario de la voluntad libre. Y esto es tan cierto, tan esencial de la naturaleza humana, que en las hordas salvajes, en los pueblos bárbaros, en las naciones civilizadas, donde quiera que estudiemos la igualdad, veremos siempre el fatalismo modificado, neutralizado ó vencido por el elemento moral, que en ningún caso deja de ejercer grande influencia en el modo de establecer las jerarquías sociales ó de suprimirlas. La pasión ó el espíritu de secta ó de escuela, ni el delirio de las iras populares, no son los que nos dan niveladores tan ciegos é insensatos como ellos, sino que la naturaleza humana, y á nuestro parecer la voluntad divina, nos ofrece compensaciones para las diferencias y medios de realizar la igualdad en el elemento moral, en la voluntad y libre albedrío del hombre.

El origen de la desigualdad, en parte misteriosa, en parte de fácil explicación, fatal en alguna manera y hasta cierto punto consecuencia de la voluntad del hombre, está siempre en la naturaleza humana, y, por tanto, puede variar en sus grados y formas, pero no desaparecer.

¿Y la desigualdad aumenta ó disminuye con la civilización? ¿Sus progresos están en razón directa ó inversa de los del pueblo donde se estudia?

Los primeros progresos de las sociedades deben ser desfavorables á la igualdad, y podrá favorecerla ó perjudicarla una civilización más adelantada, según circunstancias que varían casi al infinito: tal vez podría decirse, respecto á la cultura de los pueblos, que la igualdad está en los extremos, y en medio la desigualdad; pero si esto se estableciera como regla tendría demasiadas excepciones, que, bien estudiadas, pondrían de manifiesto la influencia del elemento moral que hemos señalado.

La igualdad debe estar en su máximo grado en los pueblos salvajes. En lo físico, los débiles perecen al nacer ó en la infancia; hay un mínimum muy elevado de robustez y de fuerza indispensable para vivir: los que tienen menos sucumben; sólo pueden distinguirse los que tienen más. No viviendo los lisiados, enfermizos, enfermos ni deformes, disminuyen los elementos de la fealdad, y tampoco tiene muchos la hermosura en medio de una existencia materialmente tan penosa y con tan escasos recursos para embellecerse: esto no es decir que todos sean igualmente fuertes y bellos; pero están muy limitadas las diferencias físicas, y en su grado máximo la igualdad.

En lo intelectual, la esfera de acción se halla también muy reducida: ni artes, ni ciencias, ni industria, ni comercio; ninguno de los infinitos medios que sirven para poner de manifiesto la diferencia de aptitudes y la superioridad de facultades. Más destreza, más astucia para la caza, mayor disposición para las empresas de la guerra, un poco más ó menos de arte para preservarse de la intemperie ó arrostrarla con menor peligro, son los únicos modos de diferenciarse por debajo ó sobre el nivel común.

La esfera moral tiene también límites estrechos: son imposibles la mayor parte de los vicios de la civilización y las opuestas virtudes. No hay bebidas con que embriagarse; el trabajo, que es condición de vida, y el cansancio, que hace necesarias largas horas de reposo, disminuyen las del ocio. Lo rudo de la vida y la escasez de alimentos ponen límites á la incontinencia, y la general pobreza á los ataques á la propiedad: los de las personas tienen rara vez objeto, y siempre peligro, entre hombres á quienes pocas veces se puede robar, y que, fuertes y habituados al peligro, se defienden valerosamente. No habiendo apenas goces, la tentación de gozar no impulsa á apoderarse de lo ajeno; el egoísmo tiene carácter más negativo; las pasiones feroces apenas hallan freno, y es posible satisfacerlas igualmente sin reprobación, y antes con público aplauso. Son imposibles y no existe siquiera idea de la mayor parte de las virtudes, y apenas hay ni se concibe más que la fortaleza para sufrir el dolor y arrostrar la muerte. Este modo de ser como encadenado por las necesidades físicas, por la dificultad de satisfacerlas; esta limitación de ideas, han de dar cierta uniformidad á los afectos y á las determinaciones. Sin duda que desde luego serán diferentes; sin duda habrá personas mejores y peores, de carácter más débil y más firme, de voluntad más ó menos enérgica, más ó menos recta, más ó menos incontrastable; pero todas las diferencias se encerrarán en un círculo muy limitado. Los goces, como las privaciones, se parecen; el dolor y el placer tienen una generalidad uniforme, que difícilmente da lugar á la envidia ni á la compasión, al daño ni al consuelo: cuando unos tienen hambre ó frío, los otros padecen de frío y de hambre; cuando unos carecen de albergue, los otros no le hallan; cuando unos se ven en peligro, lo están los otros también. En aquel estado en que los hombres se ven obligados, por una necesidad _absoluta_, á tener un género de vida _idéntico_, no deben aparecer apenas las diferencias naturales que, cual semillas en terreno impropio para que germinen, desaparecen sin haberse desarrollado. Como Chateaubriand saludaba en el

cementerio de aldea _á los héroes sin victoria_, en las tumbas de un pueblo primitivo podrían saludarse ambiciosos sin poder, filósofos sin ideas, poetas sin lira: en semejante estado social, la igualdad está en su grado máximo.

Apenas el hombre trabaja con más perfección, de modo que no necesite estar trabajando siempre, aquella necesidad imperiosa ciegamente niveladora disminuye. El más hábil, el más previsor realiza algunas economías, tentación para el que no las tiene, recurso para el que por medio de ellas puede entregarse á un reposo fecundo. Aparecen el malhechor que se apodera de lo ajeno, el vicioso que se entrega á una brutal sensualidad, el que extasiado contempla los sublimes espectáculos de la Naturaleza, el que observa ó adivina las leyes del mundo físico, y el que desciende á lo íntimo de su sér, á su conciencia y á su corazón, para investigar las del mundo moral. Tan pronto como los hombres dejan de estar apremiados por necesidades imprescindibles é idénticas, empiezan á rebajarse los unos, á elevarse los otros. Uno contempla el cielo, observa los movimientos de los astros y es el primer astrónomo; otro quiere fertilizar la tierra, inventa un instrumento para removerla y es el primer mecánico; aquél entra en sí mismo, y se pregunta quién es y cómo es, observa la creación, busca al Creador y es el primer filósofo. A medida que los conocimientos se acumulan, se multiplican, se diferencian mayor número de facultades ó todas entran en actividad, y las desigualdades se marcan más cada vez. Hay sabios é ignorantes, héroes y criaturas viles, criminales y santos. La necesidad general del trabajo continuo é idéntico para no perecer de hambre, era como un punto céntrico del cual no era posible alejarse mucho; pero á medida que el pueblo se civiliza, el círculo se ensancha, los radios se multiplican y extienden, y los hombres que marchan en direcciones opuestas se alejan cada vez más.

Pero este aumento de la desigualdad con el de la civilización no es graduado; no se verifica en virtud del desarrollo desigual de facultades diferentes; no concurren á él en proporciones razonables los elementos físico, intelectual y moral que constituyen el hombre que reposada y equitativamente se eleva ó desciende, según que ha recibido mayores dotes ó las aprovecha mejor. Desde los primeros albores de la vida de los pueblos se ve una causa permanente y poderosa, subversiva del orden y de la justicia, que no se tiene en cuenta para elevar y rebajar: esta causa de desigualdades establecidas _ab irato_, es la guerra.

La guerra, respecto al asunto que nos ocupa, es subversiva del orden principalmente en tres conceptos:

Por el modo de calificar á los hombres para elevarlos y rebajarlos;

Por los medios empleados para elevar;

Por la escala que establece para los de arriba y para los de abajo, ó más bien por el abismo que abre entre unos y otros.

La guerra no pedía al hombre para elevarle una superioridad verdadera, que consiste en la armonía de sus facultades y en la superioridad de algunas: fuerza física, valor y alguna destreza para utilizarle era todo lo que necesitaba para sobreponer un individuo ó un pueblo respecto de otros pueblos ú otros individuos. No exigía del hombre que declaraba superior que fuese completo y armónico; le bastaba mutilado, por decirlo así, y hasta monstruoso: podía ser de limitado entendimiento y depravada moral, incapaz de comprender nada elevado ni hacer nada bueno; podía ser hasta excepcionalmente malo, y, no obstante, calificarse de superior, de grande, y lograr prestigio, poder, riqueza. En vez de concurrir á su elevación todas las dotes naturales verdaderamente humanas, y la voluntad para utilizarlas, bastábanle pocas cualidades ó alguna pasión que las suplía. Parece claro este hecho: que la guerra tiene un criterio _limitado é injusto_ para calificar á los hombres, elevándolos conforme á sus necesidades, que son las de la lucha, y no las de la justicia. Y si puede ensalzar y ensalza muchas veces á los menos inteligentes y más perversos, ¿qué reglas aplica á los que deprime? No serán equitativas, porque, en general, no se puede dar á un hombre más de lo que merece, sin que otro reciba menos de lo que es debido; y en este caso particular, el motivo que lleva á prescindir de todas las circunstancias malas que no perjudican para el combate, hace desdeñar las buenas que en él no se utilizan, y al batallador limitado ó perverso que se eleva corresponde el inteligente bondadoso que se rebaja, porque le repugna la lucha, la sangre, el estrago, porque ama la vida y respeta la de los otros. En vano habrá recibido altas dotes que puede y quiere utilizar en bien de sus semejantes; le faltan las que la guerra necesita, y es condenado ignominiosamente á formar parte de la masa que se desdeña y humilla.

Si el criterio de la guerra para establecer la desigualdad entre los hombres es limitado é injusto, los medios que pone á su disposición para elevarlos no son más equitativos. Muchas fuerzas ciegas que sigan el impulso de una que se reconoce superior, séalo ó no; muchas voluntades que guardan silencio para oir la voz de una sola voluntad que se impone; obediencias incondicionales é instantáneas, tan sordas al temor de la muerte como á las amonestaciones de la conciencia, y con la falta de responsabilidad, la depresión moral que rebaja. Autoridad sin límites, brillos deslumbradores, opresiones continuas necesarias ó calificadas de tales; el hábito de ver el hecho convertido en derecho, la fuerza en ley, la fortuna en mérito, todo hace que los

medios empleados por la guerra sean propios para elevar á los que debían quedar muy abajo, y rebajar á los que debieran ser ensalzados.

La guerra forma una escala en que están á inmensa distancia el soldado y el jefe, y abre un abismo entre el vencedor y el vencido. Nada más contrario á la igualdad que un ejército disciplinado, á no ser el pueblo que conquista. En un principio, el exterminio establece la igualdad ante la muerte; pero cuando se empieza á conceder la vida á los vencidos se convierten en esclavos con este ó el otro nombre, con más duras ó más tolerables condiciones; entonces se inician las grandes desigualdades, que van creciendo como la avalancha que desciende por la montaña nevada. Los opresores que se elevaron suben cada vez más; los oprimidos que descendieron quedan cada vez más abajo. Hay clases, hay castas: la organización social forma alrededor de los hombres como un círculo de hierro que nadie puede romper, y fatalmente encadenado, debe morir allí porque allí nació. Una vez establecidas estas desigualdades, el nacimiento da un brillo que nada obscurece, ó una infamia que ningún mérito borra: cuando esto sucede en un pueblo, aunque no se sepa su historia, bien puede asegurarse que se compone de conquistadores y conquistados, porque sólo la embriaguez sangrienta del triunfo puede dictar tales leyes, y sólo puede admitirlas el pánico de la derrota. Una vez establecidas, una vez abierto el abismo que separa los fuertes, los nobles, los explotadores de los débiles, viles y explotados, todo parece concurrir á aumentar el poderío de los unos y la humillación de los otros. Se ha dicho con verdad que los que nacen _en_ la esclavitud nacen _para_ la esclavitud, que se aumenta y perpetúa degradando á los esclavos. Sobre ellos pesa lo más rudo de la obra social; y como trabajan sin descanso, sufren sin quejas, viven sin goces y mueren sin rebeldías, parece natural que vivan, sufran y mueran así, de tal modo que no sólo los hombres de la fuerza bruta, sino los pensadores y los filósofos, tienen por natural, por equitativa, por razonable la más injusta de las desigualdades, la que las crea todas, la que separa á los hombres en esclavos y dueños, la que da á unos poder, riqueza, consideración, y á los otros miseria, impotencia é ignominia; la que envilece el trabajo y ennoblece el ocio.

A veces, la casta guerrera ó la nación conquistadora no son bastante fuertes para rebajar al mismo nivel todo lo que está por debajo de ella y gradúa la desigualdad como el feudalismo, y la servidumbre de los vencidos como Roma, creando diques escalonados donde vayan á estrellarse las oleadas que levanta el sentimiento de la justicia ó el dolor de la desesperación.

Así, pues, la guerra, por la clase de personas que encumbra, por la altura á que las eleva, por los medios que emplea para elevarlas, por lo mucho que rebaja á los que deprime y los motivos que para rebajarlos tiene porque hace de unos más, de otros menos que hombres, porque distribuye ventajas y perjuicios con exceso y sin criterio, y, en fin, porque da á todo esto la consistencia necesaria, no sólo para que se sostenga, sino para que se perpetúe: la guerra puede decirse que ha sido la causa más poderosa y general de desniveles sociales, y efecto de ella son hoy todavía muchas desigualdades cuyo origen no siempre se le atribuye.

Las religiones del mundo antiguo han contribuído también á que los hombres se eleven y se rebajen por motivos que no son ni diferencias naturales, ni méritos ó culpas, y antes bien proporcionando ventajas á veces en razón inversa de los merecimientos. Mientras la Divinidad es el Omnipotente incomprensible y temido que ninguno pretende conocer, que todos procuran hacerse propicio atrayendo su benevolencia ó aplacando su cólera, cada cual es el ministro de su propio culto, y la religión establece las diferencias del merecimiento, no las desigualdades de la jerarquía. Pero desde que lo incomprensible se convierte en misterio que algunos pretenden explicar, desde que hay dogma y sacerdote, hay superioridades espirituales que no tardan en convertirse en dictaduras, que en pueblos groseros se materializan. El sacerdocio forma casta privilegiada, hace alianza con la de los guerreros, y fortifica, sancionándola en nombre de Dios, la desigualdad más injusta entre los hombres. Parece que el panteísmo de la mayor parte de las religiones del mundo antiguo debía contribuir á la igualdad; pero el dogma, que abruma al hombre, que le anonada, que le quita fuerza y dignidad, que enerva todos los resortes de la persona hasta aniquilarla moralmente, es no un enemigo, sino un aliado de las profundas distinciones entre las clases: dada una masa que se predispone á la humillación, á quien se priva de energía para la resistencia, y que consiente en rebajarse, habrá siempre alguno, varios ó muchos que se eleven para oprimirla y explotarla.

Aun en los pueblos donde no hay casta sacerdotal, ni teocracia, forman los sacerdotes un cuerpo privilegiado, que, depositario de la verdad, no la comunican á todos igualmente. Los iniciados en los grandes misterios son pocos, y el Verbo divino no mora entre la muchedumbre, condenada á vivir en la miseria, en el envilecimiento y en el error. La desigualdad decretada en el campo de batalla se bendice y se consolida en el templo.

Así, pues, los progresos de la civilización son los de la desigualdad:

Porque dan lugar á que se cultiven facultades diferentes, se desplieguen actividades más ó menos enérgicas, y se manifiesten voluntades débiles ó fuertes, rectas ó torcidas;

Porque la guerra pierde el carácter de defensiva; no tiene ya por objeto vivir, sino engrandecerse, la conquista; sustituye al exterminio la esclavitud, y cuando los vencidos son esclavos, los vencedores dejan de ser compañeros;

Porque la religión hace del sacerdocio casta, ó al menos cuerpo privilegiado que da sus oráculos al pueblo supersticioso y grosero, arrojándole el error como se arroja á los perros la carne emponzoñada.

¿Y los progresos de la civilización llevarán consigo indefectible y eternamente los de la desigualdad? Lo primero es inevitable dada la naturaleza humana: la desigualdad crece en las primeras sociedades, que viven de guerra, de ignorancia y de superstición; pero tiene un límite, puede tenerle al menos, pasado el cual decrecerá é irá acercándose al mínimum posible. ¿Cómo se perpetúa? ¿Cómo disminuye? Procuremos investigarlo.

CAPÍTULO IV.

CÓMO SE PERPETÚA LA DESIGUALDAD INJUSTA.

La desigualdad en las masas, clases ó castas tiene los mismos elementos que en los individuos: el físico, el intelectual, el moral, y las diferencias que en un principio tal vez no existían, y las superioridades que eran acaso imaginarias, pueden llegar con el tiempo á ser reales y positivas. La violencia ó la astucia hizo la _clase_ ó la _casta_, que el tiempo puede convertir en _raza_; es decir, en un modo de ser físico, intelectual y moral diferente y superior en los privilegiados.

En lo físico, cuando por espacio de muchas generaciones unos se alimentan bien y trabajan poco, y otros viven en la miseria y abrumados de trabajo, si se mantienen perfectamente separados, al cabo de siglos, los descendientes de los primeros tendrán una superioridad física natural.

Además de lo que influye en el desarrollo de la inteligencia un físico endeble y enfermizo, ¿qué medios tiene de cultivarla el que no dispone de otro patrimonio que un trabajo material abrumador, ni puede ver en ella un medio de romper el círculo de hierro que le encadena en su clase? ¿Cómo y para qué ha de instruirse? No lo intenta. Embrutecido ha visto á su padre como le verán sus hijos; y cuando pasan una y otra y muchas generaciones de hombres que no han pensado, sus descendientes tienen menos actividad intelectual, menos inclinación y disposición para pensar. No se hereda el genio ni el talento, ni aun siquiera una regular inteligencia; porque todo esto, para que se haga perceptible por sus frutos, necesita el concurso de la voluntad: no se heredan individualmente aptitudes intelectuales; cualquiera sabe que hay tontos, hijos de personas de talento, y viceversa; pero numerosas colectividades, que desde largo tiempo cultivan ó no su inteligencia, y permanecen separadas, se irán diferenciando; la educación, de individual pasará á ser colectiva, producirá diferencias positivas y permanentes según las cuales la clase que se instruye, no sólo tiene la ventaja de instruirse, sino la de tener mayor aptitud natural para aprender.

En lo moral, la voluntad del hombre, su conciencia, su libre albedrío, limitan mucho la influencia de su posición social; en todas puede ser bueno, justo, santo, y lo es. Pero si su virtud no depende de su estado, y antes puede acrisolarse en el más humilde, es difícil que cuando nace muy abajo tenga condiciones de carácter que no favorezcan las desigualdades establecidas, y que sea digno, firme sin violencia, perseverante sin terquedad, contra los que intentan rebajarle, cuando ve que todos los suyos se humillan, se cansan, ceden.

Así, pues, establecida la desigualdad de las clases, y más aún de las castas, tiende á modificar á los hombres física, moral é intelectualmente, á convertir con el transcurso del tiempo en positivas, diferencias que eran imaginarias, y á perpetuarse dando ventajas naturales y permanentes que apoyan, fortifican, y en cierta medida legitiman las sociales. Y todo esto, no de individuo á individuo, sino de unas á otras colectividades.

Semejantes desigualdades, que de imaginarias llegan á ser positivas, parecen naturales, necesarias, justas, no sólo al vulgo, no sólo á la soberbia de los opresores y á la degradación de los oprimidos, sino á los que viven en la esfera elevada de las ideas y que no debían contaminarse con la injusticia del hecho, al establecer el derecho. Los grandes filósofos declaran conforme á él, la más inicua de las desigualdades, y proclaman la esclavitud como base indispensable del orden social. La ciencia, la religión, la fuerza proclaman la desigualdad como un axioma, como un dogma, como una institución veneranda, y la institución se venera y se consolida. La desigualdad extrema que priva á una clase de derechos, y casi no impone á otra deberes, las deprava á entrambas; y si alguna idea, si alguna creencia, si algún sentimiento no produce reacción moral fuerte en favor de una razonable igualdad, los

pueblos decaen, viven en el marasmo de la degradación y de la desdicha, ó son oprimidos y aun aniquilados fácilmente por otros, inferiores tal vez, bajo el punto de vista intelectual, pero superiores moralmente y donde no se han establecido esas diferencias extremas que convierten á unos hombres en semi-dioses y á otros en animales de carga.

CAPÍTULO V.

¿CUÁNDO, CÓMO Y CON QUÉ CONSECUENCIAS SE PERPETÚA LA DESIGUALDAD Ó SE RESTABLECE LA IGUALDAD?

Hemos visto que el resultado inevitable de la civilización, dada la naturaleza del hombre, es el progreso de la desigualdad, que se gradúa más y más á medida que aumentan los medios de diferenciarse. Valerosos heroicos y rebaños cobardes; ricos y pobres; ignorantes y sabios; todos los esplendores de la gloria, del genio, del lujo; todas las vilezas de la abyección, del embrutecimiento y de la miseria, crecen paralelas y separan cada vez más á los que elevan y á los que rebajan. Entonces llega una hora suprema en la vida de los pueblos, hora que decide de su prosperidad y á veces de su existencia, hora en que aceptan las divisiones de clases y de castas ó se rebelan contra el privilegio y piden derechos para todos, igualdad. Se comprende que ha de ser larga y terrible la lucha de los esclavos contra los señores, de los pobres contra los ricos, de los ignorantes contra los sabios; y se comprende también que si la igualdad es cosa fácil en una horda inculta, es muy difícil en un pueblo civilizado. Por más dificultosa que sea, es necesaria, en cierta medida, como la justicia, y se va reclamando y obteniendo en medio de combates, de exageraciones, de injusticias. Los que la piden y los que la niegan suelen desconocer sus condiciones, hasta dónde es preciso que llegue, de dónde no puede pasar, cómo es relativa al estado social del pueblo que la exige, y con frecuencia se ve en los privilegiados procedimientos para sostener la desigualdad que conduce al aniquilamiento y en los niveladores actos para establecer la igualdad salvaje.

En medio de esta lucha que inmola tantas víctimas y en que perecen tantos mártires, el trabajo se va lavando de la nota de infamia que le manchaba; la guerra se humaniza, no sólo en el sentido de no exterminar á los vencidos, sino en el de no oprimirlos, y tiende á igualarlos con los vencedores, ó los iguala absolutamente; el privilegio de las armas se convierte en una carga, en una profesión ó en un oficio; la religión llama á los hombres hermanos; la ciencia se difunde y se hace casi siempre aliada de los pequeños: es niveladora, no en el sentido de aplastar lo que sobresale, sino en el de elevar lo que está debajo; la miseria y la riqueza no se aproximan, pero se condicionan de diferente modo; no tienen el fatalismo inmóvil que las caracterizaba; puede ser rico y lo es muchas veces el hijo del pobre, y el del millonario muere en la miseria; ésta hará por mucho tiempo terribles estragos; pero nunca tantos como en los países en que hay la desigualdad de clases que no pueden confundirse, de castas eternamente separadas.

Las naciones, bajo el punto de vista que nos ocupa, forman dos grandes grupos: uno, de las que no reaccionan contra la desigualdad cuando ha llegado el caso en que es un elemento verdaderamente deletéreo, y se inmovilizan, decaen ó perecen; otro, de las que protestan, se rebelan, luchan contra los privilegios y los suprimen. Dependiendo la igualdad de causas tan varias, siendo tan influyente en todos los elementos sociales y tan influída por ellos, según circunstancias que varían al infinito, hallará mayores dificultades para establecerse, tendrá más combates, más vicisitudes, más derrotas, y avanzará rápida ó paulatinamente. Pero en todo caso, para el pueblo que llega á una civilización adelantada, el progreso, el verdadero progreso, que es á la vez material, intelectual y moral, no puede continuar sin el de la igualdad. Así la vemos crecer más despacio ó más de prisa, pero crecer siempre, en todos los pueblos verdaderamente prósperos y grandes.

¿Pero basta igualar á los hombres que forman una nación para que ésta sea digna y feliz? Seguramente que no. La igualdad forma parte de la justicia, no la constituye; y cuando el nivel está muy bajo, cuando significa la abyección de todos, menor será el daño si sobresalen algunos, y menos malas serán las aristocracias que el despotismo de uno solo sobre muchedumbres que, como rebaños, se esquilan y degüellan. Los defensores del privilegio presentan en su apoyo, no sólo aristocracias florecientes y democracias en decadencia, sino pueblos que fueron grandes mientras tuvieron profundas diferencias de castas ó clases, y para los cuales la igualdad fué la ruina.

Hay que distinguir, como hemos indicado, el nivel de la instrucción, del honor y de la virtud, del que establece el vicio, la ignominia y la ignorancia; hay que tomar la historia en largos períodos, sin lo cual no puede darnos lecciones. Llegados los pueblos á aquel grado de civilización en que la desigualdad inevitable subía al máximum, que degrada y arruina si no se reacciona contra ella, ¿quiénes son los que tienen interés y deseo de ponerle coto? Los que ha oprimido física, intelectual y moralmente: los pobres, los ignorantes, los viles; y como no es posible el instantáneo cambio que los iguale á los superiores, la transformación es lenta, y en algunos casos imposible. La desigualdad llega á ser como un miembro que es necesario cortar, pero al amputarle se ve que ha

sido inútil; el organismo todo estaba inficionado, la fiebre purulenta sobreviene, y la muerte es inevitable. De la misma manera decaen ó perecen los pueblos de los cuales desaparece una institución que los ha corrompido sin remedio. Lejos de abonarse una aristocracia por los extravíos de la democracia que la sigue, se condena, y la igualdad no hace más que reflejar y revelar los vicios del privilegio; sólo se puede defender éste cuando puede transformarse, cuando tiene en sí bastantes elementos morales é intelectuales para ser humano y expansivo, de manera que su sombra no mate, sino que, por el contrario, pueda crecer en ella la práctica del deber y la idea del derecho. La desigualdad exagerada, la casta, la clase inmóvil, paraliza y arruina al pueblo que en el momento necesario no reacciona, y será arrastrado á su ruina por una minoría privilegiada, ó por la mayoría niveladora que proclame el derecho cuando ya no es capaz de practicar el deber. La plebe envilecida y poderosa que sucede á una aristocracia, lejos de abonarla es su condenación, porque es su obra.

El privilegio en el mundo civilizado y cristiano no desaparece entre las ruinas del pueblo que dominó; antes, por el contrario, va transformándose en derecho y dando lugar, no á la igualdad que rebaja, sino á la que eleva. Los patricios no son arrastrados por el oleaje pestilente de un populacho vil, sino convertidos en ciudadanos é igualados á los que intelectual y moralmente no son inferiores á ellos ó los aventajan. Sin duda pasiones y errores producen tempestades; pero después que pasan, y aun en medio de ellas, el nivel moral é intelectual se eleva más cada día, y las diferencias disminuyen, no porque los de arriba descienden, sino porque los de abajo suben. En todas las naciones que progresan, progresa la igualdad, y puede afirmarse que, en la medida justa, es un elemento indispensable de bienestar y grandeza.

Y ¿cómo sabremos cuándo la supresión del privilegio precede á la ruina de un pueblo, y cuándo á su engrandecimiento? Fácil es investigarlo. Basta saber si se nivela rebajando á los de arriba, ó elevando á los de abajo: si lo primero, la igualdad es la muerte; si lo segundo, la vida.

Todos los pueblos han pasado, pasan ó pasarán por esa crisis de su civilización en que la desigualdad inevitable llega á un máximum incompatible con el progreso si no se reacciona contra ella. Y ¿por qué esta reacción se verifica en unos países y en otros no, es á veces saludable, á veces dañosa, y caminando todos al privilegio por vías muy parecidas, unos le conservan, otros le suprimen con buen éxito, y algunos se arruinan al arruinarle? No sabemos si habrá quien pueda dar respuesta satisfactoria á la pregunta: por nuestra parte, estamos muy lejos de tener ciencia bastante para conocer las causas de tan varios efectos, y nos limitaremos á señalar una que nos parece de suma importancia.

Comparando los pueblos que reaccionan á tiempo, y para bien suyo, contra la desigualdad, y los que para su mal la perpetúan ó la destruyen, se ve que los primeros no son siempre ni más ricos ni más inteligentes que los segundos, y que en muchos casos son más pobres y menos ilustrados, de modo que el elemento material é intelectual es inferior en ellos. Y siendo esto así, teniendo la desventaja de la mayor pobreza é ignorancia, ¿cómo realizan el progreso de suprimir á tiempo la desigualdad excesiva que corroe á otros? ¿Cuál fuerza los impulsa y los sostiene? La fuerza moral. Los pueblos en que el hombre es más digno, más justo, más humano, menos egoísta, menos débil para dejarse arrastrar por los vicios que degradan, mejor dispuesto para sentir los nobles y piadosos sentimientos que impulsan á la abnegación y al sacrificio; los pueblos más morales, en fin, son los que tienen pecheros que pueden transformarse en ciudadanos, aristocracias en que los señores son hombres con virtud y conciencia bastante para comprender los deberes de humanidad y practicarlos hasta dejar en ocasiones á sus pares, y formar en las filas de los plebeyos, y pelear á su lado y morir por ellos. En estos pueblos, los de abajo tienen corazón, la dignidad, aunque no sea más que latente, del hombre honrado; los de arriba tienen entrañas, y todos algo que repugna aceptar é imponer perpetuamente la servidumbre y la tiranía sin límites. Podrán ser más pobres y más ignorantes; pero son más dignos que los que oprimen sin misericordia y se dejan oprimir sin protesta, y la reacción contra desigualdades irritantes se verifica en virtud principalmente del elemento moral.

Esta verdad merece ser consignada, porque encierra, á nuestro parecer, una lección importante. Si pueblos ricos y cultos se han inmovilizado ó sucumbido en desigualdades incompatibles con el progreso, por falta de resorte moral; si por tenerle, otros inferiores en cultura, han suprimido privilegios que eran obstáculo insuperable á su bienestar, ¿no se pone en evidencia la gran parte que el elemento moral tiene para realizar la igualdad? De pueblo á pueblo el hecho es de más bulto, no más positivo que de clase á clase ó de individuo á individuo. En vano se mejorará la situación económica de las masas, y aun se les dará alguna instrucción; si están desmoralizadas no subirá su nivel, y antes es posible que descienda, y que á medida que se enriquecen (con riqueza relativa) se rebajen, porque usando en perjuicio de sus deberes los mayores recursos de que disponen, se alejan más cada vez de la igualdad en el derecho, y sólo para la común abyección quedan aptos.

No llevamos, procuramos, al menos, no llevar á ningún asunto espíritu de sistema ni exclusivismos, muy perjudiciales al descubrimiento de la verdad. No negamos, cuando se trata de las instituciones y modo de ser de un pueblo, la importancia que

tiene el elemento intelectual y físico ó económico; pero no suele darse la que tiene al moral; se conviene en que cierto grado de miseria y de ignorancia hace imposible la igualdad en el derecho; pero no se recuerda bastante que es también incompatible con la depravación y que exige un mínimum de virtud como de bienestar y de cultura. Por eso conviene recordar el testimonio de la historia; ver pueblos de una civilización adelantada abrumados por privilegios odiosos ó envilecidos bajo el nivel de la servidumbre por falta de resorte moral; y observando este hecho en el presente y en el pasado, en derredor nuestro y en remotos países, nos convenceremos de que no es fortuito, sino necesario, y que luchan contra las leyes de la naturaleza humana los que pretenden elevar socialmente al hombre que moralmente está rebajado.

No se puede hacer un ciudadano de un mendigo, de un loco, ni de un malvado; y en la casa de beneficencia, en el manicomio ó en el presidio pueden estudiarse bien, porque están en relieve los insuperables obstáculos que para igualar á los hombres sin rebajarlos opone la falta de lo necesario físico, intelectual y moral.

Sin este necesario no hay salud del cuerpo ni tampoco del alma, y los hombres que no están sanos de espíritu son tan inhábiles para la igualdad en el derecho como para el servicio militar cuando tienen defectos físicos.

Así, pues, al que olvida la importancia del elemento moral recordémosela, y la del físico é intelectual á los que hablan de igualdad en el derecho al que no la comprende, al que tiene hambre y á satisfacerla se limitan todas sus aspiraciones. Nunca se ha visto, y puede asegurarse que jamás se verá, que los hombres se igualen elevándose si su pobreza en todos conceptos llega á ser miseria. A veces, una idea, un sentimiento, suplen inferioridades y nivelan: la fe, el amor, la ciencia, la patria hallan mártires sublimes entre los hombres más obscuros, que la abnegación y el heroísmo sacan de su humilde esfera para elevarlos á la gloria y á la inmortalidad. Y no sólo individuos, sino que hay en la vida de los pueblos horas en que las muchedumbres, impulsadas por una idea ó un sentimiento, se igualan á los más altos; pero ya se prevee, y además puede observarse, que estas explosiones de entusiasmo no sirven para marcar la cultura permanente á que llegan las colectividades, ni establecen la regla de su marcha normal y progresiva: ayer dieron mártires y héroes, hoy ó mañana darán tiranos y esclavos; el nivel era como el de las aguas de una inundación, que desaparece con ellas y deja al descubierto todas las desigualdades del terreno. No hay igualdad permanente sino la que es armónica, ni armónica sino aquella que contiene, en grado mayor ó menor, pero siempre suficiente, los tres elementos esenciales del hombre, físico, intelectual y moral. Si no se estableciera esto por el raciocinio, lo pondría de manifiesto la historia de los progresos de la igualdad y de las inútiles tentativas para realizarla en el derecho.

Una vez iniciada con buen éxito la reacción contra desigualdades injustas, van disminuyendo ó desaparecen muchas que, en fuerza de ser antiguas y positivas, parecían naturales y necesarias. Derribado el obstáculo que se opone á que los hombres cultiven sus aptitudes varias, y se multipliquen, no dentro de una clase ó casta, sino según sus condiciones económicas, afectivas é intelectuales, sucederán dos cosas de capital importancia.

Las ventajas físicas é intelectuales, la superioridad moral, no serán dones de la naturaleza ó merecimientos de la virtud, que esteriliza constante y fatalmente la organización social, sino que podrán, con mayor ó menor esfuerzo, pero podrán al fin elevar á los humildes y rebajar á los soberbios que no tienen aptitud adecuada ni voluntad recta para sostenerse á la altura en que los colocó la suerte. La ciencia, el poder y la riqueza no estarán vedados á nadie ni serán patrimonio de ninguno, y lejos de abrumar sin remedio á los de abajo, podrán servir de estímulo á sus aspiraciones levantadas. Las dotes naturales y la voluntad recta y firme, la voluntad débil y torcida ó la escasa inteligencia, cuando no hay una institución que tuerza ó paralice sus determinaciones libres, producen continuos cambios de posición, en que los pobres de ayer son los ricos de hoy, y en que el que nació en la clase más humilde muere potentado. Las armas y las letras, la ciencia y el poder, la religión y el arte, el comercio y la industria, tendrán eminencias que han venido de muy abajo, y se establecerá un movimiento de ascenso y descenso que tiende á confundir lo que antes parecía irremisiblemente separado.

Cuando las clases pueden confundirse y más ó menos se confunden, no tienden á formar _razas_, es decir, á acumular por espacio de muchas generaciones ventajas é inconvenientes, disposiciones que se trasmiten, diferencias que de sociales han pasado á ser fisiológicas, ventajas é inferioridades que explican en los unos la humillación y en los otros la soberbia. No se inmovilizan las masas en el aislamiento de las clases, y las inferiores progresarán de dos modos: ilustrándose y participando de la herencia de otras más ilustradas.

Así, pues, como las desigualdades injustas producen efectos que tienden á perpetuarlas cuando se reacciona contra ellas, la igualdad en el derecho, una vez iniciada, prepara sus propios progresos, lleva en sí las condiciones de su incremento y, como la fama, adquiere fuerza marchando.

CAPÍTULO VI.

¿EN QUÉ ESFERA SE ESTABLECE PRIMERAMENTE LA IGUALDAD?

En cualquier pueblo que nos propongamos estudiar podremos ver:

Palacios monumentales, casas lujosas, habitaciones cómodas, albergues en que no hay comodidad, tugurios, chozas, cuevas que parecen inhabitables y que lo son bajo el punto de vista higiénico;

Costosos trajes de ricas telas, encajes primorosos, piedras preciosas, oro y perlas, vestidos modestos, ropas ordinarias ó burdas, harapos y desnudez;

Refinamientos en el atavío y cuidado de la persona, pomadas, jabones, aguas olorosas, cosméticos, tintes, pinturas, todo género de afeite cuyo objeto es hermosearla, esmero razonable, limpieza higiénica, descuido perjudicial, abandono completo y suciedad repugnante;

Mesa opípara artísticamente preparada, manjares variados y exquisitos que en costosa profusión ofrecen servidores de frac, alimentos sustanciosos y abundantes, comida necesaria, escasa, insuficiente, hambre;

Paredes cubiertas de seda, suelos de alfombra, techos artesonados, cortinajes, adornos, raso, terciopelo, oro, maderas primorosamente esculpidas, ajuar elegante, cómodo, decente, pobre, miserable, en que no hay silla donde sentarse ni cama en que dormir;

Variedad de carruajes y de soberbios caballos, coche modesto y propio, vehículo alquilado, botas impermeables, zapatos que dejan pasar la humedad, pies descalzos;

Torrentes de luz que reflejan espejos venecianos y jarrones de Sèvres, alumbrado suficiente, escaso, obscuridad completa por falta de medios de alumbrarse;

Fuego sostenido por el combustible más caro que se ve á través de la tallada pantalla de cristal, atmósfera tibia en Diciembre y perfumada por plantas olorosas, temperatura conveniente, muy baja, insoportable, en que el frío duele y mata;

Costosas diversiones que se suceden, recreo razonable, trabajo abrumador, ocio aburrido;

Multitud de impresiones recibidas en ciudades y países diversos, variedad de objetos que se ven ó se conocen, monotonía de una existencia en cuyo limitado horizonte se descubren pocas cosas y siempre las mismas;

Prestigio, gloria, aplauso, buen nombre, obscuridad, desprecio, humillación, ignominia;

Poder, mando, subordinación, obediencia incondicional;

Ciencia profunda, extenso saber, instrucción, ignorancia.

Todos estos contrastes, que parecen rebuscados con empeño, se ofrecen como espontáneamente á la observación, y aun diríamos á la simple vista de cualquiera que la fije en los fenómenos sociales. En todos los países, más ó menos, siempre comprendiendo numerosas colectividades, existen estas profundas diferencias. Y á pesar de ellas, y aunque se acumulen, lo cual es muy frecuente, ¿puede establecerse igualdad? ¿Cómo, en qué, para qué se establecerá entre personas tan distintas? ¿Puede ser para ellos más que una palabra con que se disfraza una ilusión ó un engaño? ¿En qué pueden ser iguales aquel pobre y aquel rico, aquel poderoso y aquel débil, aquel sabio y aquel ignorante? ¿Qué poder nivelador rebajará á los unos ó elevará á los otros? ¿Existe, puede existir ese poder? Sí, ese poder existe; es la voluntad del hombre, su libre albedrío, su fuerza moral.

Por ella es bueno ó malo, digno ó infame, santo ó malhechor; se iguala á los primeros ó desciende hasta los últimos, y en medio de tantas diferencias hace posible y cierta _la igualdad ante la ley_.

¿Ante qué ley? puede preguntarse, porque hay muchas leyes. Cierto; la ley política puede negarle ó concederle voto, según sea pobre ó rico, instruído ó ignorante; la ley de Beneficencia puede darle ó negarle permiso para pedir limosna, según sea un individuo aislado, ó pertenezca á una colectividad legalmente constituída; la ley de instrucción pública puede prohibirle que enseñe, ó autorizarle para enseñar, según que tenga ó no las circunstancias requeridas; pero en medio de estas y otras desigualdades, en todo pueblo que pretende llamarse culto existe _la igualdad ante la ley civil y ante la ley penal_. Las mismas

condiciones se exigen para los contratos de los pobres y de los ricos, y es igualmente justiciable un delincuente, cualquiera que sea su posición social, su ignorancia ó su ciencia. No siempre sucedió así, ni hace mucho tiempo que sucede; pero hoy nos causaría tanta indignación como asombro que la tramitación legal difiriese según la importancia de los procesados ó contratantes; que las penas se aplicasen, no según los delitos, sino según las personas que los cometían, y que dependiese de la calidad del muerto que el matador pagase con la vida ó con algunas monedas. Nada de esto puede suceder ya, y parece tan natural que no suceda, que las personas que lo ignoran no suponen que nunca haya sucedido. En la historia se encuentran estas distinciones; en el recto juicio y en la conciencia, no.

Como la igualdad ante la ley penal ni es una imposición pasajera de un déspota omnipotente ni de la plebe amotinada; como se la ve razonada, crecer, afirmarse á medida que las naciones se ilustran y se constituyen conforme á derecho, puede considerarse como un hecho que permanecerá. Pero todo hecho permanente tiene una causa que lo es también. ¿Y cuál puede ser esta causa en el asunto que nos ocupa? Esta causa no puede ser más que un elemento _común_, alguna gran semejanza entre esos mismos hombres en que se perciben diferencias tan notables bajo otros respectos, pero que en alguno pueden ser y se consideran como iguales. Esa causa, ese elemento común es el moral; y como todos (los sanos de espíritu) distinguen el mal del bien, pueden realizar el uno ó el otro y son responsables ó beneméritos igualmente con diferencias personales, pero no de clase, se prescinde de ésta para juzgarlos moralmente y se los iguala.

Por más que digan los que pretenden separar la moral del derecho como cosas independientes, no sólo el derecho no puede separarse de la moral, sino que el progreso consiste en que se unan cada vez más íntimamente, y el ideal en que no hubiese ninguna inmoralidad que no pudiera ser y no fuese penada por la ley. No podemos extendernos sobre este asunto sin pasar los límites del que nos ocupa; pero hemos debido hacer esta indicación para salir al encuentro á una réplica posible contra lo dicho, de que la igualdad moral es el origen, base y afianzamiento de la igualdad ante la ley penal.

El pobre y el ignorante, como el millonario y el docto, ama á sus hijos y es amado de sus padres; es buen amigo, fiel confidente; tiene sentimientos y afectos y determinaciones dignas; respeta la propiedad ajena, la vida de los otros hombres, por cuyo bien inmola á veces la suya. El filósofo moralista encuentra allí una moralidad responsable, tan _responsable_ como la de un gran señor ó un sabio, y una personalidad _respetable_ en la misma medida; y el legislador, partiendo de este hecho, declara á los hombres iguales ante la ley penal. Pueden no ser todos electores, ni elegibles, ni catedráticos, ni ingenieros; pero todos pueden ser honrados, deben serlo y faltan cuando no lo son: según los grados de la falta, no según el que ocupa el que la comete, se impone la pena, que es, que debe ser al menos, consecuencia de una inmoralidad que la ley ha calificado justiciable.

¿Es _idéntico_ el conocimiento que tiene del mal que hace un hombre rudo y un hombre ilustrado? Puede que lo sea y puede que no. Puede que lo sea, porque el que sabe sumar, por ejemplo, aunque no sepa álgebra, ni cálculo diferencial, suma tan bien como el más consumado matemático, y el mal hecho podrá ser tan claro y sencillo para la conciencia, como para el entendimiento el que dos y dos son cuatro. El pensador sabrá la filosofía de las matemáticas y la del derecho que el letrado ignora; mas para sumar y conducirse bien basta la razón práctica, y no son menester especulaciones metafísicas ni conceptos trascendentales.

Como la identidad no existe entre las personas, ni aun en las cosas que podemos observar, la igualdad hemos dicho que es aquel grado de semejanza necesario al objeto que nos proponemos al hacer la comparación. Al comparar moralmente á un rico y á un pobre, á un sabio y á un ignorante, á través de sus muchas diferencias encontramos entre ellos la semejanza _necesaria_ y _suficiente_ para declararlos _iguales_ ante la ley civil y ante la ley penal, é iguales los declaramos; y esta declaración no es ilusoria como otras que carecen de fundamento, sino que es real, positiva, practicable y practicada, como que tiene por base un hecho cierto universalmente reconocido.

Así, la moral, que hemos visto tan poderosa para establecer igualdad entre las personas que en virtud de su voluntad recta ó torcida se rebajan ó se elevan, utilizando ó haciendo inútiles ó perjudiciales los altos dones que han recibido; la moral, que en los pueblos influye poderosamente para que reaccionen contra la desigualdad injusta, cuando es ya incompatible con el progreso y produce la decadencia; la moral, que para el bien de las naciones como de los individuos puede suplir tantas cosas y no puede ser suplida por ninguna; la moral conserva siempre su carácter nivelador, en el buen sentido de la palabra, el carácter de igualar elevando y en su esfera más propia, en aquella en que su influencia es mayor, es donde primero se establece la igualdad, porque es donde realmente existe primero.

El que los derechos civiles preceden á los políticos y la igualdad ante la ley penal se establece en medio de las mayores desigualdades, es un hecho de todos conocido; pero conviene recordarle y tener en cuenta las causas que le producen, á saber:

Que en la esfera moral es donde primero se establece la igualdad;

Que para establecer la igualdad basta la semejanza _necesaria_.

Las diferencias se perciben á primera vista; pero reflexionando se ve que el orden moral, religioso y jurídico tiene por condición la semejanza. Los preceptos, las reglas, las leyes, no pueden obligar á todos por igual, sino porque en todos hallan igualmente aptitudes bastantes para comprenderlas y cumplimentarlas.

CAPÍTULO VII.

LÍMITES DE LA IGUALDAD.

Los límites de la igualdad pueden variar mucho de hecho y de derecho, según los establezca la fuerza y el error, ó la razón y la justicia; pero aunque varíen han de existir, porque en lo humano todo los tiene, y porque un elemento de la organización social, sea el que fuere, no puede prescindir de los otros, no siendo único, ni dejar de ser condicional si ha de ser armónico. Las condiciones variarán con los tiempos y lugares; _à priori_ no pueden señalarse detalladamente; pero sí afirmar que existirán, y que, no habiendo derecho contra el derecho, los de la igualdad no pueden destruir ni invalidar otros.

Pocos hay que no sepan esto; pero muchos son los que lo olvidan y quieren llevar la igualdad donde no puede ir y darle una extensión que no está en la naturaleza de las cosas.

La igualdad estará limitada más ó menos; pero estará siempre limitada:

Por las diferencias naturales;

Por las que produce la voluntad del hombre;

Por lo que se llama la fortuna;

Por la ley, que tiende á aumentar la desigualdad cuando existe;

Por las necesidades sociales;

Por el Derecho.

LAS DIFERENCIAS NATURALES pueden ser tan grandes que produzcan desigualdad inevitable; hay dotes de alto precio que ninguna voluntad iguala, y desventajas que el más firme propósito no compensa. El gran talento para la guerra, las ciencias, las artes, la política, el comercio, la industria, descollará dadas ciertas circunstancias, sin que sea posible que la medianía se ponga á su nivel por más que emplee un trabajo intenso y perseverante; por el contrario, hay ineptitudes que se esforzarían en vano para subir ni aun adonde están los medianos. Tales casos, por ser raros, no dejan de existir y de ejercer una influencia mayor ó menor, según muchas circunstancias, pero siempre positiva é inevitable. Esto se entiende en la esfera física é intelectual, que en la moral ya sabemos que la altura depende de la voluntad de elevarse. Los hombres, á medida que vivan en condiciones más parecidas, creemos que se parecerán más y que habrá menos desigualdades naturales; pero, más ó menos, existirán siempre, y en cierta medida son necesarias para que los hombres vivan en una sociedad culta y progresiva.

LAS DIFERENCIAS QUE PRODUCE LA VOLUNTAD DEL HOMBRE son causa más poderosa de desigualdad que las naturales. Las grandes ventajas ó desventajas congénitas son raras, y muy común suplir éstas con una resolución firme y perseverante ó esterilizar aquéllas con la flojedad ó perversión del ánimo. Ya hemos recordado más arriba el hecho bien conocido y muy general de los que la determinación firme, débil ó torcida, ó eleva, ó rebaja, y si aquí lo repetimos es para hacer notar que, en mayor ó menor grado, tiene que ser inevitable y permanente, porque depende de la voluntad libre del hombre, á quien no se puede trazar una órbita para que sin salir de ella gire como los astros. El nivel moral podrá elevarse y se elevará; habrá más voluntades firmes y rectas, pero no se concibe que deje de haber desviaciones, y quien esté por encima y por debajo del nivel común, y grados en la virtud y en el vicio, en la santidad y en el crimen. El poder del libre albedrío del hombre, sobre permanente, como que forma parte de su naturaleza, se extiende á lo físico, á lo intelectual, á lo moral, á todo su sér. Las ventajas de la belleza, de la robustez, del talento, ó los inconvenientes contrarios, no ejercen una influencia decisiva fuera de su círculo de acción propia: por más capacidad que tenga un hombre no logrará convertirse de feo en hermoso, ni viceversa, y por más robusto que sea, no trocará en facultades intelectuales su fuerza muscular, ni con ella las destruirá tampoco. El poder de suplir en gran parte muchas ventajas ó hacerlas

completamente inútiles, y aun perjudiciales, no existe más que en la voluntad del hombre: ella es, puede ser, un elemento nivelador; pero en cierta medida será siempre una causa de desigualdad, porque no se concibe que los hombres no _usen desigualmente_ de medios de que disponen, aunque éstos fuesen iguales.

LO QUE SE LLAMA FORTUNA influye en la posición de los hombres, en su bienestar ó su desdicha. La fortuna, en el sentido de acaso, no existe; hay Providencia, ó, para los que no creen en ella, encadenamiento de causas y efectos, _causalidad_, no _casualidad_; pero, de todos modos, hay efectos de cuyas causas no dispone el hombre, y que influyen para que se eleve ó quede muy abajo. Sin duda que se atribuyen á la suerte muchos bienes, obra del mérito; muchos males, consecuencia de faltas; pero también es cierto que hay prosperidades y desdichas por razones que no se alcanzan, por justicia que no se comprende. Lejos, muy lejos de nosotros negar esa justicia y esa razón porque está por encima de la nuestra: la acatamos profunda y sinceramente; pero no por eso hemos de dejar de ver en lo que se llama fortuna un elemento de desigualdad, tal vez justa, pero indudablemente positiva.

LA LEY QUE TIENDE Á AUMENTAR LA DESIGUALDAD CUANDO EXISTE, la llamamos así porque nos parece tener el carácter de ley, es decir, de regla general y necesaria. Si establecemos un nivel, sea en lo físico, en lo intelectual ó en lo moral, veremos la tendencia á elevarse más los que están sobre él y á rebajarse los que quedan por debajo.

En lo físico, el que es fuerte y robusto puede allegar medios de subsistencia con que acrecentar esa robustez; el que es débil, está expuesto á la miseria, que aumentará su debilidad; el que dispone de un capital, halla facilidades para acrecentarle, mayores cuanto es mayor: la riqueza atrae la riqueza y la multiplica; el que es pobre, al menor contratiempo se empobrece más, cae en la miseria: hay una fuerza que empuja, al uno á la opulencia, al otro á la ruina.

En el que empieza á instruirse, la adquirida instrucción le da medios y facilidades para aumentarla; le inspira el deseo también por el amor á la ciencia ó el convencimiento de su utilidad; el que es ignorante y continúa siéndolo, aun en el caso de que pueda procurarse instrucción, no la procura, porque, no teniendo idea de las ventajas y de los goces del saber, no los busca; cuanto más tiempo pasa, más difícil le será el trabajo intelectual y tendrá menos deseo de vencer esta dificultad; su inteligencia se atrofiará como un órgano que no se usa, y por gravitación intelectual, el uno irá subiendo hasta ilustrarse, el otro descendiendo hasta embrutecerse.

El hombre virtuoso halla goces y facilidades para la virtud, que le elevan en ella cada vez más. Vencidos, tiene sus impulsos egoístas, sus apetitos groseros, sus ímpetus iracundos: luchó, triunfó, y ha llegado á aquella altura en que no comprende cómo pueda hacer mal á sabiendas en cosa grave, y en que su naturaleza, ennoblecida por su firme voluntad, tiene por ley hacer bien; este bien tiende á acrecentarse como los tesoros del rico. El hombre vicioso se debilita á medida que cede; cada falta es una derrota que le predispone á ser derrotado; á los efectos deprimentes del mal se añade el hábito de cometerle, y la pendiente hacia él es tan rápida, que sin una reacción fuerte, así como el que se elevó en la virtud puede llegar á ser santo, el que descendió se halla en peligro de ser criminal, y vemos esas criaturas que parecen impecables é incorregibles.

Pueden limitarse los casos (y creemos que se limitarán más cada vez) de miseria física, moral é intelectual; pero si cualquiera de ellos llega, por el hecho de existir propende á crecer, y nos parece que las grandes desigualdades, de cualquier género que sean, tienden á aumentarse, como la distancia entre dos líneas no paralelas que se prolongan.

LAS NECESIDADES SOCIALES imponen cierto grado de desigualdad por la división de trabajo y por las diferencias que en el obrero lleva consigo la diferente clase de obra. Sin duda que se va reconociendo, y más cada vez, como un factor común al apreciar el valor de las personas y sus desemejanzas; este factor común es el elemento humano, la cualidad de hombre que todos tienen; pero aunque ésta nivele á los más humildes con los más elevados bajo ciertos conceptos, siempre sucederá que de las múltiples necesidades de una civilización adelantada hayan de resultar trabajos diversos que exigen aptitudes diferentes y combinaciones en el arte, en la ciencia, en la industria, en el comercio, muy propias para establecer desigualdades. Estas combinaciones podrán neutralizarse con otras, no destruirse, porque son indispensables en las necesidades crecientes de la creciente civilización.

EL DERECHO será límite á la igualdad siempre que contra él quiera girar fuera de su órbita. Un elemento social por mucho tiempo comprimido suele aparecer haciendo explosión; y como si quisiera vengarse de haber sido negado negando, pretende, no sólo su natural y debida influencia, sino la que corresponde á otros, y porque fué desconocido quiere ser preponderante. Algo de esto acontece con la igualdad, que, á consecuencia de depresiones injustas, pide nivelaciones imposibles. Contra sus extravíos no habría remedio más eficaz que el conocimiento del Derecho, si se generalizara; él encauzaría esa corriente que tiende á

desbordarse, y en ocasiones se desborda. Cuando hay un derecho que lo es verdaderamente, no puede invalidarse por ninguna pretensión, injusta desde que pretende destruirle, y definiendo bien y marcando los límites de todos, se sabe de dónde no puede pasar cada uno. Esto es á la verdad bien sencillo y bien sabido, mas no por todos, y precisamente lo ignoran aquellos á quienes más convendría saberlo para no hacer de la igualdad alguna cosa absoluta, incondicionada y absorbente de todos los elementos sociales.

En virtud de la igualdad ante el Derecho, existe á veces la desigualdad entre los hombres; porque no teniendo todos iguales títulos, sería injusta su pretensión de igualarse. El malhechor que está preso y el hombre honrado que goza de libertad; el ignorante á quien se prohibe una profesión y el instruído á quien se autoriza para ejercerla; el pródigo á quien hay que quitar la administración de sus bienes, y el encargado por la ley para administrarlos, personas son que aparecen desiguales precisamente en virtud de la igualdad del Derecho, que, dando á cada uno lo que le es debido, no puede dar lo mismo á los que merecen de un modo tan diferente. A unos se debe una prisión, un tutor ejemplar, una camisa de fuerza; á otros el público aprecio, una corona, una estatua; y el que pretendiera identificar aquéllos y éstos, hollaría el Derecho en vez de establecerle.

Cierto que importa mucho antes consignar los derechos cerciorarse bien de que lo son; mas porque pueda haberlos mal definidos y aun en desacuerdo con la justicia, no se ha de atacar en su principio la santidad del Derecho ni prescindir de él alegando otro, sea el que fuere. Y como es raro, muy raro, que un derecho carezca enteramente de justicia, que en su motivo de ser no tenga alguna razón de ser, es necesario analizarle bien antes de declararle incompatible con otro que le destruya. Y de todos modos, y aunque la injusticia sea evidente, ni autoriza otra, ni con otra se neutraliza, sino que, por el contrario, se suma con ella. La igualdad fuera del derecho no estará fuera de él por atacar á alguno que á su vez no le haya respetado. Si yo, por ser igual al que tiene reloj, se lo quito á un ladrón que le ha robado, aunque mi derecho á la igualdad no esté limitado por el de propiedad, que él no tiene, lo estará por el de algún otro, puesto que es claro mi deber de no apropiarme lo que en ningún concepto puedo considerar como mío.

Así, pues, variarán los límites, pero siempre los hallará el derecho á la igualdad en otros derechos.

PARTE SEGUNDA.

De la igualdad, socialmente considerada.

CAPÍTULO PRIMERO.

INFLUENCIA RECÍPROCA DE LOS ELEMENTOS FÍSICO, INTELECTUAL Y MORAL, Y DE LA SEMEJANZA NECESARIA Y SUFICIENTE PARA ESTABLECER LA IGUALDAD.

Cuando se observa en las sociedades los progresos de la igualdad y las dificultades que para progresar halla, es fácil notar que éstas provienen en gran parte del desequilibrio de elementos que deberían armonizarse.

El hombre, sér físico, intelectual y moral, no puede consolidar ninguna institución social, y menos perpetuarla, si prescinde de sus condiciones morales, intelectuales ó físicas.

La igualdad necesita _semejanzas suficientes_ entre aquellos que ha de igualar, y sin las cuales pretenderá realizarse en vano.

Estas semejanzas no han de ser parciales, sino abarcar totalmente la existencia del hombre. Uno ú otro individuo podrá, con voluntad y virtudes excepcionales, sobreponerse á circunstancias abrumadoras; pero la regla es que, cualesquiera que sean los principios que se proclamen y las leyes que se promulguen en la vida de la sociedad, no hay igualdad _positiva_ sin semejanza _suficiente_.

Cuando falta albergue, sustento y vestido, en la miseria extrema, ¿puede igualarse el hombre que la padece al que tiene recursos superabundante? ¿Puede prescindir del frío y del hambre para cultivar las facultades de su espíritu? ¿Puede triunfar de la fuerza tiránica de las necesidades no satisfechas, hasta el punto de avasallarlas para que no le embrutezcan? ¿Puede sobreponerse por su carácter á su desventura, elevarse en una situación que humilla y hacer respetar una dignidad cubierta de harapos? Si en lo posible y por excepción cabe que suceda todo esto, la regla será siempre la que vemos en la práctica: que la miseria física lleva consigo la intelectual, y la moral en parte.

Y al que es moralmente miserable, ¿de qué le sirven los recursos materiales suficientes y aun superabundantes? ¿No vemos al vicioso y al criminal inutilizar ó volver contra sí y contra la sociedad los bienes y las dotes que había recibido de la fortuna ó de la naturaleza? Igual ó superior á los que estaban al nivel común, ¿no ha descendido hasta los más bajos? ¿No le vemos rehusar el trabajo material y el del espíritu, ó incapaz de trabajar á fuerza de excesos ó por el hábito de la holganza? ¿De qué le servirá la igualdad ante la ley que le allanó los caminos de la fortuna, si él se labra su desgracia y es propio é insuperable obstáculo á su bienestar?

La miseria intelectual prepara también las otras: cierto que la honradez es compatible con muchos grados de ignorancia. Siendo el lazo moral el más fuerte y necesario para que los hombres puedan vivir asociados, y la moralidad la condición más precisa para su moralización, Dios ha provisto á esta imperiosa necesidad dándoles la intuición del mal y del bien y el libre albedrío para realizarle. Basta poca inteligencia para ser bueno y aun para ser justo; pero alguna se necesita, y más cuando se vive en un pueblo ilustrado. La vida social en parte es armonía, en parte lucha, y fácil es notar que nuestra existencia es utilizar armonías y triunfar de dificultades. Para lo que es armónico puede bastar lo espontáneo, lo intuitivo, lo que todo hombre cabal sabe sin aprenderlo; mas para la lucha se necesitan armas iguales, y no las tiene el que carece absolutamente de cultura en un país muy civilizado. La desventaja se gradúa; pero puede ser extrema y tal, que esta desigualdad lleve á otras, sin que haya más medio de evitarlas que evitándola.

El hombre embrutecido en un pueblo culto, recibe escasa remuneración por su trabajo; éste es más rudo, con frecuencia malsano, ó porque lo sea en sí, ó porque no se tomen las precauciones debidas para sanearle. El operario, ó lo ignora, ó se conduce como si lo ignorase, ya por descuido, ya por una especie de fatalismo, muy propio de la ignorancia, ya, en fin, porque otros están prontos á aceptar las condiciones que él no acepte, y la necesidad de vivir le impone la de recibir la ley económica, por dura que sea. Resulta que la inferioridad intelectual origina la física por el mucho trabajo, á veces malsano y poco retribuído, y en consecuencia, alimento escaso ó mala vivienda. Así se ha degradado físicamente la población de muchas comarcas, antes notables por su robustez y belleza, hoy débiles y con gran número de individuos deformes. No puede entrar en nuestro plan hacernos cargo de las causas todas que han producido tan deplorable efecto, que sólo hemos citado en apoyo de nuestra aserción de que una desigualdad grande en un elemento de los que constituyen el hombre influye sobre los otros y puede desnivelarlos.

Para que la igualdad que se defiende en los libros, se proclama en las Constituciones y se promulga en los códigos pueda ser un hecho social, es necesario que no halle desniveles tan grandes y tan generalizados que imposibiliten el equilibrio estable, el cual exige un _mínimum_ de semejanza en el modo de ser de los asociados. Esta semejanza, hay que repetirlo, no basta que sea parcial; no ha de limitarse á uno de los elementos de la humanidad, sino comprenderlos todos, porque donde quiera que haya grandes masas de hombres en la miseria extrema, en la depravación suma ó en la ignorancia absoluta, se pretenderá en vano igualarlos con los que estén en circunstancias opuestas. Hemos dicho _ó_ porque, según se ha visto, una inferioridad produce otras; es fuerza que arrastra ó virus que inficiona, y empresa ilusoria hacer independiente en el organismo social lo que en la naturaleza tiene dependencia mutua.

Así, pues, para que la igualdad se establezca en el derecho y la justicia es necesario que los hombres no se hallen en circunstancias que la hagan imposible por esenciales diferencias en lo físico, lo moral ó lo intelectual, y que paralelamente marchen los progresos económicos, los intelectuales y los morales.

Se preguntará, tal vez, si para establecer la igualdad en el derecho han de ser todos ricos, sabios ó justos. Responderemos recordando que la _igualdad_ no es la _identidad_, sino aquel grado de _semejanza suficiente_ al fin á que han de concurrir los términos de la comparación. Los términos de la comparación aquí son hombres, y lo que hay que investigar es la semejanza que basta para que en la sociedad se consideren como iguales.

Ya sabemos que los grados de semejanza necesarios para calificar dos cosas de iguales varían según la clase de ellas y objeto á que se las destina: con las personas acontece lo propio. Aplicando este principio á la práctica social, tal vez pueda auxiliamos para evitar errores ó, por lo menos, la confusión que les es muy propicia.

Un hombre cae herido en la calle; el agresor huye: cualquiera que pasa tiene aptitud moral y legal para restañar la sangre que corre de las heridas del primero y detener al segundo; es un acto humano y social, para el que son iguales el rico y el pobre, el sabio y el ignorante, el mayor y el menor de edad, el que está privado de derechos civiles como el que goza de ellos, y á nadie se acusará de haberse extralimitado al apoderarse del criminal y auxiliar á su víctima. Sométese el hecho á la acción de los tribunales, y la igualdad se limita: jurado y juez no puede ser el primero que pasa por la calle; se necesitan condiciones que la ley

marca, y sólo los que las tienen son iguales para aquel objeto: lo propio acontece para dar dictamen facultativo y para servir de testigo. El círculo de la igualdad se limita en las funciones sociales á medida que éstas exigen condiciones que unos tienen y de que otros carecen.

Para asistir con fruto á una escuela de instrucción primaria no se necesita conocimientos previos; hay que saber las primeras letras para la segunda enseñanza, y tener ésta para adquirir la superior: la igualdad, que tenía una extensión casi ilimitada en la escuela, va reduciéndose más, á medida que se refiere á cosas más diferentes.

Un testador considera iguales, para testigos de su testamento, á todos los hombres, con pocas excepciones; pero ¡cuán diferentes le parecen para albaceas, y más aún si busca entre ellos al tutor de las tiernas criaturas que su muerte deja en la orfandad!

Podrían multiplicarse los ejemplos en prueba de que la igualdad en la práctica, conforme dejamos indicado en la teoría, es una cosa relativa y varia que exige diversos grados de semejanza.

Hay, pues, igualdad social, ó puede y debe haberla, cuando existe la de aptitudes, para el caso en que se establece la comparación; si no, no.

Existe el riesgo de chocar en dos opuestos escollos, que son: prescindir de la _semejanza necesaria_, y no hacerse cargo de la _semejanza suficiente_. Pretender que los hombres sin las condiciones morales é intelectuales indispensables para igualarlos sean iguales, ó negar que pueden serlo cuando tienen las que bastan, aunque no las tengan todas.

El orden físico, la igualdad _suficiente_ para sostener la salud y vigor del cuerpo, no exige que todos tengan la misma clase de vestido, de habitación y de alimento, sino que ninguno carezca de ropas, de albergue y de comida. Lo _necesario fisiológico_ es lo que basta para establecer la igualdad física, y nada importa que los manjares sean menos regalados, el traje más basto y la casa más reducida y modesta. El que no tiene hambre, ni frío, ni vive en una habitación malsana, es _suficientemente igual_ al que disfruta de todos los refinamientos del lujo. La vanidad, la gula y la molicie podrán pedir mayores semejanzas; pero á la fisiología y á la higiene le bastan éstas, y no sólo habrá igualdad, sino superioridad física en los que tienen lo necesario respecto de los que disfrutan de lo superfluo, porque la sobriedad no suele ser compañera del mucho regalo. Que cada uno procure por medios honrados mejorar su posición material, y tener mayor desahogo y comodidades, no es vituperable, y aun laudable puede ser; pero que en el orden fisiológico se dé el nombre de necesidad á los caprichos, á las vanidades y á los apetitos indómitos; que se ponga por condición del orden social lo que no lo es del orden natural, y se considere como una desgracia ó como una injusticia la falta de igualdad completa en el alimento, el vestido y la habitación, errores son de gran bulto y fatales consecuencias. Aquel á quien no falta nada para robustecerse y vivir con salud, es esencialmente igual en lo físico á los mayores potentados, y probablemente superior á ellos, y la semejanza suficiente para establecer la igualdad en este punto la tienen todos los que no carecen de lo _necesario fisiológico_.

En lo moral, la igualdad la constituye el cumplimiento de las leyes y de aquellos deberes que, sin obligar legalmente, son moralmente obligatorios para todo hombre honrado. El que no perturba la sociedad con sus delitos, ni la familia con sus vicios, podrá ser mejor ó peor que otro, pero tiene la semejanza suficiente para ser declarado igual en todas las funciones sociales que no exijan más que moralidad. Administrará sus bienes ó los de otro, podrá ser tutor y curador, será apto para toda especie de contratos en las mismas condiciones que los más favorecidos, y su dignidad será respetada, y su palabra creída, y su testimonio hará fe. Cierto que en los millones de hombres que hay en estas circunstancias hay millones de diferencias; pero existe la semejanza bastante para que á ninguno se niegue aquella consideración y derechos que resultan de ser calificados de moralmente iguales para el fin que se propone la sociedad al clasificarlos. Las personales diferencias se tienen en cuenta para los casos especiales: cuando se necesita virtud, abnegación, heroísmo, no basta cualquiera; hay que buscar sobre el nivel común alguno que luche esforzadamente ó se inmole; pero en la generalidad de los casos no se exige á la de las personas más de lo que todos pueden y deben dar.

En lo intelectual se diversifican mucho más las diferencias por la división de trabajo; pero, prescindiendo de las aptitudes profesionales, artísticas, industriales y científicas, si los abogados y los ingenieros y los comerciantes se diferencian mucho entre sí, como hombres tienen muchas ideas y conocimientos comunes, que lo son también á otros menos instruídos. El que sabe leer bien aunque sea ignorante, leerá lo mismo que una persona instruída cuando sólo de leer se trate, y para pasar lista á una cuadrilla de obreros servirá lo mismo que el más eminente literato: lo propio puede decirse del que sabe escribir, aunque no sepa más, cuando es bastante este conocimiento, ó tenga el de la aritmética elemental, etc. En lo que se llama la masa del pueblo podrá no haber suficiente conocimiento del bien y del mal para hacer leyes, pero se le supone el bastante siempre que se la

declara obligada á obedecerlas: no pueden en justicia ser igualmente obligatorias para todos si no son igualmente comprendidas en aquello que es indispensable conocer para obedecerlas. El primer jurisconsulto de la nación y el más rudo labriego tienen _igual_ el conocimiento _suficiente_ para saber que deben respetar la propiedad ajena, y con razón son declarados iguales ante la ley penal, y penados si la infringen. El ejercicio de los derechos civiles exige, no sólo cierto grado de moralidad, sino de inteligencia: al idiota ó al loco se le priva de ellos por incapaz del conocimiento necesario que tienen la inmensa mayoría de los hombres. Respecto á los derechos políticos, como la pasión suele mezclarse, no sólo en su práctica, sino en su teoría, no se ve tan claro cuándo el elemento intelectual no basta, y cuándo es suficiente; mas por difícil que sea investigarle, el hecho existe, y en este caso, como en todos, de la semejanza necesaria debe resultar la igualdad.

Aunque no lo notemos, la sociedad marcha en virtud, no sólo de necesidades y sentimientos semejantes, sino también de conocimientos, y sería imposible sin ellos. La ley que se promulga, el decreto que se da, la empresa que se organiza, el libro que se publica, el drama que se representa, la obra caritativa que se funda, parten de un conocimiento semejante, de un modo de ser intelectual bastante parecido y generalizado para que lo que se dice á un hombre sea inteligible para todos en grado suficiente. Sin esto, lo repetimos, la sociedad sería imposible, y una causa poderosa de desequilibrio y convulsiones sociales es el desconocimiento del grado de semejanza intelectual necesario para establecer igualdad, negándola cuando debía concederse ó concediéndola cuando debería negarse. Semejanzas y diferencias condicionan la sociedad humana, é importa mucho conocerlas bien para que las igualdades que se establezcan ó se rechacen sean consecuencias lógicas y estables, y no contradicciones pasajeras.

El _mínimum_ de semejanza intelectual necesario para realizar la igualdad, lo mismo que el moral y el físico, no permanecen estacionarios, sino que caminan á medida que la sociedad progresa. Lo _necesario fisiológico_ del hombre primitivo no basta para que viva el ciudadano: la ignorancia más completa puede pasar por sentido común, y aun por buen sentido en un país bárbaro, y no en una nación culta: un salvaje distinguido por su moralidad estará tan por debajo del nivel general en un pueblo civilizado, que con los mismos procederes que le hacían recomendable en su horda, irá á presidio. No hay, pues, que buscar en el arsenal de la historia armas que tal vez son inútiles, ni hablar de la naturaleza humana como de cosa eternamente idéntica y totalmente inmodificable. Cierto que el hombre sobre la tierra tiene condiciones de que no podrá salir nunca; cierto que no podrá respirar sin oxígeno, ni ser moral sin justicia, ni feliz sin amar alguna cosa; pero dentro de los límites que no podrá traspasar jamás tiene movimientos de bastante amplitud, y variaciones de bastante trascendencia, para que no se llame á la simetría inmóvil orden natural, y ley de la historia á reglas establecidas sin estudio suficiente de la naturaleza humana.

De los grados de semejanza que bastaron ó no en un país, no puede inferirse los que serán indispensables en otro que se halla en condiciones diferentes. Así, por ejemplo, donde la religión autoriza las castas y forma una con el sacerdocio, será necesaria mayor semejanza, mucho mayor, para establecer una igualdad cualquiera, que en el pueblo que llama á Dios padre y fraterniza en su amor, y no admite diferencias ante su ley y eterna justicia. En los que se hallan en este caso puede haber desigualdades enormes; se necesitarán á veces, para suprimirlas, no sólo _semejanzas suficientes_, sino _superioridades indudables_; pero esto será efecto de otras causas que neutralicen la influencia de la religión. Prescindiendo de su influencia ó de otra poderosa, podrán suponerse facilidades que no existen ó calificar de insuperables obstáculos que se pueden vencer; pero á pesar de contradicciones aparentes, siempre será un hecho cierto la influencia recíproca de los elementos físico, moral é intelectual, y que es inútil, cuando no hay la semejanza necesaria, decretar la igualdad, y peligroso negarla cuando existe semejanza suficiente.

CAPÍTULO II.

¿QUÉ LÍMITE DEBE TENER LA DESIGUALDAD?

La desigualdad que está en la organización del hombre, es una condición de la sociedad; pero es condición humana querer justificar el abuso de las cosas con la necesidad de su uso, y exagerar hasta la injusticia lo que en su origen es justo. La desigualdad de las condiciones es necesaria, es buena contenida en ciertos límites, pero cuando los pasa es inicua y es absurda.

Cuando existe la esclavitud de la ley ó la de la miseria; cuando con éste ó con el otro nombre hay castas en la sociedad; cuando entre las clases se abren abismos que es imposible salvar, el filósofo que estudia el corazón humano observa cómo se envilece y se deprava, y el que estudia los fenómenos sociales nota la gran perturbación que en la sociedad se introduce.

Ya hemos visto en la primera parte de este escrito cómo se desmoralizan las clases cuando se aislan unas de otras, é inútil es advertir que el aislamiento es tanto mayor cuanto más grande es la desigualdad. A los desórdenes que una desigualdad

exagerada, depravando los sentimientos, introduce en el mundo moral, hay que añadir los que llevan al mundo económico el lujo y la miseria.

No puede entrar en el plan de nuestra obra extendernos en consideraciones acerca de los males que en pos de sí llevan la miseria y el lujo, males de que, por otra parte, han hablado largamente célebres autores, tanto sagrados como profanos; pero no podemos menos de detenernos un momento á recordar una verdad que, por más sencilla y trivial que parezca, se desconoce y se niega por personas ilustradas en otras materias, á saber: _el lujo de los ricos es siempre perjudicial á los pobres_.

El lujo, dicen sus partidarios, es útil, sostiene la industria y el comercio. Suprimid los espejos de Venecia, los encajes de Bruselas, los jarrones de Sèvres, las alfombras rizadas, los dorados techos, los brillantes carruajes, las joyas de labor exquisita; ¿qué va á ser de tantos miles de familias como ganan el pan haciendo esas prodigiosas superfluidades? Ya lo veis: el lujo da de comer á innumerables familias, que sin él quedarían en la calle; el lujo es útil, ¿á qué declamar contra él? No somos declamadores, ni aun queremos dirigirnos al corazón presentando el horrible é inmoral contraste que ofrecen esas primorosas obras que, para contentar los vanidosos caprichos de la opulencia, salen de manos de la miseria; sólo queremos hacer notar que, cuando en medio de una familia hambrienta y desnuda vemos un objeto cuyo principal valor consiste en el ímprobo trabajo de sus individuos, un objeto brillante, preciosísimo, de una perfección fabulosa, cruel contraste con todo lo que le rodea, luz siniestra en un cuadro sombrío, insultador de dolores, provocador de iras, recuerdo constante de placeres y de goces, de que el pobre es desdichado instrumento, si la indignación y la lástima se elevan en nuestra alma, no es un afecto inmotivado; y meditando sobre aquella escena, no decimos como en presencia de otras tristes: «Está en el orden de las cosas», sino: «Está en la insensatez de los hombres».

El lujo es una inevitable consecuencia de la desigualdad de condiciones en un pueblo civilizado, lo sabemos; pero désele la sanción de la necesidad y no la de la consecuencia; dígase: «Es un mal inevitable»; y no: «Es un bien, y como tal debe fomentarse».

Veamos qué nos dice la Economía política de las ventajas que el lujo tiene para los pobres que trabajan en satisfacer sus caprichos. La humanidad es una gran familia; sus individuos se dedican: unos á labrar la tierra, otros á cambiar sus productos, otros á fabricar vestidos, etc., etc. Fijémonos en un grupo cualquiera, por ejemplo, el que está encargado de hacer camisas. Unos hilan y tejen telas ordinarias, otros medianas, otros finas, finísimas otros. Aquí se cosen camisas de munición, allá con más esmero; en otra parte se bordan, adornándolas con caprichos primorosos. Ved un día y otro, y una y otra noche, aquellas pobres mujeres perdiendo la vista y la paciencia, haciendo con la aguja _labores_ como pintadas, sacando hilos que apenas se ven, pegando encajes. Ved aquel hombre que lleva una camisa que supone tres, cuatro, seis meses de trabajo; ved aquellos otros que no tienen camisa. El tiempo que se gasta en hilar y tejer y bordar aquella tela finísima que ha de cubrir á uno, hace falta para preparar la más tosca que debía cubrir á los otros: en la sociedad, como en una familia mal gobernada que no tiene más que lo preciso, cuando malgasta una parte de su haber en superfluidades, carece luego de las cosas necesarias. El valor de un objeto cualquiera no es, por regla general, más que la representación del trabajo que ha costado. ¿Cuántas casas modestas pueden hacerse con el trabajo que necesita un palacio ó con el capital, que es lo mismo? Y como el capital de la sociedad, dividido por el número de individuos que la componen, basta apenas para cubrir sus primeras necesidades, en la balanza de la economía social quitáis á lo necesario todo lo que añadís á lo superfluo. ¿Qué habían de hacer los que viven de las industrias que satisfacen el lujo? Dedicarse á las que tienen por objeto cubrir la necesidad. Mientras se borda una sábana, se pueden coser ciento ó mil, y así de las demás cosas. Es decir, que ese lujo tan ventajoso para la industria, aun prescindiendo de lo que desmoraliza, de lo que insulta, de lo que envanece y de lo que irrita, considerándole sólo bajo el punto de vista de la producción de la riqueza, es un gran perturbador de la economía social, que arranca los brazos á las tareas de la necesidad para dedicarlos á las tareas del capricho.

Habiendo admitido como necesaria la desigualdad de condiciones, y siendo el lujo su consecuencia, ¿por qué declamamos contra él? ¿Pero no se debe buscar ningún correctivo á los males que no pueden cortarse de raíz? En vez de poner diques á su fatal corriente, ¿deberá abrírseles ancho paso para que inunden la sociedad y la trastornen? ¿Es lo mismo que haya un desdichado ó que haya ciento, que corra una lágrima ó que una multitud de criaturas viertan el llanto de la desesperación? Arrojemos con triste silencio en la sima de la necesidad todas las víctimas que pide para llenarse, pero no arrojemos ni una más. ¿Es tan corto el tributo de dolores que la naturaleza de las cosas exige para que vayamos á aumentarle insensatos ó crueles?

La desigualdad de condiciones es justa porque es necesaria; pero allí donde acaba la necesidad acaba el derecho. Así, por ejemplo, es necesario que se respete la propiedad de los bienes legalmente adquiridos. Es necesario que se deje á su dueño la facultad de disponer de ellos en favor de quien le parezca; pero es absurdo que se favorezca la acumulación exagerada de la propiedad con leyes perjudiciales á la sociedad y que no están _en la naturaleza de las cosas_. Las leyes todas, ¿no deberían

tener la tendencia altamente filosófica y moral de restablecer el equilibrio siempre que se rompe inclinándose la balanza del lado de la acumulación de la riqueza? No somos niveladores; nadie que haya seguido nuestro pensamiento podrá acusarnos de tales. Queremos eminencias en el mundo social, pero proporcionadas como las del mundo físico. Queremos montañas que atraigan las aguas del cielo y dirijan su curso sobre la tierra, pero no tan altas que no se pueda respirar en su cima y que nos roben la luz del sol.

Los límites de la desigualdad de condiciones están en la necesidad y en la justicia. ¿La justicia y la necesidad no son una misma cosa? La justicia puede no ser necesaria cuando el mayor número no la cree tal. Además, si el sentimiento de la justicia es eterno como innato en el hombre, su fórmula varía: la justicia de hoy no es la de hace diez y ocho siglos, como la del siglo XXX no será la nuestra. La fórmula de la justicia es el resultado de las ideas, y debe variar á medida que éstas cambian.

La necesidad que constituye el derecho de la sociedad, ¿constituye también el del individuo? Unos lo afirman, lo niegan otros, y los de más allá admiten el principio con esta salvedad: «En tanto que su aplicación sea posible». Y como las palabras necesario y posible son de una elasticidad suma, podremos entrar en discusiones interminables; veamos si por otro medio llegamos á ponernos de acuerdo acerca de los límites que la justicia impone á la desigualdad de condiciones, y hasta qué punto una necesidad puede constituir un derecho.

Casi todos los grandes errores son grandes verdades exageradas ó torcidas, y este origen, que hasta cierto punto los ennoblece en la esfera moral, los hace más peligrosos en la práctica. Un error que lo es por sus cuatro costados, digámoslo así, no es difícil de demostrar; pero cuando está emparentado con la verdad y enlazado con grandes principios de justicia, el problema se complica mucho. Los que afirman y los que niegan se mezclan en la lucha, y más de una vez el golpe dirigido á un contrario cae sobre un amigo. Luego, al ostentar los trofeos conquistados en el combate, se nota que el que se apoderó de la verdad arrastró, confundido con ella, una parte del error, y el que hizo presa en éste lleva unida á él una gran porción de verdad: algo de esto se nota en los que niegan y sostienen el principio de igualdad; sus errores están mezclados con verdades, y de ahí la dificultad de poner en claro los unos y las otras.

Imaginemos tres grandes hombres, por ejemplo: Hernán Cortés, Watt, Leibniz; y tres hombres vulgares: un soldado que sólo sabe manejar sus armas, un obrero ocupado toda su vida en mover una lima, un cajista que sin saber leer coloca maquinalmente las letras en el orden en que las ve colocadas. ¿Estos hombres son iguales? ¡Qué absurdo! ¿Y no habrá alguna circunstancia de la vida en que estos seis hombres sean iguales en alguna cosa y tengan derechos iguales? Veámoslo.

Debemos advertir á los fanáticos de la desigualdad, que vamos á presentar, como base de nuestro razonamiento, un ejemplo sumamente favorable para ellos. Ponemos enfrente la plebe y la aristocracia de la naturaleza, no la de la fortuna, mas, colocamos al _genio educado_ enfrente _del sentido común sin educar_: no se dirá que esquivamos las dificultades.

Hé aquí nuestros seis hombres encerrados en una habitación, y ocupados según su _necesidad_ los de abajo, según su _aptitud_ los de arriba. De repente la composición del aire cambia en términos que se hace irrespirable; todos dejan sus trabajos, sienten angustias mortales, sucumben si no salen de allí. ¿Qué se infiere de esto? Que el conquistador de Méjico y el oscuro soldado, el gran mecánico y el ignorante obrero, el profundo filósofo y el que sin comprenderlos imprime sus pensamientos, tienen igual necesidad de aire respirable, y por lo tanto igual derecho á él. Esta concesión la haremos sin dificultad; hay aire respirable gratis por todas partes, y, no obstante, debemos ser muy cautos al hacer concesiones, porque la legitimidad de un derecho no está en la facilidad de satisfacerle, sino en su justicia: suponemos que, á pesar de nuestra advertencia, nuestros adversarios, porque probablemente los tendremos, conceden la _igualdad de derechos respecto á la atmósfera_.

Nuestros seis hombres se hallan en un subterráneo reducidísimo, con una pequeña abertura en la parte superior por donde apenas entra aire puro para el que está cerca de ella; los gases mefíticos descienden á la parte inferior y sofocan al desdichado que allí permanece mucho tiempo. Los tres grandes hombres, ¿tendrán _derecho_ á excluir del aire respirable á sus compañeros, ó estarán en el _deber_ de alternar con ellos en el bien de respirar libremente y en el mal de respirar con dificultad? Si los hombres eminentes son los más fuertes y emplean la fuerza en privar á sus compañeros de una condición de vida, con todo su saber y su mérito, ¿no nos parecerán miserables, mil veces acreedores á la suerte de los que inmolan? Parece que en esto todos debemos estar conformes, y que si antes quedó consignada _la igualdad de derechos á la atmósfera_, ahora deberemos añadir: _en cualquiera circunstancia_. Prosigamos.

Nuestros seis hombres reclusos se hallan privados de alimento por espacio de dos días; una mano amiga les proporciona manjares insuficientes para saciar su hambre voraz, pero bastantes á impedir que sucumban si los reparten con equidad.

¿Deberán distribuirlos en razón del mérito ó de la necesidad de cada uno? ¿Estará bien que Watt deje morir de hambre al obrero por saciarse con su ración, diciendo: «Soy el que ha creado la máquina de vapor»? Todos estaremos de acuerdo en que no. Por eso en un buque donde escasean los víveres, en una plaza sitiada, la media, el tercio, el cuarto de ración se da á todos igualmente conforme á su necesidad y no conforme á su categoría. ¿Qué quiere decir esto? Esto quiere decir que la sociedad, al menos la sociedad cristiana del siglo XIX, admite en principio que en un buque, en una plaza sitiada, _mientras haya quien carezca de lo estrictamente necesario, ninguno tiene derecho á lo superfluo_. ¿Y qué se hace de este principio cuando los hombres salen de un estrecho recinto para vivir libremente donde les parezca? Este principio, ¿no puede salir de los muros de una prisión, de la cubierta de un buque ó del recinto de una plaza? ¿Qué es el derecho? Un principio de justicia sancionado tácita ó expresamente por el mayor número. ¿Y la justicia varía en una misma época y en un mismo pueblo según la localidad? Pero se dirá: varía la situación, y no se puede aplicar la misma ley á casos diferentes. En las circunstancias normales, todo el mundo tiene aire para respirar y mercados abundantes donde puede proveerse de lo necesario. ¿Todo el mundo? ¿Y los que viven hacinados en una miserable buhardilla, en un húmedo sótano? ¿Y los que no tienen con qué comprar nada en esta plaza cuya abundancia es tan tranquilizadora para la sociedad? La miseria establece un bloqueo bien estrecho alrededor del miserable. ¿Qué diferencia existe entre el que no halla qué comprar y el que no tiene medios de comprar lo que halla? Una tan sólo: que para el primero debe ser mucho más fácil la resignación que para el segundo.

Mas se dice: «No hay muertes por asfixia en las reducidas moradas que la miseria habita, y por regla general nadie se muere de hambre en las calles ni en las plazas». Cierto, la miseria, por regla general, no presenta casos _fulminantes_. La atmósfera infecta, la humedad, la mala alimentación, la falta de abrigo, el excesivo trabajo, alteran la salud mucho antes que quiten la vida. Hay una enfermedad larga, muy larga, que tiene un nombre griego, con el cual la sociedad se tranquiliza completamente; á lo que parece, no es responsable más que de las muertes repentinas, que no estén bautizadas por la Patología.

¿Qué hacer para obligar á la sociedad á que sea lógica y admita las consecuencias de sus principios? ¿Formaremos una larga lista de derechos? ¿Reclamaremos ese derecho que se llama sufragio universal, ó el derecho al trabajo, etcétera, etc.? No, ciertamente; los abandonaremos sin dificultad, pidiendo sólo el derecho á la vida. Pero ¿es esto practicable? Hasta donde lo sea será justo, porque _derecho imposible_ es la fórmula de todas las revoluciones abortadas, y nosotros no queremos revolución más que en las ideas; en las cosas queremos reforma. Queremos que haya pobres y ricos, pero no miserables y potentados. Nos resignamos á que unos anden á pie y otros en coche; pero no que unos vayan descalzos y otros que tengan media docena de carruajes. Queremos que unos se calienten en un barreño con lumbre, y otros á una magnífica chimenea; pero no que unos se mueran de frío y otros gasten sumas inmensas para tener en la zona templada ó glacial plantas exóticas á la temperatura de los trópicos. Y ¿qué somos nosotros que estas cosas queremos? ¿Llevamos el nombre de alguna escuela de esas cuyas doctrinas amenazan el orden social? Nada de eso; somos simplemente cristianos y vivimos en el siglo XIX.

No abogamos por una igualdad absurda é imposible; pero queremos que se reconozca el principio del derecho de igualdad á la vida, y que las leyes todas tengan la tendencia de hacer imposible, ó por lo menos más y más difícil, lo que pudiera llamarse los delirios del lujo, y cuya reacción son los sangrientos extravíos de la miseria.

Y este _derecho_ á la vida, ¿cuándo podrá convertirse en _hecho_? Este derecho, como todos, será practicable cuando esté en el buen sentido, y practicado cuando esté en el sentido común. En cuanto á los peligros de sentar ciertos principios más fáciles de llevar á la pasión que á la práctica, los deploramos, pero están en la naturaleza de las cosas. Desde que un derecho se establece como tal por los pensadores, hasta que se admite por los más y pasa á ser hecho, transcurren á veces siglos de agitación y de lucha entre los que le reclaman como _justo_ y los que le niegan como _imposible_. Lucha tan inevitable como las epidemias, las erupciones volcánicas y las tempestades. De ningún pensador referirá la Historia que dijo: _la justicia sea y la justicia fué_. No; la justicia para brillar ha menester largos combates, sangrientos, pero menos dolorosos que el reinado tranquilo de la iniquidad.

CAPÍTULO III.

CONSECUENCIAS DE LA DESIGUALDAD SOCIAL DEL HOMBRE Y LA MUJER.

No puede entrar en nuestro plan, porque sería salirnos del asunto que tratamos, discutir sobre si las facultades intelectuales de la mujer son ó no inferiores á las del hombre; basta á nuestro propósito considerar:

1.º Si tiene la mujer más facultades intelectuales que cultiva;

2.º Si de la falta de cultura resulta para ella desigualdad;

3.º Si esta desigualdad se gradúa de modo que la rebaje respecto al hombre;

4.º Consecuencias de que esté rebajada.

¿TIENE LA MUJER MÁS FACULTADES INTELECTUALES QUE CULTIVA? Hay opiniones acerca de si conviene ó no que la mujer se instruya, y también sobre el alcance de su inteligencia; pero no respecto al hecho constante y comprobado de que es apta para trabajos intelectuales, industriales y artísticos á que no se había dedicado hasta aquí y á que no se dedica aún en los pueblos poco cultos: en los más civilizados la mujer adquiere conocimientos científicos, artísticos, mercantiles é industriales que prueban de una manera concluyente su aptitud para ellos, y más, á medida que se le dan mayores facilidades para aprender.

En España, aunque poco, también ha progresado la enseñanza de la mujer, poniendo de manifiesto que tiene aptitud para las ciencias, las artes, la industria y el comercio. Las leyes, las costumbres, su ignorancia misma, se oponen en muchos países á que se instruya; pero en ninguno se ha visto que sea incapaz de aprovecharse de la instrucción á medida que la recibe y que no se eleve en la escala intelectual. En los Estados Unidos, en Suecia, en Inglaterra, en Rusia, donde quiera que no se le prohibe la actividad intelectual, la despliega iniciándose en las ciencias, ejerciendo artes á que exclusivamente se dedicaban los hombres y tomando parte en los procedimientos de la industria, en las operaciones mercantiles, etc., etc. Prescindiendo, según dejamos indicado, de si sus facultades intelectuales son iguales ó equivalentes á las del hombre, parece fuera de toda duda que tiene más que ha cultivado hasta aquí y que cultiva aun en los pueblos donde mejor se la instruye.

¿DE LA FALTA DE CULTURA RESULTA PARA LA MUJER DESIGUALDAD RESPECTO DEL HOMBRE? Basta formular la pregunta para determinar la respuesta afirmativa. Es patente la desigualdad que resulta entre dos personas de las cuales una estudia, aprende, sabe, y la otra no recibe instrucción alguna. La esposa del hombre de ciencia, del artista, del industrial, del comerciante, nada entiende, por lo común, ni sabe de la profesión de su marido: unidos están por el afecto; intereses comunes tienen, y, no obstante, en las cosas del entendimiento se hallan separados por la diferencia esencial que existe entre quien sabe lo necesario y el que lo ignora todo. Por preocupado que esté un hombre con un problema cualquiera, no lo consultará con su mujer, ni aun le hablará de él, porque, en general, no lo comprendería mejor que la criada. Existe, pues, entre el hombre y la mujer de la misma clase una desigualdad evidente que resulta de la ignorancia de ésta y la instrucción de aquél; y como el elemento intelectual, si es influído, como sabemos, también influye en el moral y el físico, las desigualdades de inteligencia determinarán otras, y tanto más, cuanto la civilización esté más adelantada y la cultura sea mayor. Sucede respecto á los sexos algo parecido á lo que acontece con las clases: no las hay en una horda salvaje, y se van formando y aumentando sus diferencias á medida que el pueblo se civiliza. Así también la desigualdad intelectual que no existe entre la mujer y el hombre cuando la ignorancia es común á entrambos, va graduándose á medida que el saber se aumenta si no se instruye más que uno solo. Y no es necesario recurrir á la Historia para estudiar en sus diferentes épocas el hecho, sino que puede observarse hoy en cualquier pueblo, porque en todos existen, aun simultáneamente, clases cuya cultura constituye gran diferencia entre el hombre y la mujer, y otras en que son igualmente rudas las personas de los dos sexos.

Este último caso comprende un número menor del que á primera vista se creería, porque aun entre el hombre y la mujer que parecen igualmente rudos, suele tener el primero alguna mayor cultura. Se pone algún mayor cuidado en enviarle á la escuela, y sabe leer, escribir y contar con más frecuencia y algo mejor. Además, la educación industrial del hombre, aun del pueblo, es muy diferente de la que recibe la mujer, á quien están vedados casi todos los oficios que exigen arte y aprendizaje. Son muy desiguales los conocimientos de la obrera y los que tiene un oficial ó maestro de cualquier oficio, exigiendo la práctica de la mayor parte de ellos conocimientos ó habilidad que están muy por encima de la educación industrial de las mujeres: todo esto es bastante sabido para que no sea necesario insistir más.

LA DESIGUALDAD QUE EXISTE ENTRE EL HOMBRE Y LA MUJER, ¿REBAJA Á ÉSTA? las evidentes desigualdades que hemos recordado y todo el mundo sabe, constituyen _inferioridades_ respecto á la mujer. ¿Cabe dudar que el que _ignora_ es inferior al que _sabe_, en cualquier asunto, lo mismo que se trate de escribir un libro ó de imprimirle, de hacer un puente ó un par de botas? La inferioridad de la mujer no se limita á una ú otra esfera social, sino que llega á todas; no sabe la teoría de las ciencias ni la práctica de las artes y oficios; para la obra intelectual no se la admite, y para la artística é industrial sólo en pocos casos y en la clase ínfima.

De esta inferioridad científica y artística resultan otras. No siéndole posible á la mujer el ejercicio de las profesiones, artes ú oficios lucrativos, se agolpa, puede decirse se apiña alrededor de los pocos trabajos manuales á que puede dedicarse, y cuyo precio se rebaja en términos que hacen, por lo común, imposible que viva de su trabajo; la depreciación de éste resulta de una concurrencia

desesperada, de la poca consideración que merece la trabajadora y de otras causas que no hay para qué investiguemos, bastándonos aquí consignar el efecto, que es la imposibilidad de que la mujer con su trabajo gane lo suficiente para vivir.

Inferior en la esfera intelectual y en la artística, con una inferioridad tan general y constante, la mujer tiene que resultar, y resulta, rebajada.

Pasadas las idolatrías del amor, y prescindiendo de ciertos sentimientos caballerosos y tiernos afectos de familia, la mujer ocupa un lugar muy inferior al hombre en la opinión, en la ley, en las costumbres, y su desigualdad llega á un grado que la rebaja.

Nos causa extrañeza, repugnancia ó indignación el proceder de los salvajes que abusan de la fuerza para hacer trabajar á sus mujeres mientras ellos huelgan, convirtiéndolas en bestias de carga; pero el proceder de los hombres civilizados hasta aquí, si es menos brutal, no ha sido mucho más justo. ¿No es un hecho de fuerza y un abuso de ella la prohibición de que las mujeres se dediquen á profesiones y oficios para los cuales tienen reconocida aptitud? La desigualdad que resulta, ¿no es consecuencia de la _muscular_ más bien que de la intelectual, y un verdadero salvajismo el no dejar á las mujeres más que aquellos trabajos que por muchas circunstancias han llegado á ser abrumadores para ellos?

Las mujeres, infinitamente más ignorantes y más pobres que los hombres, han de ser menos consideradas y aumentar su descrédito en estados sociales donde el saber y la riqueza tienen mayor importancia cada día. Prescindiendo de excepciones, y observando lo que hay en el fondo de apariencias que engañan, la regla y la realidad es que la pobreza intelectual de la mujer la lleva á la miseria económica, lo cual la rebaja, y que, en circunstancias desfavorables y frecuentes, de su penuria y desprestigio resulta su abyección.

CONSECUENCIAS DE QUE LA MUJER ESTÉ REBAJADA. Las consecuencias de la desigualdad que deprime y rebaja á la mujer son:

Legales;

Físicas;

Intelectuales;

Morales.

Las enunciamos en el orden inverso de su importancia.

Consecuencias legales. La mujer fué considerada como esclava, primero; después, como sierva, y por último, como menor: todas las legislaciones de los pueblos civilizados se han modificado en favor suyo y con tendencia á igualarla; pero esa tendencia, más ó menos marcada, realizándose más lentamente ó con mayor rapidez, no es todavía un hecho en pueblo alguno, porque no hay uno solo en que la mujer y el hombre sean iguales ante la ley. Sin derechos políticos, mermados los civiles, incapacitada legalmente para las profesiones y para los cargos públicos, en el veto de la ley halla el reflejo de la opinión y un insuperable obstáculo á su actividad y razonable independencia. Proclamada legalmente su inferioridad intelectual, tenida, en parte, como menor, estas circunstancias no son atenuantes cuando delinque: el legislador, que la considera inferior para utilizar las ventajas sociales, la trata como igual al hombre para penarla, y aun en ciertos casos le exige responsabilidad mayor y la pena más severamente. La ley, que le cierra las puertas de los establecimientos del Estado, le abre las del lupanar; la ley, que no le permite publicar un libro sin permiso de su marido, no le exige el de su padre para entrar en la casa de prostitución legalmente autorizada.

Consecuencias físicas. La mujer, como trabajadora, no está ni aun al nivel de los obreros menos inteligentes y más débiles respecto al salario. Es tal su desprestigio y el desdén que inspira, que la misma obra, sin más que porque ella la hace, se paga menos que si la hiciera el hombre; cualquiera labor que realice, cualquier cargo que desempeñe, es siempre con rebaja en la retribución respecto á las personas del otro sexo que prestan igual servicio; y esto no es sólo un hecho, sino que parece un derecho, y cosa muy natural que un hombre gane más que una mujer.

Como tales hechos son generales y constantes; como las mujeres están incapacitadas para el ejercicio de las profesiones y oficios lucrativos; como los pocos trabajos á que pueden dedicarse están mal retribuídos, y peor si son desempeñados por ellas; como además no hallan trabajo, resulta que su situación económica es aflictiva; que no teniendo medios de subsistencia, no pueden tener independencia; que se casan de cualquier modo, se prostituyen _ó se matan para ganar la vida_, según una frase que parece carecer de sentido y le tiene bien terrible.

De las diez ó doce horas de trabajo continuo y sedentario, con el cual la mujer no gana para procurarse lo necesario fisiológico, resulta una vida que se pierde ó cuando menos se debilita por el exceso de fatiga y falta de alimentación. Es raro, muy raro, que pronto ó á la larga no enfermen las mujeres que viven de su trabajo, y más raro aún que tengan la robustez necesaria para que, si llegan á ser madres, no engendren una prole raquítica. Esos niños endebles y escrofulosos pueden serlo por muchas causas; pero una muy poderosa es que deben la existencia á madres que han trabajado mucho y comido poco, y con su sangre y su leche empobrecida dejan una prole cuya debilidad es el reflejo de su desdicha. La inmensa mayoría de las mujeres necesita trabajar para vivir; se halla sin trabajo ó tiene que aceptar los rudos, peor retribuídos y más mecánicos; siendo considerada cual máquina, débil; necesitando mucha fuerza para transmitir una parte á sus hijos como madre y como nodriza, y no teniendo esa fuerza, de su debilidad resulta la de la prole y una concausa poderosa para la degeneración de la raza.

La situación económica de la mujer, su falta de recursos propios, dan también otro resultado, los matrimonios prematuros, cuyas consecuencias físicas son deplorables. El hombre suele esperar, para casarse, á concluir su carrera, á tener un oficio ó modo de vivir, á quedar libre del servicio militar, etc., etc.: la mujer, que no tiene más carrera que la del matrimonio, lo celebra, por regla general, en cuanto halla con quién. Aunque sea muy joven, aunque sea una niña, aunque esté muy lejos de la plenitud de vida necesaria para transmitirla robusta, será madre de hijos endebles, y ella se debilitará ó perderá tal vez la salud. Esta consecuencia física del estado social de la mujer tiene mayor importancia de la que tal vez se supone.

Resultado en gran parte de la miseria y de la ignorancia es la prostitución, cuyas consecuencias físicas son envenenar las generaciones y degradar las razas, sin que basten á evitarlo las llamadas policía de costumbres y leyes de higiene. Habrá virus físico mientras haya cáncer moral, y cáncer moral en tanto que la masa de las mujeres sea tan pobre y tan ignorante, esté tan rebajada, tan abajo, en la escala social, que al menor tropiezo se halle en peligro inminente de caer en la prostitución.

Consecuencias intelectuales.--Pensadores, filántropos, hombres ilustrados y caritativos, amantes de la ciencia y de la humanidad, no comprenden cómo ésta no va más de prisa por las vías del progreso. Academias, cátedras, liceos, tribunas, escuelas, libros, revistas, ¡cuántos medios de difundir rápidamente la ciencia, que no obstante se comunica tan despacio! ¿Cuál será la causa? Muchas puede haber; pero una, y muy poderosa, es sin duda la ignorancia de la mujer, punto de apoyo para el error, obstáculo para la difusión de la verdad. El publicista la demuestra, cree demostrarla á todos, sin hacerse cargo de que las mujeres en general, ó no ven la demostración, ó no la comprenden, y que lo escrito llega á ellas muchas veces traducido por quien de propósito ó sin querer lo traduce mal.

Al calcular la suma de instrucción respecto á ciertas clases, no se tiene en cuenta que la mitad de las personas que pertenecen á ellas no son instruídas. La madre, la esposa, la hija, la hermana del hombre de ciencia, lejos de ayudarle á difundirla, es indiferente, se convierte en un obstáculo para que se difunda, ó se hace aliada de los que la combaten: esto tiene excepciones, y más en los pueblos más cultos, pero en los que lo son poco, es la regla. Aunque la posición social de la mujer es muy desventajosa, no deja de ejercer grande influencia respecto á la familia, en la que no propaga verdades que desconoce ó que tiene por errores. Además, la gestión económica de la casa es suya, y no es raro que auxilie pecuniariamente á los que combate su marido, y que para coadyuvar á difundir las ideas de éste no pueda hacer nunca economías. Si el antagonismo llega á convertirse en lucha, sucede muchas veces que el hombre se cansa y cede, y por lo que él llama paz contribuye pecuniariamente al poder de los que le hacen la guerra. Lejos de haber unidad de pensamiento en la familia respecto á muchas cosas esenciales, las mujeres, ó no le tienen, ó piensan de distinto modo que los hombres.

Si la mujer se halla sola, viuda ó soltera, y tiene bienes de fortuna, todavía está en peor situación y más expuesta á ser instrumento de error, con su riqueza y su ignorancia. Bajo pretexto de guiarla, no faltará quien la extravíe y se cobre bien el trabajo de persuadirla de que va por el camino mejor. Como si la mujer no es apta para adquirir lo es para heredar, la herencia, en las clases acomodadas, pone á su disposición capitales considerables, que en parte, en mucha parte, se emplean contra la verdad. Cuando falta armonía entre los medios materiales é intelectuales, resulta siempre daño: el obrero se embriaga y se corrompe; la mujer es explotada en provecho del error, y esclava de él, se cree libre porque tiene doradas las cadenas.

Así, pues, rebajada la mujer bajo el punto de vista de la inteligencia, contribuye poderosamente á rebajar el nivel intelectual del hombre; es una red invisible para muchos, pero tupida y resistente, en que se aprisiona el pensamiento, resultando que la civilización camina como un cojo, y cae con frecuencia por la desigualdad excesiva de los miembros que le sirven para marchar.

Consecuencias morales.--La posición social de la mujer, que la reduce á la ignorancia, á la pobreza, á la miseria, á la dependencia, ha de ser fatal á su dignidad, ha de rebajarla moralmente, y en efecto, la rebaja: si así no sucediese, sería preciso

concluir que el miserable ignorante es el que está en mejores condiciones para ser virtuoso. Las estadísticas criminales de todos los países ponen de manifiesto que es mucho mayor el número de hombres penados que de mujeres; pero el nivel moral de éstas no sube en la proporción que baja el número de los que entran en las penitenciarías. Las estadísticas criminales prescinden de un dato de que no pueden prescindir las morales; prescinden de la prostitución, que la ley tolera ó autoriza, y que la moral condena. Una prostituta está moralmente más rebajada y es socialmente más perjudicial que gran número de las personas condenadas por los tribunales.

La prostitución de que hablamos como daño físico, lo es mucho mayor moral; y si los males del alma fuesen perceptibles como los del cuerpo, no habría leproso tan repugnante como una prostituta.

Ese azote físico y moral de las sociedades, ¿sería posible que existiera más que como excepción rara, si la mujer no fuera miserable, física é intelectualmente, y no estuviese rebajada en concepto del hombre y en el suyo propio? La desigualdad social excesiva de los sexos hace, entre otros males, el de disminuir la dignidad y anular en parte la personalidad de la mujer: cuando las condiciones de ésta la ponen en el caso de descender más, baja aún, y resulta la prostituta. Lo que hay en ella de más repugnante, de verdaderamente monstruoso, resulta de su falta de personalidad. Forma parte de la sociedad; tiene derechos civiles; es hija, madre, hermana, hasta esposa, y _no es persona_: no, no es persona; por eso la desprecia el último hombre aunque sea un criminal; por eso es tan abyecta y repulsiva. Y como esta monstruosidad moral no es un hecho raro; como son miles, muchos miles de criaturas las que inoculan su virus y salpican su ignominia sobre la sociedad que las tolera, vienen á constituir un elemento perturbador en alto grado, poderoso, constante é incompatible con la moral. En los atentados contra ella se hallan por todas partes cómplices livianos, codiciosos ó ignorantes, y el hecho se repite, se generaliza, hasta el punto de que se atreve á llamarse derecho, y vive al amparo de la ley, y hay una cosa que es al mismo tiempo abominable y lícita. Todo esto sucede por contagio; son las emanaciones de la podredumbre, que, por ser tanta, vicia la atmósfera y empaña la esfera, que debiera ser inmaculada, desde donde da sus oráculos la justicia.

Como la prostituta es físicamente tan repugnante y dañina, hace apartar la vista ó que se la mire principalmente por esta fase, y no llama bastante la atención de todos hacia su deformidad moral. Y en ella es donde principalmente debemos fijarnos; porque el hombre está en su inteligencia y en su voluntad, y ofuscación de la una y perversión de la otra hay en todo daño que hace. En el causado por la mujer liviana hay maldad y absurdo, casi podría decirse irracionalidad, por ser completamente irracional un proceder que lleva consigo la perdición segura, inevitable y sabida de quien así procede.

Pero ¿cómo se verifica esto? ¿Cómo hay miles, tantos miles de criaturas que se lanzan á un daño cierto y conocido, que aceptan su perdición, que arrojan su cuerpo al muladar del vicio y se suicidan moralmente? ¿Cuál es la causa de que se repita tanto un hecho que parece tan preternatural y fuera de razón? Respecto á la mujer, este hecho como generalizado, como permanente, como verdadera calamidad social, no se explica por las pasiones y los instintos pervertidos y desenfrenados que, cuando más, producirían la prostituta como el ladrón y el asesino: decimos _cuando más_, porque, dada á la mujer la personalidad que hoy le falta, y la instrucción y medios de subsistencia que no tiene, habría de vencer para prostituirse más repugnancias, hacer peores cálculos, prescindir más de su verdadero interés que el hombre que infringe las leyes pasando á vías de hecho ó apropiándose lo ajeno. La naturaleza humana explica la prostitución de uno ú otro individuo, pero de masas no puede explicarse sino por el estado social, por la inferioridad que, según él, tiene la mujer respecto del hombre.

Sin llegar al extremo de la _mujer perdida_, frase gráfica con que se expresa que ha desaparecido moralmente; sin llegar á este extremo, la desigualdad social de la mujer tiene consecuencias deplorables. Es una de ellas el matrimonio prematuro, que si tiene inconvenientes físicos, también morales, haciendo esposas, madres, amas de casa, á criaturas sin la circunspección y la experiencia que no pueden tener los pocos años, é indispensables para la dirección moral de la familia y material del hogar. Aunque una mujer sea muy joven, aunque sea niña, si hay ocasión de casarla se aprovecha, porque podría no presentarse otra, y ella no tiene más carrera. Tardará aún años en ser mayor según la ley, en poder disponer para la venta de algunos metros de tierra; pero dispone del orden doméstico, del porvenir de sus hijos que no sabe educar, de la paz, de la dicha del hogar y del honor de su marido: todo esto se pone con frecuencia en manos de una niña. Es en parte falta de la ley; pero las leyes ya se sabe que son el reflejo ó el eco de las ideas y de las costumbres, y mientras la mujer no tenga verdadera personalidad, ni más posición social que la que le da el matrimonio, ha de apresurarse á contraerle.

Las mujeres, no sólo se casan pronto por tener prisa de casarse, sino que muchas veces se casan mal. El amor, la conveniencia de circunstancias y caracteres, no se atiende bastante, en ocasiones no se atiende nada, por considerar solamente la necesidad de tener una posición social, un sostén, una persona que provea al sustento de la que por sí no puede ganarle, y evitar la situación

precaria y tal vez aflictiva de la mujer soltera cuando sus padres han muerto y se han casado sus hermanos. Todos estos cálculos que tienen que hacerse, que es imposible que no se hagan, han de producir consecuencias morales deplorables, uniendo á los que no se unirían sin la especie de fuerza mayor, resultado de la inferioridad social de la mujer.

La desigualdad intelectual es también una causa perturbadora del buen orden y moralidad de la familia. No sólo se encomienda por completo á los extraños la instrucción del niño, sino que éste, vista la ignorancia de su madre, propende á desdeñarla, propensión que es una concausa de la falta de respeto que hoy menguan tantos otros motivos. La influencia de la madre, tan necesaria para el niño y para el joven, tiene que resentirse de su inferioridad intelectual, y si por muchas circunstancias no se disminuye, no es raro que sirva para extraviar al hijo que debía dirigir: el sentimiento, el instinto, no ordenados por la razón ilustrada, pueden arrastrar ciegamente ó retraer con cálculos egoístas.

Si la ignorancia es un mal en la madre, lo es también para la esposa, que no será la compañera de su marido siempre que entre ellos haya una gran desigualdad intelectual. Cuando el amor ha dejado ya de dar importancia á todas las fruslerías, ¿qué es el trato entre una persona instruída, seria, y otra ignorante y frívola? No puede tener aquella intimidad constante, resultado de una armonía que no existe, y el hombre busca la compañía de sus amigos, la mujer, de sus amigas, porque es natural complacerse en la sociedad con sus iguales. En fuerza de ver esta separación intelectual de los sexos que la produce tan profunda en las familias, no se repara en ella, ni se notan sus malas consecuencias. No son mejores para la moral que la actividad de espíritu de la mujer no se emplee en cosas racionales y serias, y se vuelva toda á los caprichos de la moda y á los desenfrenos del lujo, con ruina de la fortuna de su marido y no pocas veces de su honor. De la falta de instrucción de la mujer, de la educación que se la da, de su posición social, falta contradictoria, anómala, resultan contrastes absurdos y daños grandes, todo en perjuicio de la moralidad y de las costumbres; y como las costumbres y la moralidad son la piedra angular de todo bien en un pueblo, urge disminuir el desnivel que existe entre los sexos.

Con riesgo de ser pesados hemos de repetirnos, porque nos importa mucho ser claros y no dar lugar á equívocos ni torcidas interpretaciones en algunos puntos esenciales. La igualdad no es en los sexos, ni en nada, la identidad; no queremos entre la mujer y el hombre la igualdad _absoluta_, sino la _suficiente_ para la armonía que hoy no existe, que no puede existir por desigualdades excesivas. No pretendemos que las mujeres sean militares, sino que no sean rechazadas de aquellas profesiones y oficios para que resulten aptas, y que no se declare su ineptitud sin que esté probada por la experiencia. No queremos lo que se entiende por la mujer _emancipada_, sino lo que debe entenderse por la mujer _independiente_; no queremos el _amor libre_, sino el matrimonio _contraído con libertad_, y en él, con las diferencias naturales y convenientes, las semejanzas necesarias para que sean la base firme de la virtud y prosperidad de los pueblos.

CAPÍTULO IV.

LA IGUALDAD ANTE LA LEY, ¿ES LA IGUALDAD ANTE LA JUSTICIA?

Hay en nuestra época una deplorable tendencia á convertir la aritmética en ciencia social, á tomar á los hombres como cantidades, y hacer con ellos operaciones de adición y de resta, lo cual no sólo conduce al error, sino que le consagra dándole un aire de verdad matemáticamente demostrada. Los partidarios más acérrimos de la igualdad sancionan á veces las más injustas desigualdades, porque, arrastrados del espíritu de siglo, sustituyen la aritmética á la lógica.

Igualdad ante la ley.--¿Qué significa esta frase? Que no hay ningún privilegiado; es decir, que legalmente no se puede evitar ningún castigo, alcanzar ninguna recompensa, ni obtener ventaja alguna en virtud del nacimiento ni de la posición social. Esta es la teoría.

Notaremos primero que no hay, como algunos dicen, cosas muy buenas en teoría y muy malas en la práctica, porque es un contrasentido sostener como bueno lo que es impracticable, ó lo que practicado hace mal. La ignorancia tiene maligna propensión á rebajar el valor de las fórmulas científicas y hacer á la verdad responsable de las consecuencias del error que se disfrazó con su nombre: así, pues, un mal en la práctica, supone un error en la teoría.

Sería necesario escribir un tratado completo de legislación para ver en qué se convierte prácticamente el principio de _igualdad ante la ley_. Esto no es posible, ni es preciso tampoco, porque, siendo nuestro objeto sentar principios generales, nos bastará tomar una ley, y demostrada en ella la causa del error, fácil nos será por analogía juzgar las leyes todas. Examinaremos la ley de reemplazo para el servicio militar.

No hace muchos años se eximían de este servicio los nobles; vienen los partidarios de la igualdad, y gritan: «¡Injusticia! ¡Cómo! ¡Porque esa mujer ha nacido duquesa podrá tener sus hijos á su lado, y porque la otra nació pobre se los arrancarán, á ella que le hacen más falta! ¡Se conviene en que las contribuciones deben pagarlas todas las clases, y esa que apenas el hábito puede hacer que se nombre sin horror, esa que se llama _contribución de sangre_, la pagará una clase sola! ¡Siendo principio de equidad reconocida que cada uno contribuya al sostenimiento de las cargas del Estado según los bienes que tiene que conservar en él, el que posee poco, el que tal vez no posee nada, ofrece su vida para conservar el orden y defender la patria, y lo que poseen los que están eximidos de defenderla! ¡Injusticia! ¡Iniquidad! ¡Abajo el privilegio! ¡Igualdad ante la ley!»

La igualdad se establece; todos nacen soldados, el duque y el proletario; la suerte decide luego el que debe tomar las armas. Mirad las listas: el Excmo. Sr. Duque de N., al lado de Pedro Fernández; esto ya es otra cosa; al fin las leyes empiezan á ser justas; ante ellas todos somos iguales. Del servicio militar puede uno eximirse por dinero; todos tienen derecho á comprar su licencia absoluta por 8.000 reales[2], lo mismo el Duque de N., que Pedro Fernández. ¿Lo _mismo_? ¡Pero si Pedro Fernández no tiene 8.000 reales, si no _puede_ tenerlos! ¡Si la ley lo sabe, y parte de este conocimiento, porque si todos _pudieran_ eximirse no habría ejército! Entonces, ¿qué se ha hecho de la igualdad ante la ley? ¿Qué se ha hecho? Ha quedado reducida á un cambio de nombre. La desigualdad de antes estaba escrita en un pergamino y se llamaba ejecutoria, y la de ahora está escrita en un papel y se llama billete de banco. Pues ¡valía la pena de verter tanta sangre y hacer tanto ruido para llegar á este resultado!

[2] Era el precio de la redención cuando esto se escribió.

Pero son muchos más los que logran eximirse por el nuevo método, y es ya una ventaja, y grande, porque los bienes se miden por el número de personas que pueden participar de ellos. Es verdad; el número de los que se eximen es mayor que era; pero la ley cuenta con esto, y llama á las armas 27.000 hombres, por ejemplo, en lugar de 25.000, contando con que 2.000 se redimirán; es decir, que el número de los privilegiados aumenta, y disminuye el de los que deben pagar la contribución de sangre; y no siendo menor el cupo, claro está que les ha de tocar á más. Es decir, que en nombre de la igualdad se hace que la más terrible de las desigualdades pese sobre el pueblo más que pesaba.

Supongamos que para establecer la igualdad verdaderamente decimos:--«No se admite más exención que la incapacidad física; el Duque de N. y Pedro Fernández serán soldados, sin poder presentar en su lugar billetes de banco, ni hombres comprados: ahora sí que se establece la igualdad verdadera, la verdadera justicia.»

Pedro Fernández se pone su uniforme de paño no más ordinario del que acostumbra á gastar; toma el fusil, cuyo peso no le agobia, porque está acostumbrado á trabajos materiales; duerme en una cama que no es peor que la suya; marcha sin esfuerzo á paso redoblado. El Duque no puede sufrir el roce de aquel paño tan basto; el peso del fusil le abruma, y es imposible que él duerma en aquella cama, ni que ande á pie tan aprisa, él que no tiene costumbre de andar sino en coche ó á caballo. Lo que Pedro hace sin esfuerzo, á él le causa una fatiga abrumadora; le costará la vida, porque en una marcha, un día de mucho frío ó de mucho calor, sucumbirá. Hé aquí otro caso en que en nombre de la igualdad se echan sobre dos clases pesos desiguales. ¿Cuál es el origen del mal? El mal está en el error de que al establecer la igualdad ante la ley se parte del principio de que los hombres son iguales y se hallan en las mismas circunstancias, y como esto no es verdad, la igualdad ante la ley es mentira.

¿Qué hacer? No es éste el lugar de indicarlo. Nuestro asunto tiene una especie de fuerza centrífuga que tiende á lanzarnos fuera; pero combatiremos esta tendencia encerrándonos en él. Creemos haber dicho bastante para probar que la igualdad ante la ley, como generalmente se entiende, y la igualdad ante la justicia, no son una misma cosa.

CAPÍTULO V.

DE LA EQUIVALENCIA.

Hemos indicado ya que la equivalencia ensancha el círculo de la igualdad social, y conviene recordarlo por lo que el hecho influye al presente y por la mayor importancia que tiene cada vez.

Según queda dicho, á la igualdad salvaje sucedieron las desigualdades bárbaras y semibárbaras, que en castas ó clases, fatalmente separadas, marcaban á cada hombre su camino y á cada masa su grado. Roto por el progreso el estrecho molde en que se encerraba la actividad humana, ésta halló nuevos caminos y multiplicó los medios de perfección moral é intelectual y de progreso material. La abnegación no se limitó al heroísmo en los combates, sino que desafió la muerte en la epidemia, en el apostolado, en la investigación de la verdad, y tuvieron mártires la filantropía, la fe y la ciencia. Con los modos de hacer bien y las

fatigas y peligros de realizarle, se multiplicaron los generosamente dispuestos á padecer esas fatigas y arrostrar esos peligros, que, variados en forma y modo, se confunden en la elevada unidad del amor al bien y abnegación sublime.

La inteligencia aumentó casi al infinito sus diferentes manifestaciones, cultivándose de distintos modos convergentes todos al centro de la verdad: para buscarla pueden separarse los hombres, mas desde el momento que la hallan se aproximan.

Si hubo infinitos modos de ser santo y de ser sabio, también de allegar bienes de fortuna, y la prosperidad material pudo venir por multitud de caminos que le abrían las artes, el comercio y la industria.

Multiplicáronse los casos en que personas que empleaban su actividad de distinto modo, eran tenidas por igualmente útiles y apreciables; y clasificados como de valer igual, por la equivalencia llegaron á la igualdad.

El número de estos casos es cada día mayor, y así conviene, siendo el único medio de dar á las fibras del organismo social una elasticidad que las impida romperse. Con la igualdad crecen las aspiraciones á igualarse, y si en proporción no aumentan los medios, los sacudimientos son inevitables, ó lo que es todavía peor, habrá odios y desalientos que, sin energía para hacer explosión, son corrosivos y atacan á las fuentes de vida material y moral de los pueblos.

A medida que aumenta el caudal de los conocimientos humanos, se ven las íntimas relaciones que tienen unos con otros, su enlace íntimo y los mutuos servicios que se prestan los que cultivan las ciencias al parecer menos afines. Lo propio acontece con el organismo social, y á medida que se conoce mejor, se comprende la importancia de todos sus órganos, la necesidad de armonizarlos, y el absurdo y la injusticia de excluir de la consideración y del aprecio los que no pueden excluirse de la realidad, porque es esencial para la vida. Desde el momento en que las sociedades se consideran como organismos, los individuos que las componen tienen que ir dejando de ser _partes de una masa_ para convertirse en _elementos de una armonía_: esta armonía sería imposible si no pudiera contribuir á ella más que la igualdad uniforme, simétrica, rígida, por decirlo así, que exige condiciones idénticas; pero es factible con la equivalencia que aprecia _méritos iguales en servicios distintos_.

Ciertamente que las preocupaciones se han opuesto y se oponen aún á admitir la equivalencia de ciertos servicios, que el trabajo material no se considera propio de una persona digna; pero á medida que el obrero mecánico necesita ser más inteligente, á medida que el trabajo de la inteligencia y de la mano se confunden, necesariamente ha de variar la consideración que inspira el trabajador. Los oficiales de marina se creerían rebajados siendo maquinistas; pero ya se irá reconociendo el absurdo y el perjuicio de que no lo sean: un capitán de barco mira con desdén al maquinista, que por de pronto tiene más sueldo que él, y no tardará en tener igual consideración, ó en ser uno mismo el que dirige la máquina y manda el barco, cuando se vaya comprendiendo mejor que las manchas que se lavan no envilecen, y que en todo _mandar_ debe ser _dirigir_.

Pero las preocupaciones dan lugar á hechos y tienen consecuencias que no varían sino con mucha lentitud, y no hay cosa más absurda ni peligrosa en la práctica social que calcular por lo que _debiera ser_, prescindiendo de lo _que es_. El hecho, el más injusto, el que nos parezca menos razonable, ha tenido _motivo_ de ser que se consideró como razón, y si no lo era, ó no lo es ya, si la causa se invalida, el efecto no se puede aniquilar instantáneamente. Reconocida la injusticia de las castas, proclamada la igualdad, ¿la ley que la establece podrá suprimir en el mismo día la soberbia de los de arriba, la abyección de los de abajo, los vicios del que manda sin freno y del que obedece sin condición? Cierto que las castas se deben suprimir; pero verdad también que es necesario precaverse contra la ilusión de que ningún hecho social se puede arrancar de raíz sin que deje germen ni consecuencias, y que la demostración lógica ó el mandato de la ley rectifican inmediatamente la voluntad, desvanecen el error, rompen el hábito y modifican el carácter. Las categorías sociales que por no ser legales no son menos positivas, necesitan también tiempo para variar, porque la opinión, su única legisladora, no puede modificarlas sino modificándose, lo cual no se verifica de una manera instantánea. La opinión va admitiendo equivalencias sociales, admite más cada vez; pero no hay que pedirle que inmediatamente las acepte todas, ni desesperar porque rechaza algunas. Hay que darle tiempo para que dilate la esfera de la dignidad, y también para que se hagan dignos los que debe dignificar. Del hecho de privar á una clase de consideración, suele resultar que llega un momento en que no la merece; si este estado se prolonga, deja huella, casi siempre profunda, y aunque no sea indeleble, tampoco fácil de borrar: si necesita un titánico esfuerzo para morir con honra el que ha nacido con nota de infamia, tampoco sin firme resolución y perseverancia se eleva moralmente mucho el que es tenido en poco; de modo que las consecuencias de una injusticia tienen apariencia de justificarla, y positivamente la fortifican para con muchos que miran la humillación de una clase rebajada como argumento á favor de los que la rebajaron.

Para que á la equivalencia de los servicios vaya correspondiendo la de los méritos, y la igualdad se extienda y cimiente en bases sólidas, no ha de calificarse de imposible lo hacedero, ni tener por fácil lo que no lo es; no debe llamarse derecho al hecho, ni

tampoco prescindir de él y, cerrando los ojos á sus consecuencias inevitables, gastar en negarlas la fuerza que debe emplearse en procurar que vayan desapareciendo. Para que una clase logre la misma consideración social que otra, no basta que tanto como ella sirva á la sociedad; es necesario que además se haga respetar por sus condiciones morales é intelectuales, sin lo cual jamás conseguirá que haya relación entre lo que sirve y lo que merece. ¿Por qué ciertas obras se califican de viles? Por el envilecimiento del obrero: haced á éste respetable, y la obra quedará ennoblecida.

Se clama contra la explotación de la debilidad por la fuerza; pero sería bien no rebelarse contra la naturaleza humana, comprender lo que es inevitable en ella, y ver que el problema no consiste en que los fuertes no abusen de los débiles, sino en que no haya débiles ó en que haya pocos. En una obra cualquiera, escalónense los que han de llevarla á cabo, desde el rico capitalista hasta el miserable bracero; dése al que es explotado por los de arriba la facultad de explotar al que está debajo, y se verá cómo aquella masa se convierte en explotadores y explotados de varias categorías, hasta que llega una que no tiene debajo á nadie, ni halla compensación á la dura ley que recibe, con la que impone. Esto sucede en todas partes y siempre; y si se analizan los elementos del fenómeno, si se pregunta por qué no hay relación exacta entre los servicios y las remuneraciones, ni posibilidad de establecer equivalencias sociales más equitativas, se verá que la inferioridad moral ó intelectual, ó las dos reunidas en el obrero explotado, son la causa de que se tase tan bajo la obra, y que no puede aumentar el número de equivalencias sociales sino en la medida que aumentan las analogías y semejanzas entre los que han de figurar á la misma altura.

Cualquiera dirección que tomen los amigos de la igualdad, siempre hallarán en su camino condiciones morales é intelectuales; y aunque comprendan y hagan valer todo el alcance de la equivalencia, verán que tampoco puede prescindir de lo que el hombre debe y conoce, y que ni los decretos, ni las leyes, ni los motines, ni las rebeliones lograrán que se tengan por _equivalentes_ los servicios que prestan personas muy _desiguales_.

CAPÍTULO VI.

QUE LOS HOMBRES NO HAN MENESTER OCUPAR EN LA SOCIEDAD POSICIONES IGUALES PARA SER IGUALMENTE DICHOSOS.

Suelen encomiarse las ventajas de la pobreza por los que no han sido pobres, de la medianía por los que aspiraban á salir de ella, y de la moderación y templanza por los que tal vez tienen una ambición sin límites. Diríase que hay circunstancias en que no se predica la resignación sino para ponerla á prueba, ni la virtud sino para explotarla. Mas aunque esto acontezca alguna vez ó muchas, no deja de ser cierto que la dicha no está sujeta como esclava á los caprichos de la fortuna.

Parécenos que deben huirse dos extremos: ni tomar como historia el cuento de que para hallar un hombre feliz fué necesario buscarle entre los que no tenían camisa, ni creer que se necesitan ricas galas para ser dichoso y que lo es todo el que las tiene.

La miseria es desdichada, hay que reconocerlo, siquiera no sea más que para no insultarla con plácemes hipócritas ó ignorantes.

El que tiene hambre ó frío, el que carece de albergue racional, de cama, del preciso descanso después de un trabajo rudo, aunque se ría, aunque esté alegre alguna vez, es desdichado; se le observa en un momento de expansión, y se le envidia; en una hora de insensatez, y se le desprecia; pero tomando su vida entera, tal como es, sustituyendo á la apariencia la realidad, á nadie que razone y sienta bien deja de inspirar lástima.

Ninguna persona de entendimiento y de corazón puede prescindir de la miseria, ya la sienta como una desdicha compadecida, ya la contemple como un espectro amenazador; mas por terrible que parezca ó simpática que sea, no debe considerarse cual regla, sino cual excepción, que será más rara á medida que los hombres sean más racionales y mejores. Cuando la miseria toma grandes proporciones; cuando se extiende á masas y persiste en afligirlas; cuando, en vez de ser una desgracia individual y pasajera, es un fenómeno social permanente, puede asegurarse que la sociedad está mal organizada, que los hombres no comprenden su conveniencia y su deber ó le pisan, que á sus relaciones no preside la justicia. Así acontece muchas veces, porque los pueblos emplean sus esfuerzos y sus tesoros no en disminuir su miseria moral y material, sino en aumentarla; de modo que, siendo tan grande, parece como inevitable. Pero no es la magnitud de un mal, sino su índole, la que hay que tener en cuenta para declararle sin remedio; y como al estudiar la miseria permanente y en grandes proporciones se ve que es consecuencia de errores é injusticias á que puede y debe oponerse la justicia y la verdad, y como la verdad y justicia solamente son eternas, necesarias y propias para servir de regla, todo lo que á ellas es contrario debe considerarse como contingente y combatirse como dañoso y perecedero.

El hecho de la miseria, que en algunos países es una excepción, debe serlo en todos, y al estudiar esta dolorosa desigualdad, debemos considerarla, no como una parte del organismo social, sino como una dolencia que sólo por culpa del hombre tiene carácter contagioso y se hace crónica.

La miseria, la _falta de lo necesario fisiológico_, lo repetimos, es una positiva y gran desgracia, y el que la padece no puede hallar equivalencias, ni compensaciones que le igualen para la felicidad, con el que posee lo indispensable: esta es la regla, que no invalidan ciertas excepciones. Porque haya un miserable alegre y un opulento que se desespere y se suicide; porque ciertas individuales condiciones se sobrepongan á todas las circunstancias exteriores, no hay que negar á éstas la influencia que por lo común tienen.

Pero desde el momento en que el hombre no puede con razón llamarse miserable; desde que tiene trabajando lo necesario para vivir; desde que no es más que _pobre_, puede ser dichoso, tan dichoso, más acaso que los que le aventajan en bienes de fortuna. No faltan pruebas de esta verdad; pero suele faltar quien las aprecie en su verdadero valor, quien prescinda de apariencias, quien se despoje de vanidades y envidias que tienen la pretensión de definir la felicidad que dificultan. Es deplorable, porque el conocimiento de la felicidad verdadera contribuiría á lograrla, como aleja de ella el desconocer los esenciales elementos de que se compone. Hay aspiraciones que sólo tienen un limitado número de individuos, pero á ser feliz todo el mundo aspira: el sabio y el ignorante, el noble y el plebeyo, el vano y el humilde, el rico y el pobre, el bueno y hasta el malvado. Ya se comprende la importancia de que todos estudien lo que á todos interesa, lo que todos buscan, lo que todos se afanan por encontrar y lo que muy pocos conocen. ¿Por qué quieren los hombres ser iguales á los que están más arriba en riqueza, en poder, en consideración? Por ser igualmente dichosos: éste es el fin; lo demás son medios, no siempre legítimos ni adecuados, para conseguirle, muchas veces propios para alejarlos de él. Multitudes de hombres que van con infinita fatiga haciéndose daño á sí propios y á los demás, no son muchas veces sino criaturas que buscan la felicidad donde no está ó por caminos que no conducen á ella.

Hay una propensión muy marcada á tomar por base de la felicidad la que sirve de regla para establecer la contribución: _la renta_. ¿Un hombre tiene doce mil duros? Es dichoso. ¿Doce mil reales? La vida es para él llevadera. ¿Dos mil? Es desgraciado. Esta opinión no se funda en ningún razonamiento; pero es frecuente que las opiniones más resueltas sean las menos razonadas. El error de que la dicha está en razón directa de la riqueza, es de los más perturbadores y dañinos; da la sed de goces materiales, la fiebre del oro y la idea de buscar un fin por medios que le hacen imposible.

Los bienes espirituales se multiplican á medida que son más los que de ellos disfrutan; la ciencia aumenta con el número de los que la poseen, y la virtud con los virtuosos. La verdad, la justicia y la belleza abundan á medida que es mayor la multitud de los que de ellas gozan; pero con los bienes materiales no sucede lo mismo, tienen una limitación propia de su naturaleza inferior y terrenal. Ved aquel público numeroso que escucha la defensa del inocente ó la acusación del culpable, los acentos sublimes de la música ó la voz augusta de la verdad. Hay allí personas de todas clases; unas van en coche, otras á pie y mal calzadas, quién sale de un palacio levantándose hastiado de la opípara mesa, quién deja su tugurio y hace un sacrificio de tiempo ó de dinero, de las dos cosas tal vez, para formar parte de la concurrencia. ¡Cuánta desigualdad material en aquellos hombres! Pero el abogado habla, el músico hace oir las armonías de su instrumento, el pensador revela los misterios de la ciencia, y las desigualdades de la fortuna desaparecen, y cada uno goza del arte, siente la justicia y aprende la verdad según las facultades de su corazón y de su inteligencia, desapareciendo las diferencias de la posición social y estableciéndose otras que nada tienen que ver con ella. Siempre que el hombre se eleva de las cosas materiales á las del espíritu, brinda á los demás hombres con la participación igual y completa de los bienes que posee; siempre que se rebaja á no preciar más goces que los materiales, tiende á excluir de ellos á los otros y á establecer desigualdades. El coche del que le tiene es suyo, y porque es suyo no puede ser de otro; la belleza de un cuadro es de los que le contemplan, de todos á la vez, sin que la parte que toma cada uno merme la de los demás, y antes por el contrario aumentándola.

No hay que insistir en verdades tan sencillas y claras; pero conviene sacar algunas de sus principales consecuencias más íntimamente relacionadas con el asunto que nos ocupa. La igualdad en la dicha la quieren todos los hombres; el hacer consistir la dicha en los bienes materiales es una propensión muy generalizada; los bienes materiales, cuya posesión excluye á otro posesor, tienen una tendencia exclusiva y antiniveladora; de manera que al absurdo de suponer que la felicidad guarda proporción con la riqueza, se une el de imaginar que ésta puede ser el patrimonio de todo el mundo.

Para que los hombres sean igualmente dichosos es necesario establecer entre ellos niveles de inteligencia, de bondad, de virtud, no de renta, ó de producto del trabajo, que siendo suficiente para cubrir las verdaderas necesidades, lo es también para procurar la verdadera dicha.

¿Quién ha formado la estadística de los dolores y de los goces humanos? ¿Quién puede formarla? Este hombre está desnudo, descalzo, hambriento; es un mal evidente para la multitud que al pasar le compadece; aquel otro tiene amor, odio, ambición, envidia, remordimientos, sed de venganza, de poder, de fama ó de oro: su alma se agita en terrible lucha, su corazón destila hiel y rebosa amargura; son males que la muchedumbre no percibe, y si va á pie no repara en él, y si va en coche le envidia. Los inconvenientes de la pobreza son ostensibles; pero se repara poco en los infinitos medios que emplea la criminal codicia para dañar al rico: disfrazada de amor, engaña á sus hijos y se los arranca; adula sus pasiones, y le extravía sus debilidades y le pone en ridículo; acecha sus extravagancias, y le hace declarar loco; acibara sus últimos momentos para arrancar un legado, y ríe sobre su tumba, si acaso no la abre prematuramente. Mas los peligros exteriores de la _riqueza_ son los menos terribles; la gran dificultad para que sea dichoso el que posée superabundantemente medios de fortuna consiste en que necesita proporción entre ellos y los morales, y que á la superioridad económica corresponda la superioridad moral.

El problema de la vida del pobre es relativamente sencillo: sus deberes son, por regla general, negativos; sus extravíos están en gran parte limitados por la necesidad de un trabajo constante y la falta de medios pecuniarios. De la posición humilde viene la templanza en los deseos, esa clave de la felicidad que el pobre recibe casi gratis, que el rico logra tan difícilmente. El que no está sujeto por las necesidades materiales y verdaderas de la existencia, tiene que imponer silencio á las ficticias del egoísmo y que encadenar el desenfreno de todas las pasiones. Si se entiende por pasión lo que á nuestro parecer debe entenderse, _todo deseo vehemente contra razón ó justicia que persiste y mortifica_, se comprenderá cuán grande puede llegar á ser la esfera de las pasiones y cómo se dilata á medida que el hombre se eleva en la escala social. Hay pasiones detonantes, por decirlo así, que todo el mundo conoce, porque hacen ruido al hacer explosión; pero hay otras, las más, que pasan desapercibidas, clavando en silencio su aguijón ó destilando su virus corrosivo. La pasión, que es sinónimo de sufrimiento, tiene muchos caminos para llegar al rico y muy pocos para llegar al pobre, que por lo común cifra su ventura en tener cubiertas sus necesidades materiales; el poder satisfacerlas, ni aun le ocurre al rico que sea un bien, y teniéndole se cree y es desgraciado, y sufre y se desespera.

Otro grande enemigo de la felicidad del rico es el amor propio, monstruo voraz nunca satisfecho que pide más cuanto más le damos. Él amuebla la casa, atavía á la persona, dispone la comida, señala el número de servidores y determina la clase de trabajo, el modo de viajar, de divertirse, y, en fin, lo dispone todo. El gusto, la conveniencia, la razón, muchas veces el sosiego, la vida y hasta la honra, se sacrifican á sus exigencias sin límites. Como líquido incoloro, toma el color del vaso que le contiene, y con flexibilidad infinita se acomoda á todas las formas del cuerpo que enlaza; se adapta á las puerilidades de la vanidad y á las soberbias del orgullo; codicia un dije, un traje, un mueble, el poder, la fama, y según con quien habla, va diciendo:--Viste con elegancia, ten casa lujosa, anda en coche, sé literato notable, poeta aplaudido, músico ó pintor laureado, hombre de ciencia insigne, general, banquero, diputado, senador, ministro ó secretario de ayuntamiento.

¡Qué vértigos de cólera, ó qué angustias de pena, cuando otro alcanza el puesto que se ambicionaba, ó recibe los aplausos que se clavan como espinas en el corazón del que los quería para sí! ¡Qué facilidad para crear aspiraciones, qué dificultad para satisfacerlas! ¡Qué desdicha sacar las condiciones de bienestar fuera de sí mismo y cifrarle en lo que piensan ó sienten ó dicen los otros!

El amor propio necesita espectadores; los busca como instrumentos de satisfacción y los halla convertidos en tiranos, cuyos mandatos obedece en cambio de un aplauso que mendiga y no siempre logra. Esa dependencia de los demás; esa verdadera esclavitud de los que prefieren inspirar envidia á merecer respeto; ese someterse incondicionalmente al _qué dirán_ de los que tal vez no saben lo que dicen; ese espíritu que vive de prestado y en la mayor de las miserias, puesto que no tiene satisfacción legítima que pueda llamar suya, todo es consecuencia del amor propio excitado y fuera de sus razonables límites. Se dirá que no los traspasa en todos los ricos, ni deja de extralimitarse en algunos pobres; no negaremos que suceda así; pero es igualmente cierto que, por regla general, donde la vanidad impera, donde el amor propio tortura, donde las pasiones hacen verdaderos estragos, es en los ricos, no en los pobres. Estos, sin saberla, siguen la sabia máxima de

Iguala con la vida el pensamiento,

y no van de continuo con sus aspiraciones donde sus medios no pueden llegar, ni dan cuerpo, convirtiéndolos en desgracias, á los devaneos de la imaginación.

La fortuna, como una madre inconsiderada, suele hacer infelices á los hijos que mima. Halagados por ella, son tan débiles, tan susceptibles, tan impresionables, que la menor contrariedad los irrita, el más pequeño contratiempo los desespera; ellos son los que se crean esas situaciones envidiadas que les parecen insoportables; ellos los que, teniendo tantos caminos que elegir, no van

por ninguno y llaman abismo á una depresión cualquiera. El hombre necesita luchar, es de ley que luche; y combate por combate, no siempre es el más rudo el que tiene que sostener el pobre, sujeto constantemente á pruebas que no sufre el rico, que en cambio pasa por otras que aquél ignora.

La estadística de la felicidad no puede hacerse, sea que no exista sino por excepción rara, sea que se oculte ó que se halle donde no la buscan los que pretenden estudiarla; pero el contento es más general y más visible, y ciertamente no se observa que esté en proporción de la renta. Donde quiera que se reunen muchas personas de varias clases, en viajes, paseos, diversiones públicas, no se ve que la alegría se mida por el precio de las localidades, y antes puede afirmarse que los que se divierten más son los que pagan menos. Las personas que parecen hastiadas, que vuelven en el teatro la espalda al escenario y se aburren viajando en coches de primera ó en salones, no son los menos favorecidos de la fortuna.

Se dirá, y es cierto, que la alegría no es la felicidad; pero si el estudio de ésta presenta dificultades insuperables, ofrece menos el comparativo de la desgracia, sobre todo si la observamos donde aparece en relieve, en la desesperación suprema que conduce á la muerte voluntaria. Que un suicida supone muchos desesperados y un desesperado muchos infelices; que siendo la clase pobre más numerosa da el menor número de suicidas, cosas son ciertas, sabidas, y lógica es la consecuencia de que no debe ser más general la felicidad entre aquellos en que es más frecuente la desesperación.

Cada edad, cada estado, cada situación, cada clase tiene sus ventajas y sus inconvenientes, sus disgustos y sus satisfacciones, sus penas y sus consuelos; nada más perjudicial ni menos conforme á la verdad que cortar por un mismo patrón la dicha de criaturas diferentes, y pretender que no pueden llegar á ella sino por un camino y pagando á la entrada una cantidad fija y crecida.

El joven con las ideas y sentimientos de su edad no comprende que el viejo deje de ser desgraciado; pasan los años y es feliz de un modo que le parecía imposible. El guerrero no puede imaginar la dicha de la mujer piadosa que cura las heridas que él hace, y cuya vida es más envidiable que la suya; los que distan mucho en ocupaciones, medios é ideas, no comprenden que pueda haber ventura tan diferente de la que ellos tienen ó desean. Pero no dejándose dominar por las propias impresiones ni extraviar por apariencias, y observando las diferentes clases sociales en sus dolores y en sus alegrías, se ve que son igualmente dichosos los que ocupan posiciones más desiguales y que hay compensaciones providenciales que los hombres desconocen con frecuencia por su culpa y para su desdicha. La Providencia, que ha dado á cada sér una organización apropiada al medio en que ha de vivir, al colocar al hombre en una sociedad en que hay necesariamente desigualdades, no sujetó á ellas nada verdaderamente importante, nada esencial. En la virtud y en la dicha, en la salud del cuerpo y en la del alma entran elementos que no dependen de la fortuna, cuyos caprichos no afectan más que á las superficies de la existencia y á los hombres superficiales. El dolor y la dicha tienen misterios que ningún hombre, ninguno, puede penetrar; desigualdades terriblemente enigmáticas, pero no proporcionales á las de la posición social, ni dependientes de ella.

Bien sería que nos convenciéramos de que hay inconvenientes y ventajas propias de cada situación, compensaciones que existen, aunque no sean ostensibles, diferencias exteriores que no alteran la igualdad íntima, y que el que nace príncipe no tiene más probabilidades de ser dichoso que el que nació pastor. El convencimiento de esta verdad calmaría la fiebre de poder y de riqueza que hace delirar á generaciones extraviadas; aniquilaría un poderoso instigador de iras populares; pondría de manifiesto que, salvo algunas criaturas excepcionales, que son el secreto de Dios, salvo los casos de miseria, obra impía del hombre, la posible felicidad sobre la tierra, como el sol, brilla para todos.

CAPÍTULO VII.

LA PROPIEDAD Y LA IGUALDAD[3].

[3] Hemos utilizado para este capítulo la excelente obra del Sr. D. Gumersindo de Azcárate, _Ensayo sobre la historia del derecho de propiedad_.

En toda discusión, para que sea posible, hay algún punto esencial en que convienen los que discuten, y damos por supuesto, al escribir este capítulo, que el lector piensa, como nosotros, que no puede haber sociedad sin propiedad constituída en tal ó cual forma, condicionada de ésta ó de la otra manera, pero propiedad en fin.

Si el hombre es propietario, como es sociable, por ley de su naturaleza, tal vez no sea inútil investigar, aunque fuese brevemente, de qué manera influye la propiedad en la igualdad, puesto que esta influencia ni puede ser nula ni es evitable.

Porque los niveladores sociales atacan la propiedad con más ó menos violencia, con más ó menos lógica, pero la atacan siempre. ¿Están todos ciegos, furiosos ó de mala fe? ¿Cómo á muchos siglos de distancia, y con grandes diferencias en el clima, la religión, la cultura, el estado social, se repiten los mismos ataques, á veces en idéntica forma y en ocasiones con las mismas palabras? La permanencia del efecto revela la de la causa, y su poder, cuando persiste en medio de tantas cosas como desaparecen, y sobrenada en las tempestades de guerras, trastornos y revoluciones.

Han acusado, acusan y acusarán á la propiedad de establecer grandes diferencias entre los hombres, y aunque el cargo pueda ser exagerado ó injusto, según las circunstancias, el hecho es cierto: entre la propiedad, tal como está constituída siempre que por los niveladores es atacada, y la igualdad, hay antagonismo que no se debe disimular, sino analizar. Recordemos que la igualdad no puede tener derecho contra el derecho; recordemos que no le es dado cambiar las leyes de la Naturaleza y de las sociedades humanas; recordemos, por último, que el fin primero del hombre no es ser igual á otro, sino ser justo, perfeccionarse: teniendo presentes estas premisas, y sacando de ellas sus lógicas consecuencias, llegaremos á conclusiones que, tristes ó consoladoras, si son ciertas, hay que aceptarlas y someternos á la verdad, que á nadie se somete.

Tratando de su influencia sobre la igualdad, conviene distinguir la propiedad colectiva de la individual. La propiedad colectiva (que, entiéndase bien, no es el comunismo), igualando á los propietarios, iguala, hasta cierto punto, á los hombres que forman el grupo poseedor en común. Decimos _hasta cierto punto_ porque aun en los pueblos en que la propiedad era colectiva ha existido siempre más ó menos propiedad individual, influída por las diferencias de los individuos, y á su vez influyente en su desigualdad social. Aunque la tierra no fuese de nadie, los frutos repartidos para ser utilizados tenían que ser apropiados; aunque los bosques pertenecieran á todos, la caza era del que la mataba, y del que le pescaba el pescado, por más que los ríos y los mares no constituyen propiedad de ninguno. La colectiva evita sin duda la grande acumulación de fortunas, pero no las nivela tan completamente como se ha supuesto por algunos. El individuo, aun en los pueblos primitivos, ha sido dueño exclusivo de alguna cosa, ha tenido ventajas físicas, intelectuales y cualidades morales que le han hecho más rico que otro con menos recursos y moralidad: esto respecto á los copropietarios de un grupo en que la tierra se posee en común, que entre los grupos unos respecto de otros había mayores diferencias. La prioridad en apropiarse un terreno más fértil; bosques más abundantes de caza, ó ríos de pesca; la victoria en los combates; más servicios hechos al jefe del pequeño ó grande Estado, ó su mayor largueza; ventajas físicas, intelectuales ó morales, alguna ó varias de estas circunstancias combinadas hacían que las colectividades propietarias fuesen unas ricas y otras pobres. Aun en nuestros días vemos pueblos con propios de gran valor, otros que nada poseen, y al lado del concejo en cuyos montes se pudre la leña, el que no tiene qué quemar.

La propiedad, aun la colectiva, no es niveladora, sino que, por el contrario, propende á establecer la desigualdad entre los propietarios; y si todas las mañanas se hiciera un reparto que los igualara, todas las noches los habría más ricos y más pobres.

La propiedad colectiva ni se presenta de una manera invariablemente uniforme, ni deja de comprender sus desventajas, ni pasa á ser individual sin términos medios y variaciones. Ya todo es común, cultivo y aprovechamiento; ya se señala á cada individuo el trabajo de cierta porción de tierra; ya se distribuye ésta por cierto tiempo y por lotes que vuelven al fondo común para ser adjudicados de nuevo alternativamente á sus temporales poseedores. Más adelante, las tierras, una gran parte al menos, pasan á ser propiedad de las familias, pero han de permanecer en ellas; no han de poder enajenarlas, ni donarlas, ni legarlas, y cuando esto se consiente es con ciertas condiciones. El legislador se precave contra la desigualdad, que ve, que palpa, que teme; pone límites á la extensión de las posesiones; permite que, incultas, se las apropie el que las cultive; dispone que, periódicamente, se restablezca la igualdad, restableciendo la primitiva distribución que se había hecho por partes iguales, y según tiempos y lugares, toma diferentes medidas encaminadas á evitar la acumulación de la riqueza. La lucha es larga, entre la igualdad, que pretende poner trabas á la propiedad, y ésta, que intenta romperlas todas; entre el espíritu de la propiedad colectiva y el de la individual; entre el Estado, que pasa fácilmente de la tutela á la opresión, y el individuo, que tiende á convertir la libertad en licencia. ¿Esta lucha ha terminado? Algunos pretenden que sí, y que logra completa victoria la propiedad individual, única compatible con los derechos del individuo y los progresos de la civilización, aunque poco favorable á la igualdad.

Aunque el individuo haya poseído siempre alguna cosa exclusivamente suya, y aunque las colectividades fuesen unas más ricas que otras, lo cierto es que la propiedad territorial en común, ó la posesión transitoria, eran favorables á la nivelación de las fortunas. Pero, ya lo hemos dicho, por querida que sea para los hombres la igualdad, no puede ser el único objeto de su existencia, ni pueden ellos sacrificarle todos los otros. A ser iguales en la miseria, prefieren salir de ella algunos, ó muchos; y como para esto hay que desplegar una grande energía _personal_, el fruto de ella tiende irremisiblemente á convertirse en propiedad _individual_. Así como la caza fué siempre del cazador, y del pescador la pesca, donde quiera que el hombre llevó mucha destreza, mucha inteligencia, mucha fatiga ó peligro para realizar una obra, quiso tener en ella una parte _suya_ proporcional al

trabajo que había empleado. En un pueblo primitivo, esta parte constituye riqueza que se consume, no que se acumula, y la desigualdad pasajera no era grande; pero, como hemos visto más arriba, á medida que un pueblo se civiliza, pueden manifestarse y utilizarse las diferentes aptitudes, y los que física, intelectual ó moralmente valen más, allegan recursos, realizan economías, son más ricos. Aunque la tierra continuase propiedad común, ó igualmente repartida é inmovilizada, diferentes industrias ofrecían cada vez más vasto campo á la energía inteligente del individuo y eran origen de propiedad individual. La agricultura ¿podía permanecer mucho tiempo petrificada en medio de elementos de vida más poderosos cada vez? Los brazos vigorosos ni las inteligencias activas ¿irían á cultivar la tierra común que perezosamente removían los débiles, los holgazanes ó los incapaces, para compartir por igual con ellos el fruto de tan diferente trabajo? ¿No quedaría el cultivo de la tierra encomendado á las manos más torpes y endebles y á las inteligencias más obtusas, incapaces de fecundarla? _A priori_ se comprende, la experiencia lo demuestra, y la historia presenta la propiedad colectiva en los pueblos primitivos, haciéndose individual á medida que se civilizan. De que el hecho es constante no cabe duda, y que es inevitable también parece claro.

Tenemos pues:

Que el hombre es sociable;

Que no hay sociedad sin propiedad;

Que la propiedad colectiva en un principio, se hace individual cuando adelanta la civilización;

Que la propiedad individual no es favorable á la igualdad.

¿Significa esto que por una pendiente inevitable, fatal, á medida que un pueblo se civiliza aumenta en él la desigualdad de las fortunas, de manera que los ricos son más opulentos y los pobres más miserables? Debemos confesar que á eso tienden muchos elementos de la civilización; pero hay otros que combaten esta tendencia, y el problema consiste, no en negar aquella parte de mal que entre sus bienes produce el progreso, sino en reconocerla; en ver hasta qué punto es inevitable, y hasta dónde puede evitarse y por qué medios.

Así como al empezar este capítulo dábamos por supuesto que el lector consideraría la propiedad como necesaria, para continuarle suponemos que reconoce el grave daño de la gran acumulación de riquezas al lado de la miseria suma.

La propiedad no puede volver á ser colectiva, ni inmovilizarse, ni mutilarse, ni tener límites en cuanto á su extensión: su libertad ha de ser respetada como la del propietario, pero cuidando de que no se convierta en licencia, porque comprenderla como el derecho de usar y de abusar de la cosa poseída, más es comprometerla que consolidarla: no ha de ser ni una víctima ni un ídolo; que no se salte ningún cercado, pero que en todos haya una puerta por donde entren la ley y la justicia.

La propiedad influyente é influída, emancipando unas veces al propietario y otras participando de su servidumbre, tiene con la igualdad relaciones tan estrechas, que como ella, establece entre los hombres primitivos pocas diferencias, que van creciendo con la civilización, hasta que llegan á un punto en que la riqueza se acumula, tiene movimientos vertiginosos ó inmovilidad pétrea, cae en manos rapaces ó muertas, y entonces viene el malestar, las convulsiones, y si el estado de la propiedad no cambia, los pueblos van á la decadencia ó á la ruina.

Todos los países en que se proclama el progreso, y que progresan verdaderamente, han modificado la propiedad en sentido favorable á la igualdad; pero sería un error suponer que la obra está concluída y la lucha terminada.

Los igualitarios individualistas sostienen que la libertad basta para establecer la armonía entre los propietarios, y que la propiedad individual más absoluta es la única posible y el mejor auxiliar de la igualdad: los niveladores conservan una hostilidad especial contra la propiedad inmueble, y pretenden volver á la propiedad colectiva; y todos suelen prescindir bastante del elemento moral como si la riqueza se distribuyera como giran los astros, en virtud de leyes físicas.

Si el hombre fuera perfecto, sería justo nada más que con ser libre; pero su imperfección hace indispensable coartar su libertad en sus relaciones con los otros, lo mismo como propietario que en cualquier otro concepto. La libertad es un medio, no un objeto; es parte integrante del sér racional, no todo; es un medio de llegar á la armonía, no la armonía misma; es un elemento que no ha de sacrificarse á otro, pero que no puede exigir que se le inmole ninguno. Proclamad al propietario libre de hacer cuanto quiera de su propiedad, y la sustraerá al pago de los tributos; opondrá con ella un insuperable obstáculo á las obras públicas; sacrificará á los operarios con que la beneficia, por la falta de higiene ó mezquindad de retribución; depositará materias inflamables, sin precaución alguna, en el centro de las ciudades; llevará el desenfreno del monopolio adonde no pueda seguirle la concurrencia; alquilará

casas inhabitables, coches donde peligra la vida de los viajeros; venderá vino envenenado, trigo averiado, pescado podrido, etc., etc. Todo esto y mucho más hará la propiedad si se la deja hacer lo que quiere, y tanto como otra cosa, y más que muchas, necesita estar sujeta á reglas: que sean justas es lo que debe procurarse, porque pretender que no las necesita es desconocer la naturaleza del propietario, es decir, del hombre.

Estas reglas no pueden ser fijas; lo que era imposible ayer, es hacedero hoy y será insuficiente mañana: la cuestión es siempre comprender bien la justicia y aplicarla á la propiedad como á las demás cosas. Si no hay derecho á pasar un nivel sobre los propietarios, despojando á los de arriba por favorecer á los de abajo, tampoco á repartir los tributos de modo que pesen más sobre los que poseen menos, ni á favorecer la acumulación con loterías, rifas y herencias que ni estrechan los lazos de familia, antes á veces los aflojan, ni son ley de la Naturaleza ni voluntad del testador. Sin salirse de las vías de la justicia pueden tomarse muchas medidas para disminuir el poder absorbente de la riqueza, que tiende á crecer, como la miseria, en rápida progresión: fijándose bien en los males que consigo lleva la excesiva desigualdad de fortunas, justo debe parecer disminuirla por medios equitativos que no chocasen con los respetables sentimientos de familia ni lastimaran los legítimos intereses.

Si es un anacronismo irrealizable convertir, en nombre de la igualdad, al Estado en posesor único; si los que tal pretenden son verdaderos retrógrados, tampoco podemos considerar como progreso el privar al campesino del prado y del monte común, de modo que no pueda tener ya vaca, oveja ni cerdo, y robe leña para cocer los alimentos y no morirse de frío. ¿Qué medidas se toman contra los ataques á la propiedad hechos en virtud de necesidades imperiosas y ocasiones continuas? ¿Dejarlos impunes? Está mal. ¿Penarlos? No está bien; y en este caso, y en otros muchos, resulta acrecentamiento de miseria y conflictos para la conciencia y el orden, de lo que para muchos es el ideal en materia de propiedad, á saber: que toda sea individual, sin que parte alguna quede en común. No vayamos á buscar á los bosques de los celtas, los eslavos y los germanos oráculos para la constitución de la propiedad; pero no creamos tampoco que el Derecho romano es la Buena nueva, y que basta anunciarla para regenerar económicamente á las naciones: el progreso no es predominio exclusivo de un elemento cualquiera; tomemos de cada civilización lo que tiene de humano, de general, de permanente, que es lo único justo, y arrostremos la desdeñosa calificación de _eclécticos_ más bien que merecer la de exclusivos ó insensatos.

Si los que combaten las exageraciones de la propiedad individual no exageraran á su vez, se habría adelantado más para la solución del problema, porque suponerle resuelto nos parece ilusión peligrosa.

Hay que deplorar los obstáculos que opone el egoísmo ciego y la inmoralidad y la ignorancia á que se aumente ni aun se conserve lo poseído en común: el prado no se limpia ni se abona, el monte se tala, el ferrocarril se administra mal, y cuando la comunidad no es bastante moral é inteligente para ser justa, se la combate con ventaja, se la expropia, y aun se la despoja en virtud de razones aparentes que explotan otros egoísmos y otras inmoralidades. Cuando lo que es de todos pretende utilizarlo cada uno, y no quiere cuidarlo nadie; cuando hay muchos dispuestos á atacarlo con persistencia, y nadie á defenderlo resueltamente; cuando los principales interesados en que se conserve, y hasta donde sea posible se aumente, son débiles por falta de inteligencia y no comprenden lo que les conviene ó no saben hacer valer su derecho, los bienes comunes que favorecían la igualdad se acumularán en pocas manos. Dadas estas circunstancias, el mal no podrá evitarse, pero que al menos no se convierta en ideal, felicitando á la sociedad porque tiene una desdicha más.

La lucha seguirá por mucho tiempo; esperemos que no será eterna entre los que, sabiéndolo ó sin saberlo, favorecen la acumulación de la propiedad, y los que pretenden que se distribuya más igualmente: pueden contribuir las leyes á este último resultado; pero sobre que las leyes son el reflejo de las ideas y de los sentimientos, no hay legislación, cualquiera que ella sea, capaz de impedir la excesiva acumulación de la propiedad en pueblos donde hay pocas virtudes y mucha ignorancia. Todas las huelgas resueltas arbitrariamente por poderes niveladores; todos los decretos socialistas, y todas las leyes agrarias, no impedirán que sea miserable el ignorante desmoralizado y que cerca de él no posea excesivas riquezas el inteligente que no repara en los medios de acumularlas. ¿De qué le sirvieron á Esparta corrompida las leyes de Licurgo, ni á Roma degradada las disposiciones igualitarias de sus emperadores? En los Códigos había disposiciones favorables á la igual distribución de la riqueza, en las plazas muchedumbres hambrientas y en los palacios magnates cuyo lujo y repugnante glotonería han pasado á la historia. Ahora, después y siempre acontecerá algo parecido, porque la naturaleza del hombre no cambia esencialmente; y cuando á los progresos materiales no siguen los morales é intelectuales generalizados, la civilización da grandes medios para acumular riquezas é impulsos irresistibles que lanzan á la miseria.

La igualdad no debe combatir á la propiedad que no traspasa los justos límites, ni puede evitar que los pase sino elevando el nivel moral é intelectual: la condición no es fácil de llenar, pero es aún más difícil sustituirla por ninguna otra.

CAPÍTULO VIII.

DE LA ASOCIACIÓN Y DE LA IGUALDAD.

Es común emplear indistintamente la palabra _Asociación_ y la de _Sociedad_ para expresar la reunión de personas que unen sus esfuerzos con un fin dado y bajo una regla que admiten. Así vemos que se dice Asociación de socorros mutuos, Asociación internacional, Sociedad de San Vicente de Paúl, Sociedad para la reforma de las prisiones, etc., etc. Conviene, sin embargo, fijarse en que es un modo de expresarse impropio, que la confusión de las palabras influye en la de las cosas, y que el socialismo debe en parte sus progresos á confundir la asociación con la sociedad: las esenciales diferencias que entre estas dos existen creemos que pueden reducirse á tres:

1.ª En la Sociedad se reunen los hombres para todos los fines de la vida; en la Asociación solamente para uno ó varios que al constituirla determinan.

2.ª En la Asociación se entra y se sale voluntariamente, siendo el asociado dueño de aceptar ó no sus condiciones y de separarse de ella cuando no considera su marcha conforme al objeto que se propone, ó éste ha dejado de parecerle útil ó justo: de la Sociedad formamos parte queriéndolo ó sin quererlo, y aunque se dirija mal ó se extravíe, no podemos separarnos de ella, ni aun dejar de contribuir en cierta medida á darle medios para que realice los fines que reprobamos. ¿Qué hará el que no esté conforme con la organización social de un país? ¿Irse á otro? De hecho es imposible que millones de hombres abandonen la patria, y en la nueva habría también cosas con que no estuvieran conformes y á las que tendrían que contribuir.

3.ª La Asociación puede arrojar de sí á los asociados que no cumplen las condiciones pactadas, ó por cualquier motivo se hacen indignos de pertenecer á ella; la sociedad tiene que conservar en su seno á los que se ajustan á sus reglas, y á los que faltan á ellas, á los que son un elemento de prosperidad, á los que son causa de ruina, á los que la honran, á los que la avergüenzan, á todos. Los mismos criminales que recluye no los arroja de sí, sino que les señala una manera especial de existencia correspondiente á su manera de proceder especial también, y sólo rechaza al corto número de los que suprime condenándolos á muerte.

Indicado este deslinde que nos pareció conveniente entre la Sociedad y la Asociación, veamos si esta última es siempre favorable á la igualdad.

No hay que tener una ciega confianza en la asociación, ni suponerle un poder infaliblemente curativo de ciertas llagas sociales; es un poderoso instrumento, no cabe duda, pero que hace bien ó mal según el modo de manejarle y el objeto conque se emplea: muchos ejemplos pueden citarse, por desgracia, pasados y presentes, de asociaciones que no se proponen un fin bueno, ó si lo es, pretenden llegar á él por malos medios, y al lado de los que reunen los esfuerzos de los débiles se ven los que combinan los medios de los poderosos para hacer su poder irresistible.

Así, pues, en la igualdad racional, en la igualdad que se realiza dentro de la justicia elevando á los de abajo, no rebajando á los de arriba, ¿qué influencia ejercen las asociaciones? Según sean. Toda asociación inmoral, ya por el objeto que se propone ó por los medios que emplea, es contraria á la igualdad aunque la proclame y en apariencia la favorezca.

Asociaciones hay que han alcanzado un buen fin por medios legítimos, y no obstante pueden calificarse de perjudiciales y contrarias á la igualdad por el abuso que de su gran poder han hecho: dada la miserable condición humana, fuerza que no se equilibra, fuerza perturbadora; y como no suele hallarse ordenada por la conciencia de los que la ejercen, necesita otra enfrente que la contenga en sus justos límites.

Cualquiera que sea el fin que se proponga y los medios que emplee, debe también reprobarse toda asociación que no vive á la luz del día y cautelosamente se oculta: hoy, en la casi totalidad de los pueblos cultos, no tienen razón de ser esos misterios, y asociación donde hay secreto envuelve en él inmoralidad, daño grande, y puede decirse que es antisocial. Con el secreto va la abdicación de la conciencia de los asociados, que reciben en las tinieblas impulso para moverse, más como máquinas que como personas; va como un depósito de materias explosivas que detona á voluntad del que la tiene, tal vez, torcida por algún fanatismo ciego ó interés vil. Dentro de la sociedad caben numerosas asociaciones; pero aquellas donde hay secreto más bien que órganos funcionando para contribuir á la salud, pueden considerarse como focos purulentos que comprometen la vida.

Tal vez podría ser un buen medio de juzgar una asociación observar las consecuencias de la igualdad entre sus miembros: si siendo iguales hay en ellos armonía permanente sin severa disciplina, puede asegurarse que se proponen un buen fin por buenos medios y no abusan de los que tienen. Las asociaciones entre buenos prosperan tanto más, cuanto ellos son más semejantes; en las que forman los perversos es fatal la igualdad, la codicia se disputa la ganancia ó la presa, la vanidad choca á impulsos de la envidia, y la ira sangrienta lanza á los crueles unos contra otros. Entre los que son igualmente malos no hay paz sino impuesta por el miedo de alguno que es peor, y entre los que sin serlo hacen daño asociados no hay igualdad tampoco, sino jerarquías omnipotentes y obediencias ciegas. Asociación sin secreto, en que hay armonía permanente siendo los asociados iguales y libres, conocedores y responsables de lo que hacen, puede decirse que es asociación beneficiosa para la sociedad en cuyo seno vive; si no tiene estas condiciones, hará daño, y mucho.

Difícil parece juzgar si hasta el presente la igualdad ha recibido más mal que bien de la asociación: duda es muy fundada, y problema histórico difícil de resolver; pero si con respecto á lo pasado el ánimo se queda perplejo, por lo que hace al presente parece claro que más veces es obstáculo que auxiliar de la igualdad la asociación. ¿Hay que renunciar á ella, que perseguirla, que matarla? No: no es renunciable, ni mortal, sino inevitable y fecundo instrumento de progreso y de vida, pero no inofensivo, y como esas grandes ruedas motoras, da poderoso impulso, pero ¡ay de aquel á quien engancha y voltea! Pone en comunicación instantánea los antípodas, perfora montañas, abre istmos, generaliza verdades, consuela penas; pero también las causa, también difunde el error, también paraliza muchos movimientos vitales con sus aceradas y acaso invisibles redes, también está impulsada á veces por el fanatismo y la codicia, también extravía á los que había de guiar y abruma á los que debiera sostener.

No hay más medio de combatir las asociaciones perjudiciales que oponerles las útiles; la influencia de la asociación no puede neutralizarse sino con la asociación; y para que muchas igualdades que se escriben no sean letra muerta; para que enfrente de colectividades poderosas el individuo no sucumba, es necesario que se una á otro y otros y muchos individuos, que se asocie en el derecho y por el derecho contra los que intentan atacarle. La asociación es una fuerza inmensa; ¿quién lo duda? Pero, como la locomotora, necesita carriles y maquinista, las vías de la justicia de donde no pueda apartarse, la mano de la inteligencia que regule sus movimientos; si no, se estrella ó atropella, y aunque es posible que proclame la igualdad, es seguro que no la sirve.

PARTE TERCERA.

De la igualdad considerada políticamente y en sus relaciones con la libertad.

CAPÍTULO PRIMERO.

DE LA IGUALDAD SOCIAL Y DE LA IGUALDAD POLÍTICA.

Hemos visto cómo el máximum de la igualdad existe en los pueblos salvajes; cómo á medida que los hombres se civilizan se van diferenciando más y más, y cómo llega un momento en que la desigualdad excede los justos límites, y si no se reacciona contra ella viene indefectiblemente la decadencia ó la ruina. En los pueblos civilizados y cristianos se verificó esta reacción[4]; las trabas, los privilegios, han desaparecido ó van desapareciendo; las clases no se inmovilizan ni se cierran; por la escala social pueden subir todos los que pongan en ella pie firme y mano robusta, y al que está arriba no se le arroja porque venga de muy abajo, ni aun se le pregunta de dónde salió. Al ver á tantos como se han elevado por su actividad, por su inteligencia, por su valor ó por su fortuna; cómo van desapareciendo de las leyes y de las costumbres barreras insuperables; cómo tiene coche el que anduvo con los pies descalzos, y es diputado, ministro, duque, el hijo de un artesano, los amigos de la igualdad tal vez la saluden alegres suponiendo que su reino llega y que impera sin excepción y sin obstáculo.

[4] En Rusia se está verificando.

La conclusión carecería de exactitud; se marcha hacia la igualdad, es cierto; pero, lejos de haber llegado á ella, estamos en un momento histórico en que las diferencias han llegado á un límite que no alcanzaron nunca, y de poco sirve que por escrito se nieguen ó se borren de los códigos si están en los hechos y viven en las entrañas de la sociedad. ¿Cuándo tuvo el magnate refinamientos de lujo, comodidades sibaríticas que contrastasen con la miseria tanto como hoy? ¿Cuando la virtud triunfó de tantos halagos y tentaciones, ni la maldad empleó medios tan eficaces y horrendos para hacer daño? ¿Cuándo la dignidad y la belleza brilló como entre esas masas abyectas y deformes que la concurrencia, la división de trabajo, el alcohol y la prostitución desfigura y degrada? ¿Cuándo estuvieron tan lejos las eminencias del saber y los que nada saben? Nunca: hay que verlo claro y decirlo resueltamente: el mal, si no es irremediable, es positivo, grave, y no pequeño el error y el peligro de predicar la igualdad

política y tratar de realizarla prescindiendo de diferencias tan radicales. Vivimos en una sociedad que lleva en su seno desigualdades de tal magnitud y extensión, que no pueden armonizarse con doctrinas, escuelas, partidos y leyes que establecen la igualdad, y han de resultar decepciones, choques y conflictos continuos de la contradicción entre las ideas, los códigos y los hechos.

Es cierto que hoy (en muchos países, al menos) ningún privilegio vincula la riqueza en una clase; ninguna ley escrita se opone á que todos lleguen al poder y á la fortuna; pero ¿no hay mucho de ilusorio y de mentido en estas facilidades? Si la gleba tuvo siervos, también la industria los tiene, y el niño que trabaja antes de tener fuerzas, que tiene vicios antes de tener pasiones, que vive en una atmósfera infecta física y moralmente, en su ignorancia y en su degradación, lleva la ley de raza que le condena á una condición servil. Y de estas criaturas hay miles y millones en fábricas, en minas, en talleres, ó viviendo en los campos entre los animales y poco menos embrutecidos que ellos, ó de mendicidad por los caminos, ó de no se sabe qué por calles y plazas. ¿Acaso pueden los códigos ni las constituciones nivelar semejantes abismos sociales, ni subir á grande altura á los que han nacido en ellos? ¿Qué es la libertad en que se los deja para que se eleven, la igualdad que se les predica? Todo será menos una idea que puedan realizar en bien suyo y de la sociedad. Alguna criatura de esas que tienen en si fuerza superior á todos los obstáculos, aprovechará su aptitud legal para elevarse algo, mucho, tal vez hasta la cima; pero esto no es posible sino por excepción rara, y la regla será que no basta promulgar la igualdad y la libertad para destruir desigualdades esenciales y servidumbres degradantes. Que hoy existen estas desigualdades y estas servidumbres, se ve con sólo abrir los ojos, y que las causas que las producen son generales y profundas también se comprende sin estudio muy detenido. Esta sociedad en que se dice á los hombres que todos son iguales, que deben disfrutar sin condición de todos los derechos políticos, está organizada de modo que hay en ella desigualdades permanentes, esenciales, no de individuos, sino de masas, ó lo que es lo mismo, causas de perturbación constante en la existencia de elementos contradictorios y poderosos que chocan entre sí.

Todos elegibles y todos electores: esta es la fórmula de la igualdad política, el ideal de la democracia, y sería el nuestro si en razón ó justicia todos tuvieran aptitud para ser elegidos y para elegir.

La política parece que es alguna cosa fácil que cualquiera puede saber, ó ciencia infusa congénita en los predestinados, ó misterioso conocimiento que se comunica al ungido con una credencial ó una acta por la voluntad del pueblo ó del rey. No se proclama la igualdad para el ejercicio de ninguna profesión; con título ó sin él, se quiere que el médico sepa medicina, leyes el abogado, ciencias exactas, físicas y sus necesarias aplicaciones el ingeniero; no se permite que nadie sin estudios previos cure á una vaca ó á un caballo, y para poner la mano en las llagas sociales, para influir directa y poderosamente en la prosperidad, en la moralidad, en la honra de un país; para estar al frente de una provincia, de un centro directivo; para ser embajador, senador, ministro ó diputado, no se exige garantía alguna intelectual, ni moral, y sin ciencia y sin experiencia se administra, se gobierna y se manda.

Dicen que la política todo lo invade, lo trastorna y lo mancha; pero no se notan bastante los elementos de anarquía que lleva en su seno una política que da acceso á los puestos más importantes como se da entrada en los teatros sin más que enseñar un billete que se llama credencial. De este modo no hay ineptitud que no se habilite, medianía que no se aliente, inmoralidad que no se estimule, ambición bastarda que no se justifique, ni desorden sin excusa, ni escándalo que no tenga precedentes. En la política, por la política y para la política se cometen indignidades que avergonzarían fuera de ella, y para elevarse ó sostenerse hacen los hombres políticos cosas que no harían en su propiedad como propietarios, en el ejército como militares, en las obras como ingenieros, á la cabecera del enfermo como médicos, en los tribunales como jueces, ni aun en el foro como abogados.

Y ¿qué es la política ante la cual todos son iguales y que admite servidores y oráculos sin condición alguna? ¿Es alguna cosa de poca importancia ó de influencia pasajera que brilla ó escandaliza momentáneamente, sin llegar con su beneficio ó su daño á las entrañas de la sociedad? No, por desgracia. La política administra, organiza los servicios del Estado y dispone las condiciones que han de tener los que han de prestarlos. La política nombra al empleado probo é inteligente, ó al incapaz venal y defraudador de la Hacienda; la política pone la correspondencia pública en manos diligentes y honradas, ó torpes y rapaces; la política premia la lealtad y el valor, ó los posterga á la traición vil ó cruel; la política protege y honra á la ciencia, ó procura escarnecerla y la persigue; la política envía á los desvalidos, representantes del Estado, que los socorren ó que los explotan; la política pide con parsimonia soldados y dinero, ó es pródiga de los bienes del pueblo que empobrece y de la sangre de los hombres que sacrifica; la política aplica los recursos del Estado adonde son útiles, ó perjudiciales, y patrocina la ignorancia, ó difunde la instrucción; la política pone coto al crimen, ó le alienta con la impunidad y tal vez le premia; la política promulga leyes buenas y malas, las respeta ó las infringe. Todas estas cosas realiza la política, según es ignorante ó ilustrada, inmoral ó equitativa, y ya se ve su importancia inmensa. El que, viendo el giro que toma, dice que _no quiere meterse en política_ y se aleja totalmente de ella, tal

vez no piensa en la gravedad de su determinación y todo lo que abandona á los que reprueba y pone en manos que no le parecen puras.

Pero la política no se hace sola; obra es de los hombres, y no puede ser indiferente para ella las condiciones que impone á los que admite y el poder que les da. Atendidas las ideas y sentimientos, el modo de ser de los pueblos hoy, aun de los más cultos, la política no puede ser la fase mejor de un país moralmente considerado, y si es posible que se purgue de todas sus impurezas, ese día no llegó, y, según todas las apariencias, está muy lejos aún. La política internacional es la _diplomacia_, sinónimo de astucia, de engaño, de abuso hipócrita de la fuerza, de abandono del amigo leal, de alianza con el enemigo odioso, todo á impulso de pasiones ciegas ó cálculos egoístas. La política nacional no se sustrae tan cínicamente á toda ley equitativa, no proclama tan alto la omnipotencia de su poder, ni se cree tan desligada de la justicia; pero no deja por eso de asestarle terribles golpes. Debe reconocerse que una parte del mal (más ó menos, según los países) es inevitable, pero que otra podía minorarse, y que si la política será siempre ó por mucho tiempo la esfera menos diáfana y elevada en que gire la actividad de un pueblo, algo puede purificarse modificando una organización, ó más bien una anarquía, que con aparente igualdad establece el privilegio para la ignorancia atrevida y poco escrupulosa.

El primer bien de suprimir esta anarquía sería limitar la esfera de acción de la política y, por consiguiente, sus medios de perturbación. Si en vez de esa igualdad anárquica que incondicionalmente da acceso á la casi totalidad de los cargos públicos se impusieran condiciones de ingreso y de ascenso, y una razonable jerarquía, organizando la Administración, se purificaría en cuanto es posible la política. Uno de los más poderosos elementos que la corrompen es la facultad de recompensar á los que emplea, y de seducir la ambición ó la pobreza con la perspectiva de un cambio ventajoso. Quitad á la política ese campo de igualdad anárquica donde crecen tantas malas hierbas; quitadle el poder de dar destinos, y pondréis coto á su inmoralidad poniéndole á su poder. Medios corruptores tendrá todavía, pero se limitarán mucho con una jerarquía fuerte en la Administración, donde no puede quitar y poner, ni aun trasladar á su antojo.

Si la política que manda hallara un obstáculo á sus desmanes en el orden jerárquico administrativo, la política que aspira á mandar se moralizaría también; si los que conspiran no ofreciesen destinos y empleos y pudieran darlos el día en que triunfen, tendrían menos secuaces y más honrados.

Aun para los cargos puramente políticos no deberían ser todos igualmente elegibles y nombrables. Ya que no se pueda evitar, por ahora al menos, que el nuevo ministro nombre nuevos gobernadores, siquiera que tenga que nombrarlos entre personas con ciertas condiciones de ciencia y de experiencia, y que se necesitasen también para formar parte del gobierno y de la representación nacional.

¿Se evitarían con esto todos los males, ni aun el mayor número? Creemos que no. ¿Se disminuirían algo, acaso bastante? Nos parece que sí. Cuantos más elementos sociales se sustraigan al poder de la política, tanto menos temibles serán sus abusos, que se limitarían así de dos modos: purificando en lo posible su esfera de acción, y reduciéndola; porque con la facilidad de hacer mal crece el deseo de hacerle, y si todos los poderes sin límites se desmoralizan, es porque la injusticia constante é impunemente repetida forma como un foco purulento que inficiona la voluntad y hasta la inteligencia.

Si no creemos que cualquiera puede ser elegido y nombrado para cargos políticos ó administrativos que la política se apropia, desmoralizándose y desmoralizándolos, tampoco somos de parecer que cualquiera puede elegir y nombrar, sino que la elección y el nombramiento deben hacerse por quien sepa lo que hace y quiera hacerlo bien.

Donde sea muy grande la desigualdad social, no puede ser una verdad la igualdad política. Con la miseria y la ignorancia generalizada, ¿qué resultado dará el sufragio universal? ¿Qué es el _voto_ del que no puede tener _opinión_? Este voto será llevado al bien ó al mal; y cuando el mal sea más fácil, cuando sus corrientes sean más fuertes, como no es escrupuloso en los medios que emplea, el voto del que le da sin saber lo que hace, es de temer que se deposite en la urna del cálculo, de la intriga ó de la ambición. Unos pocos más atrevidos, menos escrupulosos, más diestros, arrastran á la ciega multitud, y resulta que el sufragio universal, lejos de hacer prevalecer la opinión del mayor número, da el triunfo á la voluntad de unos pocos, que sofocan la opinión verdadera bajo el peso de la fuerza numérica. Si la multitud, en vez de ser arrastrada, arrastra por un momento, las cosas no irán mejor, porque la ignorancia omnipotente aspira siempre á lo _imposible_; la muchedumbre no tarda en verle delante de sí como un abismo; se aterra, se para y pide que la aparten de allí, sin detenerse mucho en las condiciones que le impone el que se ofrece á servirla de guía.

Sobre que el sufragio universal no es un medio de saber lo que quiere la mayoría, su voluntad, caso de investigarse por este medio, no debe admitirse como regla sino en tanto que se ajuste á la razón, y nos parece que no estaba fuera de ella el que ha dicho que «la voz del pueblo era la voz de Dios, _cuando no era la voz del diablo_». No hay que creer en la infalibilidad de las mayorías, ni en su acierto, cuando no tienen elementos para juzgar de lo que deciden.

Los que pretenden dar al pueblo un _poder_ que no está en armonía con su _saber_, le comprometen más que le sirven; le dan una arma que no sabe manejar, y no es raro que con ella se hiera. ¡Cuántos déspotas se han elevado en virtud del sufragio universal, cuántas leyes hechas por el pueblo contra el pueblo mismo! Si no tiene la instrucción y la independencia suficiente, es el regimiento que recibe del coronel la orden de votar; la aldea que dirige el párroco ó el señor de la tierra; la fábrica cuyos operarios siguen al dueño de ella ó á algún otro que tal vez no los guíe mejor.

No pretendemos que los derechos políticos constituyan privilegio, sino que se condicionen razonablemente de modo que puedan ser una verdad y que no se vuelvan precisamente contra aquellos mismos á quienes se dan. Lo que la ley debe en nuestro concepto buscar principalmente, es saber, independencia y dignidad. El mendigo; el dedicado al servicio doméstico; el soldado[5]; el colono que absolutamente depende del señor; el que no tiene ni instrucción primaria, ni industrial, y no sabe sino remover mecánicamente la tierra, ó elevar pesos ó variarlos de un sitio á otro, á ningunos de éstos daríamos derechos políticos, porque de hecho no son ellos los que lo ejercen, sino alguno que así puede dirigirlos como extraviarlos, y muchas veces los extravía.

[5] Mientras el ejército esté organizado como lo está hoy, no debe equivocarse el _soldado_ con el _ciudadano armado_.

Puesto que la moralidad (salvo en los casos de intervención de los tribunales) es imposible de investigar, la ley electoral debe buscar la capacidad y la independencia; donde quiera que haya alguna instrucción industrial ó literaria, allí debe dar voto; y si esta instrucción no existe, no se deberá suplir con un recibo del que recauda los impuestos. La independencia se dirá que está más en la moralidad y en el carácter que en la posición, y así es cierto; no hay posición que asegure de la servidumbre, de la codicia, del cálculo ambicioso, de las pasiones violentas ó viles que dan el voto contra razón y conciencia; pero esto sólo prueba los límites de donde no puede pasar la ley y su impotencia para suplir la falta de moralidad.

En un país corrompido, tiene que estarlo la política, haya igualdad ó privilegio, tengan derechos políticos unos pocos, un gran número ó todos; pero no pone remedio á esta dolencia, antes la agrava, el sufragio universal. Los que abogan por él en un pueblo ignorante y sin costumbres políticas, parece que no saben cómo se ejerce; porque aun cuando fuera razonable atenerse á la voluntad de los más cuando no está ilustrada, no hay medio de saber esa voluntad; lo repetimos, aunque ni decirlo debiera ser necesario para todo el que no se niegue á la evidencia y no cierre los ojos á la realidad de cómo pasan las cosas: conceder voto á todos incondicionalmente, cuando todos no tienen la ilustración y la independencia necesaria, es dejar en manos de unos pocos un poder inmenso é irresponsable, lanzar al mundo político una porción de ceros que no tienen más valor que el que les da una cifra que se pone delante para mal ó para bien, generalmente para mal.

La sociedad debe hacer de modo que no haya en su seno masas que nada entienden de derechos políticos, que no les dan valor alguno, que carecen de independencia para ejercerlos; pero cuando estas masas existen, la ley política no ha de prescindir de ellas, ni suponer que se regeneran con admitirlas á votar. La ley electoral tiene que tomar las cosas como están, y los hombres como son, en el momento en que se promulga; á otras leyes y disposiciones incumbe procurar que sean lo que deben ser, con aptitud intelectual y moral que no haga ilusoria ó peligrosa la legal.

La igualdad política no puede ser independiente de la social; tiene que haber una relación íntima entre la instrucción y bienestar de un pueblo y sus derechos políticos si no han de ser letra muerta ó causa de daño. ¿Quiere esto decir que es necesario que todos sean ricos y doctores para establecer el sufragio universal?

No; recordemos lo dicho anteriormente: la igualdad es la _semejanza necesaria_ entre las personas ó cosas que se comparan según el objeto á que se destinan; y cuando se comparan dos hombres con el objeto de que elijan un diputado, se los puede calificar de igualmente aptos aunque difieran mucho respecto á cultura y riqueza. Reconocer la semejanza _suficiente_ y no prescindir de la _necesaria_, esto debe hacer la ley política al conceder ó negar derechos.

La ley electoral hoy vigente en España[6] se aproxima á lo que, en nuestro concepto, debe ser la que favorezca una razonable igualdad. Con quitar el voto á quien no sabe leer y escribir por mucha contribución que pague, y dárselo á obreros que no sólo tienen instrucción primaria, sino alguna industrial, nos parece que en este punto se llevaría la igualdad política hasta donde debe llevarse, sirviendo mejor á la democracia que con esas concesiones que no puede utilizar y que tantas veces lo convierten en

daño y descrédito suyo.

[6] Cuando se escribió había sufragio restringido.

Se dice que si las masas no tienen voto, si no toman parte en la formación de la ley, ésta se hará en daño de ellas. Esto es cierto en parte, en parte nada más, y no se evita con la incondicional igualdad política, porque, ya lo hemos dicho, no es lo mismo _tener voto_ para la elección de legisladores, que _tener parte_ en la formación de las leyes.

Decimos que el mal no es cierto sino _en parte_, porque impulsados por motivos muy diferentes de ambición, de vanidad, de orgullo, de amor á la justicia, de lástima por la desgracia, por haber salido del pueblo ó por amarle sin pertenecer á él, hay muchos que hacen suya su causa, viven defendiéndola y acaso mueren por defenderla. Mejor sería que él solo sostuviera su derecho, que no necesitara de campeones, pero debe hacerse constar que los tiene.

Los redentores políticos del pueblo no suelen salir de sus filas, pero no hay que concluir de aquí que su redención sea imposible: concurren á ella el sentimiento universal de la justicia, los ambiciosos que la invocan y hasta cierto punto tienen que servirla para que les sirva de arma; los hijos de ese mismo pueblo que, ilustrándose por las armas ó por las letras, dejan de pertenecer á él, pero no se olvidan, y quieren defender sus derechos y consolar sus dolores; los que, habiendo nacido en las clases privilegiadas, desertan noblemente, y van á formar en las filas de los débiles para instruirlos y disciplinarlos: éstos son los elementos del verdadero progreso. Pero de los ambiciosos salen esos despertadores de las malas pasiones de la multitud, que se elevan adulándola. De los que se han emancipado por su mérito, salen los vengativos que por amor propio quieren humillar á las altas clases que los han humillado ó los humillan. De los generosos desertores salen los entusiastas que, juzgando á los otros por sí mismos, creen el bien fácil de realizar porque en su noble alma no halla obstáculos. Así no faltan nunca visionarios que formulan errores, furiosos que los sostienen y astutos descreídos que los utilizan: así el progreso humano ve salir de entre sus partidarios tal vez los mayores obstáculos que necesita vencer.

Como no puede haber derechos imposibles, el sufragio universal no puede ser un derecho. ¿Qué se busca en el sufragio universal? La opinión del mayor número. ¿Y cuando el mayor número no tiene opinión? Se busca una quimera. Si alguna vez la instrucción se generaliza bastante para que el sentido común y el buen sentido sean una misma cosa, podrá establecerse la igualdad política; mientras esto no suceda, no existirá aunque se escriba en la ley, y nótese que en la ley no debe existir nunca lo que no puede existir en la sociedad, á menos de socavar una de las bases del derecho.

¿Cuál deberá ser la medida de la desigualdad de los derechos políticos? Si fuera posible, la capacidad del que ha de ejercerlos. Los votos deberían pesarse, pero la imperfección humana se ve en la triste necesidad de contarlos, y el código político, como el criminal, necesita establecer cierta igualdad, no porque la igualdad sea la justicia, sino porque la justicia es imposible. La ley no puede decir á N., ingeniero: «Tu opinión valdrá veinte votos»; y á su ayudante: «La tuya valdrá dos», porque ni es posible medir con exactitud los grados de inteligencia, ni, caso de que lo fuese, se aceptaría por el mayor número la clasificación; pero la ley puede decir al obrero que cava la tierra en ese mismo camino trazado por la inteligencia educada de un hombre ilustrado: «Tú no puedes tener voto, porque tu ignorancia no te permite tener opinión.»

La ley es justa cuando, para dar derechos políticos á los ciudadanos, les exige una garantía de capacidad; la ley es injusta siempre que niega voto al que _puede_ tener opinión. El legislador debe investigar con sagacidad y buena fe qué profesiones ú oficios suponen cierto grado de inteligencia para concederles los derechos políticos, para que no se vea el absurdo y la injusticia de que un hombre que tiene, que debe tener, mucha más capacidad que otro por su posición social, carezca del voto que á aquél se concede porque paga contribución _directa_.

El espíritu de la ley no es, ó por lo menos no debe ser, considerar la riqueza de los ciudadanos como una garantía de acierto en la elección de sus representantes; no falta quien la considere así, y aun ha habido alguno que ha pretendido que si el que paga mil reales de contribución tiene un voto, el que paga mil duros debe tener veinte; de modo que los grandes capitalistas y los grandes propietarios depositarían en las urnas electorales su voto, equivalente á quinientos ó mil de los del común de los electores. Esto, por más absurdo que parezca, es lógico si la riqueza se toma como garantía de acierto en la elección y se sienta como base: _el que no tiene que perder no debe votar_, porque _¿con qué derecho vota las contribuciones el que no ha de pagarlas?_

La ley, al exigir cierto grado de riqueza para conceder derechos políticos, no puede buscar sino una garantía de capacidad. Supone que cierto grado de pobreza es incompatible con el cultivo de la inteligencia; y así como excluye al que no tiene edad para que sus facultades intelectuales se hayan desarrollado, debe excluir también al que no puede cultivarlas por su posición social. La

desigualdad ante la ley política no tiene, no puede tener, otro fundamento.

Salvo los casos de miseria extrema, la independencia del elector está en su conciencia y en su carácter, no en su posición social, que sólo sirve para evaluar el precio de su voto.

En cuanto á negarlo á los pobres _porque no tienen qué perder_, es un absurdo. El sufragio universal no puede ser un derecho, porque no puede ser una verdad; pero si los pobres pudieran tener opinión, ¿quién se atrevería á negarles el derecho de emitirla? ¡No tienen qué perder!

Cuando los ricos defraudan, dilapidan, ó por falta de concierto emplean mal las rentas del Estado, y aumentan los gastos y votan contribuciones, ¿quién las paga sino los pobres, y sobre quién pesan con más dureza? La contribución _molesta_ al rico: al pobre le oprime, le arruina tal vez. Cuando los ricos tienen mal montadas las cárceles, ¿quiénes hacen en ellas su aprendizaje, que les conduce á presidio ó al patíbulo? Los pobres. Cuando los ricos no fomentan la agricultura, ni la industria, ni el comercio, ¿quiénes emigran á climas remotos y mortíferos que les son fatales? Los pobres. Cuando los ricos no se esfuerzan en generalizar la instrucción, ¿sobre quiénes caen las fatales consecuencias de la ignorancia? Sobre los pobres. Cuando los ricos hacen leyes injustas, ¿quiénes sufren su influencia fatal? Los pobres. Cuando los ricos no atienden como deben los establecimientos de beneficencia, ¿quiénes padecen en ellos? Los pobres. Cuando los ricos proclaman como una necesidad imprescindible la creación de grandes ejércitos, ¿quiénes dan sus hijos para formarlos? Los pobres. Cuando los ricos declaran la guerra, ¿qué sangre corre en ella? ¡La sangre de los pobres! Y todavía se dice que los pobres no están interesados en el orden _porque no tienen qué perder_. ¿Qué se entiende por _perder_, ó qué se entiende por _orden_?

El pobre es el más interesado en que las leyes sean equitativas; pero el pobre es muy ignorante y no puede contribuir á formarlas: darle derechos políticos es darle un arma que le arrancarán con engaño para emplearla contra él. Este es el verdadero, el único argumento contra el sufragio universal.

Y, sobre negarle, ¿qué importa no estar de acuerdo acerca de los motivos por que se niega? Importa mucho. Si el legislador comprende que la inteligencia es la única garantía que puede y debe buscar, porque la estadística no arroja datos sobre la moralidad, salvo en el caso extremo de que el elector se halle bajo la acción de los tribunales; si el legislador comprende que no debe excluir más que á los muy ignorantes, á los muy viciosos y á los criminales, la ley buscará por todos los medios la capacidad tanto en los electores como en los elegidos, y será justa y equitativa.

La teoría de la igualdad, de que es consecuencia el sufragio universal, en pueblos que no están bastante educados políticamente, es un absurdo que conduce á otro; la que niega derechos políticos á los pobres porque no tienen qué perder, es un absurdo que conduce á una iniquidad.

CAPÍTULO II.

DE LA IGUALDAD Y DE LA LIBERTAD.

Claro está que, al tratar _de las relaciones de la igualdad con la libertad_, se habla de la política; pero ¿constituye la libertad una situación perfectamente definida, y la palabra que la expresa significa una cosa idéntica para todos los que la pronuncian? Parécenos que no. Al decir la libertad de Esparta, de Atenas, de Roma, de las Repúblicas italianas, de Inglaterra, de los Estados Unidos, de Francia, de España, de Italia, de Portugal, ¿no se significan con una misma palabra cosas muy diferentes? La libertad existe con la esclavitud, con el privilegio, con la privación de derechos políticos de la gran mayoría de la nación dominada por la aristocracia, y con la participación de la clase media ó del pueblo todo en el gobierno y poder legislativo. Pueblos constituídos de modos diferentes y aun opuestos, se dice que son ó han sido libres, y Bruto que mata á César en nombre de la libertad, se parecía muy poco á los regicidas modernos que la invocan.

Si la libertad significa cosas tan diferentes según los tiempos y lugares, ¿no tendrá siempre y donde quiera algún elemento común, algo que la hace amable para sus partidarios, santa para sus mártires? Como, á través de tantas diferencias, las religiones tienen de común la idea de Dios, de un poder grande, eterno y justo, ¿no habrá también en la libertad una idea elevada y permanente que inspira al ciudadano de Atenas, de Roma, de Madrid y de Londres? A nuestro parecer este factor común existe, y es _la idea de ley_; aquella dignidad que da al hombre obedecerla y cumplirla como expresión de la justicia, en vez de humillarse ante la voluntad de un déspota ó de un tirano. Esta ley varía según el estado moral é intelectual del pueblo que rige; sus beneficios comprenden á unos pocos, á muchos, á todos, y es la libertad aristocrática, burguesa ó democrática; pero es ley siempre, y por

eso los pueblos le dan el mismo nombre y, si no están degradados, la saludan con respeto.

La ley es regla de justicia, tal como la comprende el legislador ó como la cree practicable; puede equivocarse de dos modos: ó desconociendo la justicia en principio, ó la situación del pueblo donde quiere realizarla. Cualquiera que sea la esfera de acción de la libertad, no se sustrae á las condiciones de toda regla de justicia; puede ser mal comprendida y mal aplicada.

La justicia no se conoce como una verdad matemática ó física; no se hace su _descubrimiento_ en un día para siempre, sino que poco á poco se va comprendiendo y á medida que se practica; por eso la libertad puede ser privilegio ó licencia, equitativa ó injusta, verdadera ó quimérica, elemento de bienestar ó de ruina, según que se armonice ó no con la justicia y las condiciones de inteligencia y moralidad del pueblo que la invoca.

De aquí se infiere que la libertad no puede sustraerse á la influencia del progreso, que se perfecciona á medida de él, y que el pueblo más libre será el pueblo más adelantado. Muchos hechos pasados y presentes podrán citarse tal vez para contradecir lo dicho; pero la contradicción será aparente y fundada en no definir bien el progreso, que es perfección moral y material, ni la libertad, que es ley equitativa y armónica con esta perfección en el pueblo que rige.

Acaso se citen las hordas salvajes cuyos individuos son libres, ó á Mme. Staël que ha dicho: _la libertad es antigua y el despotismo moderno_; si hubiese exactitud en la frase, no la habría en la afirmación de que el hombre progresa.

El salvaje es esclavo de las leyes físicas y de las necesidades materiales: el hambre, la sed, el frío, el calor, son los dueños y señores de su existencia, empleada en luchar con animales feroces ó con hombres que le disputan la comida y el albergue. Esta esclavitud es tan grande, tan continua, tan general y tan fatal, que se hace exclusiva de ninguna otra; ¿qué medios tiene el tirano, ni qué atractivos la tiranía ó el despotismo, en un pueblo que el hambre dispersa de día y el cansancio reune de noche? Las leyes físicas y fisiológicas son las únicas que imperan allí, y llamar libertad á la servidumbre que imponen, es hablar con bien poca exactitud. Si se dice que el salvaje no es esclavo de su compañero de horda, se dice bien; si se afirma que es un hombre libre, no, y basta para convencerse tener idea de lo que es libertad.

Entendemos por libertad _el ejercicio armónico de las relaciones de los hombres que componen un pueblo, condicionadas por la ley que concurren á formar directa ó indirectamente_.

La definición podrá no ser buena, se darán otra ú otras mejores; pero en ninguna cabrá la situación del salvaje, independiente, no libre, y cuya independencia no puede confundirse con la libertad, porque no es una armonía establecida por el derecho, sino una negación que resulta del aislamiento. Así como la igualdad en el estado salvaje es la miseria y la ignorancia de todos, la libertad es el poder que tiene cada uno de utilizar sus fuerzas físicas para buscar sustento y defenderse de cualquiera agresión ó vengarla. El abuso de la fuerza (en el escaso número de relaciones sociales del salvaje) está contenido, no por la idea del derecho, sino por otra fuerza, y cuando ésta no existe, lejos de haber libertad hay opresión; la mujer se esclaviza y el prisionero se inmola.

Más adelante se perdona la vida á los vencidos, que pierden la libertad, y se establecen esclavitudes y servidumbres de distintos grados y formas que, variando y adaptándose al medio social que los rodea, se sostienen en medio de imperios y repúblicas que se derrumban y parecen haber hallado el secreto de la inmortalidad. La ruda Esparta, la culta Atenas, Roma la maestra del derecho, los independientes hijos de los bosques de la Germania y de la Galia, ungidos por el sacerdote cristiano, todos tienen esclavos y siervos, y los humillan, oprimen y explotan.

Eso que se llama _libertad antigua_ es la de unos pocos hombres libres en medio de muchedumbres esclavas ó siervas, tan abrumadas á veces y tan envilecidas, que carecen de aptitud para emanciparse, se petrifican en inmovilidad desesperada, ó se agitan en orgías políticas, cayendo embriagadas á los pies del tirano común. El árbol se conoce por sus frutos, y no lo han sido de bendición los de la libertad de las repúblicas antiguas, ni podían serlo, porque los hombres libres que tienen esclavos, ó los emancipan ó se corrompen, y la corrupción mata la libertad. Esta no marcha ordenada y paralelamente con la servidumbre, no pueden armonizarse, una de los dos destruirá á la otra ó será destruída.

Y ¿cuáles son las relaciones de la igualdad con la libertad? ¿Se favorecen? ¿Se perjudican? ¿El nivel se convierte fácilmente en yugo, ó basta que los hombres sean iguales para que sean libres?

Deben notarse las analogías que existen entre la marcha de la igualdad y la de la libertad. De la igualdad salvaje hay que pasar por la desigualdad de la barbarie y de la civilización imperfecta, hasta llegar á la igualdad de los pueblos cultos y prósperos; de la independencia salvaje hay que pasar por dependencias, servidumbres y esclavitudes en que no existe ó es un privilegio la libertad,

que sólo puede constituir el patrimonio de todos, en los pueblos más avanzados.

Para saber cuáles son las relaciones de la igualdad con la libertad, y si mutuamente se favorecen ó se combaten, hay que determinar bien la condición de entrambas.

La igualdad en la ignorancia, en la miseria, en el envilecimiento, no es auxiliar, sino enemiga de la libertad, y en el pueblo en que este deplorable nivel exista, si algunos se elevan sobre él y aspiran á ser libres y lo consiguen, su privilegio será un progreso, un bien, y esta libertad aristocrática preferible á la servidumbre de todos sin más norma que la voluntad del tirano. Hemos dicho ya que la idea de libertad lleva consigo la de _ley_, y preferible es que algunos vivan á su amparo á que todos estén fuera de ella. Más vale que la libertad sea un privilegio como en Esparta, en Atenas, en Roma y en muchos pueblos cristianos hasta estos últimos tiempos, que el despotismo sin límites de Oriente.

Si es preferible que la libertad exista como privilegio á que no exista, es seguro que en esta condición excepcional no puede vivir mucho tiempo; tiene que ensanchar cada vez más la esfera de sus beneficios; que admitir en sus filas á los que han nacido en su seno; que alimentar en él á los que combaten muchos de sus principios, y transformarlos; que transmitir en derredor la luz de su inteligencia y la dignidad de su nobleza; que extender la honra para poner límites á la ignominia y, en fin, que llevar en sus entrañas un germen poderoso de amor á la humanidad para poder un día fraternizar con el pueblo. Cuando estas condiciones faltan, la libertad que no puede comunicarse y extenderse muere á manos del populacho, de una oligarquía ó de un tirano.

Si la igualdad en la miseria, la ignorancia y la ignominia no puede ser favorable á la libertad, también son incompatibles con ella las grandes diferencias esenciales y permanentes que constituyen la efímera libertad privilegiada. La libertad que echa raíces es la que se extiende, la que en armonía con la igualdad, que consiste en elevar á los de abajo, no en deprimir á los de arriba, es progresiva y cuenta cada día mayor número de hombres libres, es decir, de hombres _verdaderamente_ iguales ante la ley, que la comprenden, que la respetan y que contribuyen á formarla.

Decimos _verdaderamente_, porque hay muchas igualdades que, por más que se consignan en los códigos, no son verdad: tal es la igualdad política que da voto al que no tiene opinión ó no puede expresarla libremente; tal la igualdad social que admite á redimirse del servicio militar á los que, viviendo en la miseria ó en la pobreza, es de todo punto imposible que se rediman; estos llamados derechos no son favorables á la libertad, que no puede tener por aliada sino la igualdad verdadera y digna, no la que alucina con ficciones ó degrada en la ignominia común.

La igualdad racional y posible no nivela las fortunas, pero tiende á disminuir el número de los opulentos y de los miserables, y en consecuencia los vicios, favoreciendo la libertad, porque el gran aliado del despotismo es la corrupción.

La igualdad tiende á ennoblecer el trabajo hasta el manual; y como el trabajo es moralizador, favorece la libertad.

La igualdad tiende á elevar la idea que el hombre forma de sí mismo; y como el creerse digno conduce á serlo, semejante persuasión es un auxiliar de la libertad.

La igualdad tiende á generalizar la instrucción y favorece la libertad.

La igualdad tiende á confundir las clases, á que fraternicen los hombres; disminuye sus desdenes, sus odios, sus iras, y facilita la armonía necesaria á la libertad.

La igualdad, que supone que, como el derecho, la fuerza está en todos, dificulta que la de uno solo sofoque la libertad.

La igualdad tiene amor á la obra social en que toma parte, y predispone á obedecer á la ley, á formarla y consolidar la libertad.

La igualdad, que despierta muchas ambiciones, opone con su gran número un obstáculo á la ambición de uno solo, que pudiera ser fatal á la libertad.

La igualdad, aunque extraviada por la ira pueda recurrir á la violencia, en su estado normal ama la paz, y es contraria al militarismo, tan peligroso para la libertad.

La igualdad da solidez al urdimbre social; multiplica las piezas que ajustan, las ruedas que engranan, las fuerzas que se transmiten de un modo fácil, los movimientos que cambian de dirección sin paralizarse ni precipitarse. Cuando no hay diferencias esenciales generalizadas, permanentes, irritantes, imposibles de borrar; cuando por la escala social se sube y se baja continuamente; cuando no se sabe dónde empieza una clase y dónde acaba otra; cuando intereses, ideas, pasiones, errores, todo

se cruza, y toma y deja algo al cruzarse, y tiende á entretejerse, en semejante estado social los sacudimientos ni serán tan frecuentes, ni tendrán tanta violencia, ni podrán desencajar los miembros sociales tan fuertemente articulados, haciendo necesarias las dictaduras que aniquilan la libertad.

Todo elemento social es á la vez influído é influyente; pero entre la igualdad y la libertad hay tan íntimas relaciones y tan perfectas armonías, que para saber si la igualdad es verdadera basta saber si hace hombres libres, y para juzgar de la libertad no hay más que ver si tiende á que sean iguales.

CAPÍTULO III.

LA LEY QUE EMANA DE LOS PRIVILEGIOS, ¿SERÁ BENEFICIOSA PARA TODOS?

Entendemos por privilegio un derecho que no tiene su base en la justicia: se nos dirá tal vez que nosotros abogamos también por los privilegios puesto que combatimos la teoría de la igualdad y el sufragio universal, que es su consecuencia, y que los ciudadanos á quienes en virtud de su capacidad concedemos los derechos políticos son otros tantos privilegiados con respecto al gran número á quien negamos este derecho: no hay más diferencia que las condiciones con que concedemos este privilegio; pero esta diferencia es tan esencial, que, cambiando completamente la índole del derecho, no puede recibir el nombre de privilegio sino confundiendo cosas que no se parecen.

Cuando la instrucción y la moralidad están limitadas á un número muy corto de personas, limitar á ellas los derechos políticos no es concederles un privilegio, sino darles lo que les pertenece; lo que reclamarán, con razón, en nombre del bien del Estado, único origen legítimo de los derechos políticos. Éstos deben extenderse á medida que la ilustración se extiende; y si hay una clase de ciudadanos que, siendo tan ilustrada como otra, no tiene los mismos derechos políticos, hay privilegio, injusticia, y habrá lucha y revolución. La oligarquía, la aristocracia y la democracia son legítimas siempre que son lógicas, y según la ilustración esté en algunos, en muchos ó en todos.

Pero es una gran desgracia para un pueblo que, en circunstancias particulares, establezcan por la fuerza, ó su poca ilustración establezca por necesidad, una forma de gobierno en que sólo tome parte una clase poco numerosa y apartada de las otras por su elevada posición. Esta clase gobernará en provecho suyo, y la dureza de su egoísmo no estará suavizada por la simpatía, por la benevolencia, ni aun por la justicia; porque ya hemos visto que, al dividirse los hombres en clases muy distantes unas de otras, se depravan, se hacen hostiles, y mutuamente se desprecian ó se aborrecen. El gran señor poderoso y altivo no está dispuesto á mirar como semejantes á los individuos de esa plebe miserable y embrutecida, y los oprimirá sin compasión ni remordimiento. Así, por ejemplo, el lord inglés, para vender sus granos á un precio exorbitante prohibirá la importación de cereales, sin cuidarse de que los pobres se mueran de hambre, y no se modificará la horrible ley en nombre de la humanidad ni de la justicia, _sino en nombre de las necesidades de la industria_; ya se ha dicho _que la aristocracia no tiene entrañas_.

La ley hecha por un corto número de personas no podrá ser equitativa ni conveniente á la generalidad. El magnate, no sólo tiene su interés para extraviarle, sino su orgullo y su desdén. Con la más completa seguridad de conciencia niega todo derecho á los que desprecia, y si alguna vez hace la más pequeña concesión, la considera como un acto de heroísmo que no sabe agradecer la plebe ingrata.

A medida que aumenta el número de los que toman parte en la formación de la ley, ésta es más equitativa y humana, no sólo porque están representados los intereses de diferentes clases, sino porque contribuyen á formarla otras ideas, _otros sentimientos_. Creemos que no se nos acusará de _sentimentalismo_ porque hablamos de sentimientos al tratar de los elementos que entran en la formación de las leyes. Los sentimientos del hombre influyen en todos los actos de su vida, le impelen hacia el bien ó hacia el mal, y ante su voz poderosa, más de una vez la razón y hasta la conciencia aparecen mudas.

Cuando los legisladores, en vez de pertenecer á una clase apartada del pueblo y que le desdeña, pertenecen á clases diferentes que están cerca de él, que con él simpatizan, que conocen sus virtudes, que comprenden sus dolores, que tal vez le deben sus más ilustres hijos, la ley refleja esta diferencia. El hombre lleva sus sentimientos al santuario de las leyes, como los lleva á todas partes: allí influyen en su conducta; y cuanto sean más humanitarios, las leyes que formulen serán más beneficiosas para la humanidad.

En igualdad de todas las demás circunstancias, la ley será tanto más justa cuanto sea mayor el número de clases que contribuyen á formarla; por eso deben extenderse los derechos políticos hasta donde sea compatible con la ilustración. Si alguna vez nos

parece hallar á esta regla excepciones, no es porque las tenga, sino porque acaso tomamos los problemas sociales por problemas políticos, desconocemos la influencia que aquéllos ejercen en éstos, y somos como el químico que atribuye á un cuerpo propiedades que no tiene, porque ignora que son dos los que contribuyen al fenómeno que pretende explicar.

CAPÍTULO IV.

¿ES LO MISMO IGUALDAD QUE DEMOCRACIA?

La igualdad entre los que no tienen ningún derecho y obedecen á la voluntad de uno solo ó á la ley que de él emana, es el gobierno despótico ó absoluto, no la democracia. La igualdad en el derecho político puede mirarse como sinónimo de democracia; cuando todos tienen los mismos derechos políticos, todos contribuyen igualmente á la formación de la ley, al menos en teoría, y democracia es lo mismo que igualdad.

Pero la igualdad política, la que más se debate, la que más se estudia, la que con más energía se reclama, es la menos importante, y si ha de ser algo más que una palabra vana, debe tener su raíz en la igualdad moral é intelectual. ¿Esta igualdad sigue la misma progresión que la igualdad política? ¿El pueblo está en el estado de cumplir los deberes que son consecuencia de los derechos que para él se piden? ¿No hay contradicción ninguna entre el estado social y el estado político á que tienden las sociedades modernas? La igualdad política, la democracia, ¿no tiene algún obstáculo más poderoso que las preocupaciones, los privilegios escritos y las bayonetas? Investiguémoslo.

Hemos dicho ya en la primera parte de este escrito que la igualdad intelectual de los hombres está en razón inversa de su civilización; hagamos algunas comparaciones para fijar más nuestras ideas sobre este importante asunto.

Suprimamos algunos siglos en el tiempo ó algunos centenares de leguas en el espacio. Allí están una piragua y un gran navío. ¿Qué diferencia notamos entre los tripulantes de la primera? Apenas son perceptibles; tal vez un poco más de vigor, de destreza..... en caso de necesidad aquellos hombres pueden suplirse mutuamente sin que sufra trastorno la dirección de la pequeña nave. Trasladémonos al navío: ¡qué distancia del grumete al piloto! El uno es una especie de máquina que por el resorte de la voz de mando sube ó baja, va á la derecha ó á la izquierda; el otro sabe las leyes del mundo físico, determina los movimientos de los astros; es una especie de encantador que á través de las tempestades y de las tinieblas traza un camino por la inmensidad de los mares, y le sigue sin vacilar y sin extraviarse. Probad, si os parece, á sustituir este hombre con el otro, y pronto veréis á la nave zozobrar entre escollos ó estrellarse contra las rocas.

Allí está un hombre que representa una farsa grotesca y á quien desdeñosamente llamamos _histrión_. Si enferma, si muere, poca dificultad habrá en que le sustituya otro de la compañía; cualquiera, aunque sea el que está encargado de subir y bajar el telón. Y ¿cómo reemplazar al artista, al gran artista de nuestros días, á ese mágico que nos agita, que nos conmueve, que nos aterra, que nos electriza, que nos tiene pendientes de su gesto, de su instrumento ó de su voz, que nos hace sentir con su corazón y llorar con sus ojos? ¡Qué diferencia entre esta privilegiada criatura y el comparsa que sale á blandir maquinalmente una espada que no corta, ó lleva en sus manos un instrumento que no suena!

En aquel pelotón de hombres armados hay un jefe algo más diestro y valeroso que la mayor parte de los hombres que le siguen; pero si cae no es difícil hallarle relevo: las maniobras de la pequeña hueste son tan sencillas que hay pocos que no sean capaces de dirigirlas. Mirad ese jefe de Estado Mayor, de artillería ó de ingenieros; ha pasado su vida estudiando; es un sabio; tiene un papel delante y en la mano un compás; medita profundamente: comparadle con el soldado que monda patatas para el rancho.....

Mirad aquellos dos hombres que se dedican á una industria cualquiera; el uno se llama oficial y el otro maestro, pero se echa de ver que el maestro ha sido aprendiz y que el oficial podrá llegar á ser maestro; éste no sabe la razón de la mayor parte de las cosas que practica; aquél imita las que le ve hacer; pronto sabrá tanto como él, pronto sabrá más acaso. Pero hé aquí que pasan unos cuantos siglos, la industria se perfecciona, toma proporciones gigantescas, y en vez de estar dominada por la rutina, viene á ser dirigida por la ciencia. Entrad en esa inmensa fábrica. Ved centenares de hombres haciendo cabezas de alfileres ó pulimentando mangos de cuchillos. Su inteligencia para nada se necesita; el hábito hace que desempeñen maquinalmente la tarea que les está encomendada. Siempre en la misma postura, hacen siempre idénticos movimientos, ejercitan los mismos músculos, pueden mirarse como otras tantas máquinas. Las facultades de su alma se enervan, se extinguen por falta de ejercicio; su cuerpo se desfigura, se debilita; un miembro adquiere un desarrollo anormal, y los otros se extenúan en la inacción. ¿Qué es esto? ¿Cómo se consiente que por sistema el hombre se degrade física y moralmente? ¿Qué organización es la que exige para consolidarse el sacrificio de la dignidad humana? ¡Qué queréis! La ciencia ha dicho que se hace mejor lo que se hace siempre; la

división de trabajo es una indispensable condición del progreso de la industria, y el progreso de la industria es la primera necesidad de un pueblo. Bien está: si la industria reclama víctimas, arrojádselas; entréguensele miles de hombres para que los convierta en máquinas. ¡Si al menos su obra fuera completa! Pero esas máquinas sufren y hacen sufrir, son desdichadas y culpables. Contemplad esas máquinas humanas, pequeños apéndices de los grandes motores, y luego, dejando el taller, subid al despacho del ingeniero. Mirad esa cabeza encanecida antes de tiempo por el estudio, esa frente contraída por la meditación. Asombraos del caudal de conocimientos que ese hombre posee, de la fácil seguridad con que ejecuta prodigios que no comprendéis y se suceden ante vuestros pasmados ojos. ¿Y quién es ese hombre que discurre con él gravemente y tiene el aire de discutir un negocio de Estado, ese hombre que ha salido de un palacio, que ha venido en coche, que habla de las naciones de Europa ó del mundo, y de su ilustración y de sus recursos, que ha viajado, que posee un capital inmenso? Es el dueño de la fábrica, una persona muy instruída, muy inteligente, muy activa, porque la industria en grande escala, la que hace tantos prodigios, necesita actividad, inteligencia y grandes capitales, y como los necesita, los tiene, porque las sociedades modernas no niegan á la industria nada, absolutamente nada de lo que pide.

Mirad aquel hombre mugriento que presta sobre ropa vieja algunas cortas cantidades, y á quien se da desdeñosamente el nombre de _usurero_; ved ese otro, creación de las sociedades modernas, que brilla por su fausto, que deslumbra por sus riquezas, que tiene talento é influencia política; es un capitalista que presta al Rey ó al Gobierno, y recibe en garantía una nación.

No hay por qué continuar estos paralelos: de lo dicho resulta bastante claro que el dogma de la igualdad ha venido al mundo precisamente cuando los hombres son más desiguales. Y no sólo las necesidades de la industria y el estado social exigen de unos pocos grande instrucción é inteligencia y embrutecen las masas, sino que, á medida que los pueblos se han civilizado, los ricos son más ricos y los pobres más pobres. ¿Es éste el estado definitivo de la sociedad? No queremos creerlo, pero es el estado actual. En los grandes centros industriales y las ciudades populosas es cada día mayor la distancia que separa al rico, cuyo lujo aumenta todos los días, del pobre, cada vez más amenazado de la miseria extrema. ¿Qué decimos en las ciudades? En los campos se alza el cultivador capitalista que aplica el vapor á la agricultura, el ganadero opulento al lado del infeliz proletario que ha visto ó verá en breve llegar el día en que no tenga un palmo de terreno común en que pueda cortar un palo de leña, ó mantener una vaca, ni una oveja. Sin entrar en discusiones que no son de este lugar sobre estos fenómenos sociales, notemos solamente que se dice á los hombres: _sois iguales_ cuando hay más diferencias en el desarrollo de sus facultades intelectuales, en su fortuna y en sus goces; el lujo tiene refinamientos, y la miseria angustias que no conocían las sociedades menos civilizadas.

La democracia, al prescindir de la desigualdad social, no la destruye; por el contrario, hace más fatales sus consecuencias, porque se arroja sin precaución en brazos del peligro. A veces cae, ó se para, asombrada de hallar obstáculos invencibles, de ver que de sus propias filas salen tiros que la hieren, por no haber observado que la igualdad política está muchas veces combatida por la desigualdad social.

La democracia adora ciegamente el becerro de oro. Está sedienta de goces materiales, de riqueza, y se preocupa más de producirla que de su distribución. Toma á veces medidas tan insensatas, tan poco en armonía con el objeto que se propone, que no parece sino que ha resuelto suicidarse con una disolución de oro.

El mundo marcha á la democracia; pero es bien que sepa los obstáculos que ha de hallar en el camino para que se prepare á vencerlos; es bien que no se lisonjee con facilidades que no existen. Cuando se sienta como derecho un principio imposible de convertir en hecho, la lucha es inevitable, la lucha con su siniestro acompañamiento de exageraciones, de iras, de represalias. Las represalias en los combates materiales son hombres que se sacrifican; en los del entendimiento, verdades que se inmolan, errores que se enaltecen. Nuestros adversarios, ¿niegan una verdad que sostenemos? Nosotros negaremos inmediatamente otra que ellos afirman. ¿Se parapetan detrás de un error? Levantaremos otro enfrente para guarecernos de sus tiros.

La democracia, como la aristocracia, como todas las instituciones sociales, llama calumnias á las verdades que le dicen sus enemigos, y justicia á las lisonjas de sus parciales. La democracia, que, como empieza á ser poderosa, empieza á ser adulada y á tener pretensiones de infalible, no siempre ve claro, ni escucha distintamente; y deslumbrada por el brillo de sus triunfos, no echa de ver que amamanta en su seno la desigualdad, contribuyendo á que tome proporciones alarmantes. Cerniéndose en la región de las ideas, no teme que los hechos puedan servirle de peligroso obstáculo.

CONCLUSIÓN.

Al terminar nuestro trabajo, no creemos dejar apurada la materia; pero sí nos parece haber tocado los puntos de mayor interés y planteado los problemas de más importancia que la igualdad ofrece. La cuestión está erizada de dificultades, y no obstante, después de haberlas considerado de cerca, no nos parecen tan insuperables. ¿Dependerá esto de que el hombre se familiariza con todo, y el hábito le hace indiferente á la vista del peligro que le aterraba, ó en que, realmente, apartando el error y la pasión del problema de la igualdad, no hay en él nada que deba alarmar ni exasperar á clase alguna? Esta última suposición nos parece la verdadera; y así como el estudio de la Naturaleza convence más y más de la sabiduría del Hacedor, al profundizar en el de la sociedad se ve que si Dios consiente al hombre moverse conforme á su albedrío en una ancha estera, no le abandona, y escribe en su organización leyes eternas que le sirven de antorcha cuando los errores obscurecen la luz de la verdad, y de dique cuando las pasiones se desbordan.

Apartando de la cuestión todo lo que á ella han llevado el espíritu de escuela y de partido, el interés y la cólera, ¿qué es lo que vemos en ella?

La desigualdad de condiciones, que tiene su origen en la naturaleza y su justificación en la necesidad.

El peligro de llevarla más allá de los límites necesarios, y como, pasándolos, los sentimientos se pervierten y las razas se degradan.

La tendencia innata del hombre á reconocer la autoridad, á respetar la jerarquía, á establecer el orden.

Lo absurdo de desplegar grande aparato de fuerza para establecer lo que se establecería por sí solo.

La necesidad de la jerarquía, sin la cual no es posible la sociedad.

La imposibilidad de establecer la jerarquía natural; la conveniencia de aproximarse á ella cuanto sea posible.

La injusticia de atribuir á la jerarquía más derechos de los que tiene, suponiendo que puede pasar los límites que la razón y la humanidad le imponen.

El error de creer que la igualdad ante la ley es la igualdad ante la justicia, y el más fatal todavía de imaginar que la ventura está en razón de la riqueza.

El peligro de dar voto al que no tiene opinión, y la imposibilidad de que realmente pueda tomar parte en la formación de la ley el que tiene su conciencia expuesta á las tentaciones de la miseria, y su razón á las del error.

La imposibilidad de que sea beneficiosa para todos la ley hecha por unos pocos.

El riesgo que la desigualdad aumentada por la civilización presenta á la democracia.

Las facilidades que la igualdad ofrece á la medianía; los obstáculos que opone á las altas concepciones del entendimiento; y, en fin, las razones por las cuales debe considerarse que la igualdad es más bien favorable que enemiga de la libertad.

Examinada la cuestión con imparcialidad, ¿no hay motivo para calmar las iras de los de abajo y el desdén de los de arriba? ¿No se ven claramente los límites puestos por la necesidad y la justicia, y que nadie puede traspasar sin ser insensato ó perverso? ¿No se descubre la profunda raíz de cosas que intentamos derribar por juzgarlas someramente arraigadas, y el íntimo enlace de hechos que suponíamos aislados? ¿No se percibe la razón de ser en muchos fenómenos que aparecían como hijos del capricho ó de la iniquidad? ¿No nos sentimos inclinados á creer alguna cosa que se nos presentaba como dudosa, á dudar alguna que juzgábamos evidente? ¿No hemos modificado algo nuestro modo de pensar ó de sentir? ¿No somos un poco más tolerantes con las pretensiones de los que están más arriba ó más abajo, y con los errores de todos? Después de haber estudiado el problema social de la igualdad, ¿no nos sentimos más fuertes para convencer, y con una mayor tolerancia para ser convencidos?

No nos atrevemos á esperar que se impresione y modifique de este modo el ánimo de los que hayan leído este escrito; pero consistirá en que no hemos tratado el asunto como debía tratarse. ¡Dichoso el que, colocándose á la altura que requiere, haga brillar la verdad con todo su esplendor! ¡Dichoso el que desvanezca con irresistible lógica vanas esperanzas y temores insensatos! ¡Dichoso el que arranque de raíz tantos peligrosos sofismas, y dé al derecho tan ancha base que pueda resistir las oleadas del error, del interés y de la cólera! ¡Dichoso el que, viendo la cuestión de la igualdad por todas sus fases, pueda mostrarla cual es, y sustituya á las prevenciones hostiles los afectos benévolos! ¿Pero quién es bastante poderoso para conseguirlo, para intentarlo siquiera?

En nuestra época, las luchas materiales, aisladas de las del entendimiento, si por acaso existen, duran poco; todo brazo que se levanta y hiere y vuelve á herir, sabiéndolo ó sin saberlo, obedece á una idea, y si pudiera establecerse la armonía en las regiones de la inteligencia, reinaría muy pronto en el mundo material: de aquí la importancia de la teoría, y su poder y su responsabilidad. La teoría forma escuela; la escuela forma partido; el partido forma en batalla las masas armadas ó los ejércitos, y los ejércitos y las masas, acentuando su cólera con el estruendo de la artillería, escriben con sangre todo lo que han aprendido. El error y la pasión, llamando derecho á una igualdad imposible ó á un privilegio injusto, han formado el símbolo de la guerra; apresurémonos á rectificar las ideas, á investigar la verdad, y sin más que formularla, escribiremos el símbolo de la paz.

No podemos concluir este escrito sin manifestar un recelo que nos aflige. El lector, ¿dudará de la sinceridad de nuestras palabras porque á veces parece como que sostenemos el pro y el contra de todas las opiniones, ejercitándonos en una especie de equilibrios intelectuales?

Acaso se disguste de ver que no somos aristócratas, ni demócratas, partidarios del privilegio, ni niveladores, y aun sospeche de nuestra fe política notando nuestros recios ataques á campos opuestos, porque en materias en que la pasión deja rara vez de tomar parte en los fallos, suele llamarse escepticismo á la imparcialidad. Y no es que nosotros presumamos de la nuestra: hemos empezado y concluímos desconfiando de ella; mas queremos hacer notar que el asunto está entre dos escollos: ser parciales ó parecer escépticos; tal vez hemos dado en entrambos, porque no basta ser sincero para ser exacto; hay una imparcialidad que está en la inteligencia, y consiste en ver todos los lados de una cuestión; hay otra, la del corazón, que consiste en decir con lisura lo que se ve: nosotros no podemos responder más que de esta última.

Nuestro modo de discurrir podrá chocar alguna vez con las preocupaciones de la gente despreocupada, que son las más arraigadas; pero cuando hemos creído ver clara la verdad, no hemos vacilado en formularla, porque el error es una arma que acaba siempre por dispararse contra el que la emplea, y hay riesgo en suprimir la lógica de los razonamientos no pudiendo suprimir la de las cosas. ¿De qué sirve decir al pueblo ni á los poderosos: «Marchad por el vasto campo que os abre nuestro buen deseo», si se verán detenidos por la realidad, esa jaula férrea, cuyas barras no ceden nunca y rompen los miembros del que intenta forzarlas? ¿Cuál es el más amigo del pueblo? ¿El que niega la existencia de sus males y los cubre con recamado manto, ó el que los pone de manifiesto para curarlos? ¿Son un bálsamo para los dolores reales las mentidas seguridades de que no existen? La beatitud que proporciona el error es como la del opio: mata al que á ella se entrega, y la verdad es la lanza fabulosa, cura las heridas que hace.

FIN.

ÍNDICE.

Págs.

INTRODUCCIÓN 5

PARTE PRIMERA.

De la igualdad considerada social y filosóficamente.

CAPÍTULO I.--Nociones generales 13

CAPÍTULO II.--De la igualdad, de la identidad, de la semejanza y de la equivalencia 23

CAPÍTULO III.--Origen y progresos de la desigualdad 41

CAPÍTULO IV.--Cómo se perpetúa la desigualdad injusta 69

CAPÍTULO V.--¿Cuándo, cómo y con qué consecuencias se perpetúa la desigualdad ó se restablece la igualdad? 73

CAPÍTULO VI.--¿En qué esfera se establece primeramente la igualdad? 89

CAPÍTULO VII.--Límites de la igualdad 99

PARTE SEGUNDA.

De la igualdad socialmente considerada.

CAPÍTULO I.--Influencia recíproca de los elementos físico, intelectual y moral, y de la semejanza necesaria y suficiente para establecer la igualdad 111

CAPÍTULO II.--¿Qué límite debe tener la desigualdad? 127

CAPÍTULO III.--Consecuencias de la desigualdad social del hombre y la mujer 143

CAPÍTULO IV.--La igualdad ante la ley ¿es la igualdad ante la justicia? 167

CAPÍTULO V.--De la equivalencia 173

CAPÍTULO VI.--Que los hombres no han menester ocupar en la sociedad posiciones iguales para ser igualmente dichosos 181

CAPÍTULO VII.--La propiedad y la igualdad 197

CAPÍTULO VIII.--De la asociación y de la igualdad 213

PARTE TERCERA.

De la igualdad considerada políticamente y en sus relaciones con la libertad.

CAPÍTULO I.--De la igualdad social y de la igualdad política 221

CAPÍTULO II.--De la igualdad y de la libertad 245

CAPÍTULO III.--La ley que emana de los privilegios ¿será beneficiosa para todos? 257

CAPÍTULO IV.--¿Es lo mismo igualdad que democracia? 263

CONCLUSIÓN 273

En pasta española, 2 pesetas más por tomo.

=Escuder.=--Locos y anómalos.--Contiene entre otras importantes cosas: El veterinario de Sueca.--Morillo.--Galeote.--El parricida de Carcagente.--Anomalías sexuales.--La reproducción.--Degeneración de amor.--Espermatorrea.--Epilepsia genérica.--Psicopatía sexual orgánica.--Aberraciones genésicas.--Anomalías sociales.--Degenerados.--Delincuentes.--Borrachos.--Hipnotismo.--El tratamiento de los locos.--El manicomio.--Curación del loco, etc., etc.--Madrid 1895; un tomo en 8.º, 4 pesetas.

=España.=--Tratado práctico del testamento ológrafo.--Madrid, 1896; un tomo en 8.º, 1,50 pesetas.

=García y Romero de Tejada.=--El libro del jurado.--Prontuario teórico-práctico para la más fácil y acertada aplicación del Código penal á los delitos de que conocen los tribunales populares.--1894-97; dos tomos en 4.º, 23 pesetas.

=Giner= (D. F.) y =Calderón= (D. A.).--_Curso de Filosofía del Derecho._--Contiene éste resumen de los principales problemas de la filosofía del Derecho; un preliminar relativo al conocimiento usual del Derecho; una introducción referente al concepto, enciclopedia, fuentes y método de la filosofía del Derecho, y las partes general, especial y orgánica de esta ciencia. En la parte general se trata del concepto del Derecho, sus esferas, relaciones, categorías y elementos, y de la vida jurídica. En la especial, estúdianse las divisiones del Derecho, como derecho de la personalidad y de los fines, y, por último, en la parte orgánica se investiga el Estado, especialmente como Estado del individuo.--Madrid, 1898; tomo I, en 4.º, 7,50 pesetas. Tomo II, en preparación.

=Gómez Acebo y Cortina= (D. José) y =Díaz Merry= (D. Ricardo).--Diccionario general de jurisprudencia contencioso-administrativa.--Colección, por orden alfabético de materias, de todas las sentencias dictadas en asuntos contencioso-administrativos, desde la creación del Consejo de Estado hasta 1888 inclusive.--Madrid, 1889; un tomo en 4.º, 18 pesetas.

=González Cedrón.=--Tratado de contabilidad para la estructura, comprobación y justificación de las cuentas provinciales de la Hacienda pública.--Madrid, 1897; 2 pesetas.

=González Serrano= (D. Urbano).--Estudio sobre los principios de la moral con relación á la doctrina positivista.--1,50 pesetas.

=Gómez y González.=--Faltas subsanables é insubsanables de los documentos públicos sujetos á registros, _en forma_ de Diccionario.--Cárdenas, 1890; un tomo en 4.º, 10 pesetas.

=Goodnow.=--Derecho administrativo comparado, Análisis de los sistemas administrativos de los Estados Unidos, Inglaterra, Francia y Alemania.--Madrid, 1897-98; dos tomos en 4.º, 14 pesetas.

=Heffter.=--Derecho internacional público de Europa. Traducción de Gabino Lizárraga, abogado del ilustre Colegio de Madrid, etc., Esta obra, cuyo mérito está reconocido por todo el mundo, y de que son evidente prueba las traducciones que se han hecho á casi todas lenguas. Su interés no puede desconocerse, al considerar que en ella se tratan todas las cuestiones internacionales, lo mismo en la paz que en la guerra.--Un tomo en 4.º, de 553 páginas, 8 pesetas.

=Janet.=--La familia, lecciones de filosofía moral, obra premiada por la Academia francesa, traducida por el Dr. Luis Marco.--Madrid, 1897; un tomo en 4.º, 5 pesetas.

=Manual del Abogado y del funcionario judicial=, con una extensa introducción sobre el concepto, fundamento é historia de la abogacía; contiene nuevos estatutos de los Colegios de Abogados, disposiciones de las leyes orgánicas, Código civil, penal, Justicia militar, Leyes de enjuiciamiento civil y criminal, del Jurado, de lo Contencioso, del Timbre, Impuestos, Ordenanzas de los Juzgados, Audiencias y Tribunal Supremo, etc., etc., por la redacción de la _Revista de los Tribunales_.--Madrid, 1895; un tomo en 8.º, tela, 4 pesetas.

=Manresa y Navarro.=--Comentarios á la ley de Enjuiciamiento civil, reformada conforme á las bases aprobadas por la ley de 21 de Junio de 1880, publicada para la Península por Real decreto de 3 de Febrero de 1881, y para las islas de Cuba y Puerto Rico por el de 25 de Septiembre de 1885; con los formularios correspondientes á todos los juicios.--Madrid, 1881-97; seis tomos en 4.º, 66 pesetas.

--Comentarios al Código civil español.--Madrid, 1890-98; cinco tomos en 4.º, 51 pesetas.--Tomo sexto en prensa.

=Melgar y Abreu.=--Tratado de expropiación forzosa por causa de utilidad pública, con un prólogo del Excelentísimo Sr. D. Francisco Silvela.--Madrid, 1889; un tomo en 8.º, 6 pesetas.

=Menger.=--El Derecho civil y los pobres, por Antonio Menger, profesor de Derecho en la Universidad de Viena, versión española con la autorización del autor y precedido de un estudio sobre el _Derecho_ y _la Cuestión social_, por D. Adolfo Posada, profesor de Derecho político y administrativo en la Universidad de Oviedo.--Madrid, 1898; un tomo en 8.º mayor.

=Pulido.=--Grandes problemas, por D. Ángel Pulido Fernández, de la Real Academia de Medicina. Contiene: Al Sr. D. M. Menéndez Pelayo.--La alimentación de los pueblos.--El alcoholismo.--El arte médico.--La doctrina bacteriológica.--La despoblación de España.--Madrid, 1892; un tomo en 8.º, 3 pesetas.

--Plumazos de un viajero. París.--Bruselas.--Holanda.--Alemania.--Austria-Hungría.--La Universidad alemana.--El estudiante alemán.--Madrid, 1883; un tomo en 8.º, 3 pesetas.

--El gran pueblo. El monasterio del Paular.--La disección (Descripciones de viaje.)--Madrid, 1893; un tomo en 8.º, con ilustraciones de D. R. Pulido y fotograbados de L. Romea, 3 pesetas.

--Miniaturas científicas: Colección de tesis, con un prólogo de D. José Echegaray. Los temas tratados llevan los siguientes títulos: Medicina árabe.--Educación física de la mujer.--El corro de niñas.--Evolución de las enfermedades.--La Medicina y la pintura.--El Poema de la circulación.--Madrid, 1894; un tomo en 8.º, 3 pesetas.

--La emoción oratoria.--Madrid, 1896; un tomo en 8.º mayor, 3 pesetas.

--La pena capital en España.--Madrid, 1897; un tomo en 8.º, 2 pesetas.

=Ramella.=--Tratado de la correspondencia en materia civil y mercantil, seguido de un estudio referente á la legislación española, por Lorenzo Benito.--Madrid, 1898; un tomo en 4.º, 8 pesetas.

=Repertorio de los Juzgados municipales=, ó sea compilación metodica y práctica de cuantas disposiciones legislativas, fundamentales y complementarias necesitan conocer los jueces, fiscales y secretarios, con aclaraciones y formularios de todas clases, por A. M. L., publicado por la _Revista de los Tribunales_.--Madrid, 1897; un tomo en 8.º, 6 pesetas.

=Riquelme.=--Elementos de Derecho público internacional, con explicación de todas las reglas que, según los tratados, estipulaciones, leyes vigentes y costumbres, constituyen el Derecho internacional español, Madrid, 1875; un tomo en 4.º, de 520 páginas, 6 pesetas.

=Sánchez Ocaña.=--Reglamento de policía minera, anotado y concordado con la vigente legislación general de minas, y con las leyes y reglamentos de Bélgica, Francia, Italia y demás países mineros de Europa, etc., etc.--Madrid, 1897; un tomo en 4.º mayor,

2,50 pesetas.

=Serrano de la Pedrosa.=--El Derecho del pataleo, la política.--Madrid, 1894; un tomo en 8.º, 2 pesetas.

=Villarrazo y González.=--Memoria sobre algunas reformas necesarias en la legislación penal española.--Loja, 1895; 2 pesetas.

Los precios marcados son á la rústica y para Madrid.

II. DIONYSUS

III. ETERNAL RECURRENCE

TRANSLATOR'S PREFACE.

For the history of the text constituting this volume I would refer readers to my preface to _The Will to Power,_ Books I, and II., where they will also find a brief explanation of the actual title of the complete work.

In the two books before us Nietzsche boldly carries his principle still further into the various departments of human life, and does not shrink from showing its application even to science, to art, and to metaphysics.

Throughout Part I. of the Third Book we find him going to great pains to impress the fact upon us that science is as arbitrary as art in its mode of procedure, and that the knowledge of the scientist is but the outcome of his inexorable will to power interpreting facts in the terms of the self-preservative conditions of the particular order of human beings to which he belongs. In Aphorisms 515 and 516, which are typical of almost all the thought expressed in Part I., Nietzsche says distinctly: "The object is not 'to know,' but to schematise,--to impose as much regularity and form upon chaos as our practical needs require."

Unfamiliarity, constant change, and the inability to reckon with possibilities, are sources of great danger: hence, everything _must_ be explained, assimilated, and rendered capable of calculation, if Nature is to be mastered and controlled.

Schemes for interpreting earthly phenomena must be devised which, though they do not require to be absolute or irrefutable, must yet favour the maintenance of the kind of men that devises them. Interpretation thus becomes all important, and facts sink down to the rank of raw material which must first be given some shape (some sense--always anthropocentric) before they can become serviceable.

Even the development of reason and logic Nietzsche consistently shows to be but a spiritual development of the physiological function of digestion which compels an organism to make things "like" (to "assimilate") before it can absorb them (Aph. 510). And seeing that he denies that hunger can be a first motive (Aphs. 651-656), and proceeds to show that it is the amœba's will to power which makes it extend its pseudopodia in search of what it can appropriate, and that, once the appropriated matter is enveloped, it is a process of making _similar_ which constitutes the process of absorption, reason itself is by inference acknowledged to be merely a form of the same fundamental will.

An interesting and certainly inevitable outcome of Nietzsche's argument appears in Aph. 516, where he declares that even our inability to deny and affirm one and the same thing is not in the least necessary, _but only a sign of inability._

The whole argument of Part I. tends to draw science ever nearer and nearer to art (except, of course, in those cases in which science happens to consist merely of an ascertainment of facts), and to prove that the one like the other is no more than a means of gaining some foothold upon the slippery soil of a world that is for ever in flux.

In the rush and pell-mell of Becoming, some milestones must be fixed for the purposes of human orientation. In the torrent of evolutionary changes pillars must be made to stand, to which man can for a space hold tight and collect his senses. Science, like art, accomplishes this for us, and it is our will to power which "creates the impression of Being out of Becoming" (Aph. 517).

According to this standpoint, then, consciousness is also but a weapon in the service of the will to power, and it extends or contracts according to our needs (Aph. 524). It might disappear altogether (Aph. 523), or, on the other hand, it might increase and make our life more complicated than it already is. But we should guard against making it the Absolute behind Becoming, simply because it happens to be the highest and most recent evolutionary form (Aph. 709). If we had done this with each newly acquired characteristic, sight itself, which is a relatively recent development, would also have required to have been deified.

Pantheism, Theism, Unitarianism--in fact all religions in which a _conscious_ god is worshipped, are thus aptly classed by Nietzsche as the result of man's desire to elevate that which is but a new and wonderful instrument of his will to power, to the chief place in the imaginary world beyond (eternal soul), and to make it even the deity itself (God Omniscient).

With the question of Truth we find Nietzsche quite as ready to uphold his thesis as with all other questions. He frankly declares that "the criterion of truth lies in the enhancement of the feeling of power" (Aph. 534), and thus stands in diametrical opposition to Spencer, who makes constraint or inability the criterion of truth. (See _Principles of Psychology,_ new edition, chapter ix.... "the unconceivableness of its negation is the ultimate test of the truth of a proposition.")

However paradoxical Nietzsche's view may seem, we shall find that it is actually substantiated by experience; for the activity of our senses certainly convinces us more or less according to the degree to which it is provoked. Thus, if we walked for long round a completely dark room, and everything yielded, however slightly, to our touch, we should remain quite unconvinced that we were in a room at all, more particularly if--to suppose a still more impossible case--the floor yielded too. What provokes great activity in the bulbs of our fingers, then, likewise generates the sensation of truth.

From this Nietzsche proceeds to argue that what provokes the strongest sentiments in ourselves is also true to us, and, from the standpoint of thought, "that which gives thought the greatest sensation of strength" (Aph. 533).

The provocation of intense emotion, and therefore the provocation of that state in which the body is above the normal in power, thus becomes the index to truth; and it is a very remarkable thing that two prominent English thinkers should, at the very end of their careers, have practically admitted this, despite the fact that all their philosophical productions had been based upon a completely different belief. I refer, of course, to Spencer and Buckle, who both upheld the view that in a system of thought the emotional factor is of the highest importance.

It follows from all this, that lies and false doctrines may quite conceivably prove to be even more preservative to species than truth itself, and although this is a view we have already encountered in the opening aphorisms of _Beyond Good and Evil,_ in Aph, 538 this volume we find it further elucidated by Nietzsche's useful demonstration of the fact that "the easier way of thinking always triumphs over the more difficult way"; and that logic, inasmuch as it facilitated classification and orderly thought, ultimately "got to act like truths."

Before leaving Part I., with which it would be impossible to deal in full, a word or two ought to be said in regard to Nietzsche's views concerning the belief in "cause and effect." In the _Genealogy of Morals_ (1st Essay, Aph. 13), we have already read a forecast of our author's more elaborate opinions on this question, and the aphorism in question might be read with advantage in conjunction with the discussion on the subject found in this book (Aphs. 545-555).

The whole of Nietzsche's criticism, however, resolves itself into this, that the doctrine of causality begins with an unnecessary duplication of all that happens. Language, and its origin among a people uneducated in thoughts and concepts, is at the root of this scientific superstition, and Nietzsche traces its evolution from the primeval and savage desire always to find a "doer" behind every deed: to find some one who is responsible and who, being known, thus modifies the unfamiliarity of the deed which requires explaining. "The so-called instinct of causality [of which Kant speaks with so much assurance] is nothing more than the fear of the unfamiliar."

In Aph. 585 (A), we have a very coherent and therefore valuable exposition of much that may still seem obscure in Nietzsche's standpoint, and we might almost regard this aphorism as the key to the epistemology of the Will to Power. When we find the "will to truth" defined merely as "the longing for a stable world," we are in possession of the very leitmotiv of Nietzsche's thought throughout Part I., and most of what follows is clearly but an elaboration of this thought.

In Part II. Nietzsche reveals himself as utterly opposed to all mechanistic and materialistic interpretations of the Universe. He exalts the spirit and repudiates the idea that mere pressure from without--naked environment--is to be held responsible (and often guilty!) for all that materialistic science would lay at its door. Darwin again comes in for a good deal of sharp criticism; and, to those who are familiar with the nature of Nietzsche's disagreement with this naturalist, such aphorisms as Nos. 643, 647, 649, 651, 684, 685, will be of special interest. There is one question of great moment, which all Nietzsche's perfectly sincere and profoundly serious deprecation of the Darwinian standpoint ought to bring home to all Englishmen who have perhaps too eagerly endorsed the conclusions of their own British school of organic evolution, and that is, to what extent were Malthus, and afterwards his disciple Darwin, perhaps influenced in their analysis of nature by preconceived notions drawn from the state of high pressure which

prevailed in the thickly-populated and industrial country in which they both lived?

It is difficult to defend Darwin from the fundamental attack which Nietzsche directs at the very root of his teaching, and which turns upon the question of the motive of all Life's struggle. To assume that the motive is always a "struggle for existence" presupposes the constant presence of two conditions--want and over-population,--an assumption which is absolutely non-proven, and it likewise lends a peculiarly ignoble and cowardly colouring to the whole of organic life, which not only remains unsubstantiated in fact, but which the struggle for power completely escapes. In Part III., which, throughout, is pretty plain sailing, Aphorism 786 contains perhaps the most important statements. Here morality is shown to be merely an instrument, but this time it is the instrument of the gregarious will to power. In the last paragraph of this aphorism Nietzsche shows himself quite antagonistic to Determinism, because of its intimate relation to, and its origin in, a mechanistic interpretation of the Universe. But we should always remember that, inasmuch as Nietzsche would distribute beliefs, just as others distribute bounties--that is to say, according to the needs of those whom he has in view, we must never take for granted that a belief which he deprecates for one class of man ought necessarily, according to him, to be denied another class.

Hard as it undoubtedly is to bear this in mind, we should remember that his appeal is almost without interruption made to higher men, and that doctrines and creeds which he condemns for them he would necessarily exalt in the case of people who were differently situated and otherwise constituted. Christianity is a case in point (see _Will to Power,_ vol. i. Aph. 132).

We now come to Part IV., which is possibly the most important part of all, seeing that it treats of those questions which may be regarded as Nietzsche's most constant concern from the time when he wrote his first book.

The world as we now see and know it, with all that it contains which is beautiful, indifferent, or ugly, from a human standpoint, is, according to Nietzsche, the creation of our own valuing minds. Perhaps only a few people have had a hand in shaping this world of values. Maybe their number could be counted on the fingers of two hands; but still, what Nietzsche insists upon is, that it is human in its origin. Our whole outlook, everything that gives us joy or pain, must at one time or other have been valued for us, and in persisting in these valuations we, as the acclimatised herd, are indebted to our artists, to our higher men, to all those in history, who at some time or other have dared to stand up and to declare emphatically that _this_ was ugly and that _that_ was beautiful, and to fight, and if necessary to die, for their opinion.

Religion, morality, and philosophy, while they all aim at so-called universal Truth, tend to depreciate the value of life in the eyes of exceptional men. Though they establish the "beautiful" for the general stock, and in that way enhance the value of life for that stock, they contradict higher men's values, and, by so doing, destroy their innocent faith in the world. For the problem here is not, what value is true?--but, what value is most conducive to the highest form of human life on earth?

Nietzsche would fain throw all the burden of valuing upon the Dionysian artist him who speaks about this world out of the love and plenitude of power that is in his own breast, him who, from the very health that is within him, cannot look out upon life without transfiguring it, hallowing it, blessing it, and making it appear better, bigger, and more beautiful. And, in this view, Nietzsche is quite consistent; for, if we must accept his conclusion that our values are determined for us by our higher men, then it becomes of the highest importance that these valuers should be so constituted that their values may be a boon and not a bane to the rest of humanity.

Alas! only too often, and especially in the nineteenth century, have men who lacked this Dionysian spirit stood up and valued the world; and it is against these that Nietzsche protests. It is the bad air they have spread which he would fain dispel.

An to what art means to the artist himself, apart from its actual effect on the world, Nietzsche would say that it is a manner of discharging his will to power. The artist tries to stamp his opinion of what is desirable, and of what is beautiful or ugly, upon his contemporaries and the future; it is in this valuing that his impulse to prevail finds its highest expression. Hence the instinctive economy of artists in sex matters--that is to say, in precisely that quarter whither other men go when their impulse to prevail urges them to action. Nietzsche did not of course deny the sensual nature of artists (Aph. 815); all he wished to make plain was this, that an artist who was not moderate, _in eroticis,_ while engaged upon his task, was open to the strongest suspicion.

In the Fourth Book Nietzsche is really at his very best. Here, while discussing questions such as "The Order of Rank," he is so thoroughly in his exclusive sphere, that practically every line, even if it were isolated and taken bodily from the context, would bear the unmistakable character of its author. The thought expressed in Aphorism 871 reveals a standpoint as new as it is necessary. So used have we become to the practice of writing and legislating for a mass, that we have forgotten the rule that prevails even in

our own navy--that the speed of a fleet is measured by its slowest vessel.

On the same principle, seeing that all our philosophies and moralities have hitherto been directed at a mass and at a mob, we find that their elevation must of necessity be decided by the lowest of mankind. Thus all passions are banned, because base men do not know how to enlist them in their service. Men who are masters of themselves and of others, men who understand the management and privilege of passion, become the most despised of creatures in such systems of thought, because they are confounded with the vicious and licentious; and the speed of mankind's elevation thus gets to be determined by humanity's slowest vessels.

Aphorisms 881, 882, 886 fully elucidate the above considerations, while in 912, 916, 943, and 951 we have plans of a constructive teaching which the remainder of Part I. elaborates.

And now, following Nietzsche carefully through Part II. (Dionysus), what is the inevitable conclusion of all we have read? This analysis of the world's collective values and their ascription to a certain "will to power" may now seem to many but an exhaustive attempt at a new system of nomenclature, and little else. As a matter or fact it is very much more than this. By mean? of it Nietzsche wishes to show mankind how much has lain, and how much still lies, in man's power By laying his finger on everything and declaring to man that it was human will that created it. Nietzsche wished to give man the courage of this will, and a clean conscience in exercising it. For it was precisely this very will to power which had been most hated and most maligned by everybody up to Nietzsche's time.

Long enough, prompted by the fear of attributing any one of his happiest thoughts to this hated fundamental will, had man ascribed all his valuations and all his most sublime inspirations to something outside himself,--whether this something were a God, a principle, or the concept Truth. But Nietzsche's desire was to show man how human, all too human, have been the values that have appeared heretofore; he wished to prove, that to the rare sculptors of values, the world, despite its past, is still an open field of yielding clay, and in pointing to what the will to power has done until now, Nietzsche suggests to these coming sculptors what might still be done, provided they fear nothing, and have that innocence and that profound faith in the fundamental will which others hitherto have had in God, Natural Laws, Truth, and other euphemistic fictions.

The doctrine of Eternal Recurrence, to which Nietzsche attached so much importance that it may be regarded almost as the inspiration which led to his great work, _Thus Spake Zarathustra,_ ought to be understood in the light of a purely disciplinary and chastening creed. In one of his posthumous works we find Nietzsche saying: "The question which thou shalt have to answer before every deed that thou doest;--is this such a deed as I am prepared to perform an incalculable number of times,--is the best ballast." Thus it is obvious that, feeling the need of something in his teaching which would replace the metaphysics of former beliefs, he applied the doctrine of Eternal Recurrence to this end. Seeing, however, that even among Nietzscheans themselves there is considerable doubt concerning the actual value of the doctrine as a ruling belief, it does not seem necessary to enter here into the scientific justification which he claims for it. Suffice it to say that, as knowledge stands at present, the statement that the world will recur eternally in small things as in great, is still a somewhat daring conjecture--a conjecture, however, which would have been entirely warrantable if its disciplinary value had been commensurate with its daring.

ANTHONY M. LUDOVICI.

THIRD BOOK.

THE PRINCIPLES OF A NEW VALUATION.

I.

THE WILL TO POWER IN SCIENCE.

(a) The Method of Investigation.

466.

The distinguishing feature of our nineteenth century is not the triumph of _science,_ but the triumph of the scientific _method_ over science.

467.

The history of scientific methods was regarded by Auguste Comte almost as philosophy itself.

468.

The great _Methodologists:_ Aristotle, Bacon, Descartes, Auguste Comte.

469.

The most valuable knowledge is always discovered last: but the most valuable knowledge consists of _methods._

All methods, all the hypotheses on which the science of our day depends, were treated with the profoundest contempt for centuries: on their account a man used to be banished from the society of _respectable_ people--he was held to be an "_enemy of God,_" a reviler of the highest ideal, a madman.

We had the whole _pathos_ of mankind against us,--our notion of what "truth" ought to be, of what the service of truth ought to be, our objectivity, our method, our calm, cautious and distrustful manner were altogether _despicable...._ At bottom, that which has kept men back most, is an æsthetic taste: they believed in the picturesque effect of truth; what they demanded of the scientist was, that he should make a strong appeal to their imagination.

From the above, it would almost seem as if the very _reverse_ had been achieved, as if a sudden _jump_ had been made: as a matter of fact, the schooling which the moral hyperboles afforded, gradually prepared the way for that _milder form of pathos_ which at last became incarnate in the scientific man....

Conscientiousness in small things, the self-control of the religious man, was a preparatory school for the scientific character, as was also, in a very pre-eminent sense, the attitude of mind which makes a man _take problems seriously,_ irrespective of what personal advantage he may derive from them....

_(b)_ The Starting-point of Epistemology.

470.

Profound disinclination to halt once and for all at any collective view of the world. The charm of the opposite point of view: the refusal to relinquish the stimulus residing in the enigmatical.

471.

The hypothesis that, at bottom, things proceed in such a moral fashion that _human reason must be right,_ is a mere piece of good-natured and simple-minded trustfulness, the result of the belief in Divine truthfulness--God regarded as the Creator of all things.--These concepts are our inheritance from a former existence in a Beyond.

472.

The contradiction of the so-called "facts of consciousness." Observation a thousand times more difficult, error is perhaps the absolute _condition_ of observation.

473.

The intellect cannot criticise itself, simply because it can be compared with no other kind of intellect, and also because its ability to know would only reveal itself in the presence of "actual reality"; that is to say, because, in order to criticise the intellect, we should have to be higher creatures with "absolute knowledge." This would presuppose the existence of _something,_ a "thing-in-itself," apart from all the perspective kinds of observation and senso-spiritual perception. But the psychological origin of the belief in _things,_ forbids our speaking of "things in themselves."

474.

The idea that a sort of adequate relation exists between _subject_ and _object,_ that the object is something which _when seen from inside_ would be a subject, is a well-meant invention which, I believe, has seen its best days. The measure of that which we are conscious of, is perforce entirely dependent upon the coarse utility of the function of consciousness: how could this little garret-prospect of consciousness warrant our asserting anything in regard to "subject" and "object," which would bear any relation to reality!

475.

Criticism of modern philosophy: erroneous starting-point, as if there were such things as "facts of consciousness"--and no _phenomenalism_ in _introspection._

476.

"Consciousness"--to what extent is the idea which is thought of, the idea of will, or the idea of a feeling (_which is known by us alone_), quite superficial? Our _inner_ world is also "appearance."

477.

I am convinced of the phenomenalism of the _inner_ world also: everything that reaches our consciousness is utterly and completely adjusted, simplified, schematised, interpreted, the _actual_ process of inner "perception," the _relation of causes_ between thoughts, feelings, desires, between subject and object, is absolutely concealed from us, and may be purely imaginary. This "_inner_ world of appearance" is treated with precisely the same forms and procedures as the "outer" world. We never come across a single "fact": pleasure and pain are more recently evolved intellectual phenomena....

Causality evades us; to assume the existence of an immediate causal relation between thoughts, as Logic does, is the result of the coarsest and most clumsy observation. There are _all sorts of passions_ that may intervene between two thoughts: but the interaction is too rapid--that is why we _fail to recognise_ them, that is why we actually _deny_ their existence....

"Thinking," as the epistemologists understand _\r_ it, never takes place at all: it is an absolutely gratuitous fabrication, arrived at by selecting one element from the process and by eliminating all the rest--an artificial adjustment for the purpose of the understanding....

The "mind," _something that thinks_: at times, even, "the mind absolute and pure"--this concept is an evolved and second result of false introspection, which believes in "thinking": in the first place an act is imagined here which does not really occur at all, _i.e._ "thinking"; and, _secondly,_ a subject-substratum is imagined in which every process of this thinking has its origin, and nothing else--that is to say, _both the action and the agent are fanciful._

478.

Phenomenalism must not be sought in the wrong quarter: nothing is more phenomenal, or, to be more precise, nothing is so much _deception,_ as this inner world, which we observe with the "inner sense."

Our belief that the will is a cause was so great, that, according to our personal experiences in general, we projected a cause into all phenomena (_i.e._ a certain motive is posited as the cause of all phenomena).

We believe that the thoughts which follow one upon the other in our minds are linked by some sort of causal relation: the logician, more especially, who actually speaks of a host of facts which have never once been seen in reality, has grown accustomed to the prejudice that thoughts _are the cause_ of thoughts.

We believe--and even our philosophers believe it still--that pleasure and pain are the causes of reactions, that the very purpose of pleasure and pain is to occasion reactions. For hundreds of years, pleasure and pain have been represented as the _motives_ for every action. Upon reflection, however, we are bound to concede that everything would have proceeded in exactly the same way, according to precisely the same sequence of cause and effect, if the states "pleasure" and "pain" had been entirely absent; and that we are simply deceived when we believe that they actually cause anything:--they are the _attendant phenomena,_ and they have quite a different purpose from that of provoking reactions; they are in themselves effects involved in the process of reaction which takes place.

In short: Everything that becomes conscious is a final phenomenon, a conclusion--and is the cause of nothing; all succession of phenomena in consciousness is absolutely atomistic.--And we tried to understand the universe from the _opposite_ point of view--as if nothing were effective or real, save thinking, feeling, willing! ...

479.

The phenomenalism of the "inner world!" A chronological inversion takes place, so that the cause reaches consciousness as the effect.--We know that pain is projected into a certain part of the body although it is not really situated there; we have learnt that all sensations which were ingenuously supposed to be conditioned by the outer world are, as a matter of fact, conditioned by the inner world: that the real action of the outer world never takes place in a way of which we can become conscious.... That fragment of the outer world of which we become conscious, is born after the effect produced by the outer world has been recorded, and is subsequently interpreted as the "cause" of that effect....

In the phenomenalism of the "inner world," the chronological order of cause and effect is inverted. The fundamental fact of "inner experience" is, that the cause is imagined after the effect has been recorded.... The same holds good of the sequence of thoughts: we seek for the reason of a thought, before it has reached our consciousness; and then the reason reaches consciousness first, whereupon follows its effect. All our dreams are the interpretation of our collective feelings with the view of discovering the possible causes of the latter; and the process is such that a condition only becomes conscious, when the supposed causal link has reached consciousness.[1]

The whole of "inner experience" is founded on this: that a cause is sought and imagined which accounts for a certain irritation in our nerve-centres, and that it is only the cause which is found in this way which reaches consciousness; this cause may have absolutely nothing to do with the real cause--it is a sort of groping assisted by former "inner experiences," that is to say, by memory. The memory, however, retains the habit of old interpretations,--that is to say, of erroneous causality,--so that "inner experience" comprises in itself all the results of former erroneous fabrications of causes. Our "outside world," as we conceive it every instant, is indissolubly bound up with the old error of cause: we interpret by means of the schematism of "the thing," etc.

"Inner experience" only enters consciousness when it has found a language which the individual can _understand_--that is to say, a translation of a certain condition into conditions with which he is _familiar;_ "understand" means simply this: to be able to express something new in the terms of something old or familiar. For instance, "I feel unwell"--a judgment of this sort presupposes a _very great and recent neutrality on the part of the observer:_ the simple man always says, "This and that make me feel unwell,"--he begins to be clear concerning his indisposition only after he has discovered a reason for it.... This is what I call _a lack of philological_ knowledge; to be able to read a text, _as such,_ without reading an interpretation into it, is the latest form of "inner experience,"--it is perhaps a barely possible form....

[Footnote 1: When in our dream we hear a bell ringing, or a tapping at our door, we scarcely ever wake before having already accounted for the sound, in the terms of the dream-world we were in.--TR.]

480.

There are no such things as "mind," reason, thought, consciousness, soul, will, or truth: they all belong to fiction, and can serve no purpose. It is not a question of "subject and object," but of a particular species of animal which can prosper only by means of a certain _exactness,_ or, better still, _regularity_ in recording its perceptions (in order that experience may be capitalised)....

Knowledge works as an _instrument_ of power. It is therefore obvious that it increases with each advance of power....

The purpose of knowledge: in this case, as in the case of "good" or "beautiful," the concept must be regarded strictly and narrowly from an anthropocentric and biological standpoint. In order that a particular species may maintain and increase its power, its conception of reality must contain enough which is calculable and constant to allow of its formulating a scheme of conduct. _The utility of preservation_--and _not_ some abstract or theoretical need to eschew deception--stands as the motive force behind the development of the organs of knowledge; ... they evolve in such a way that their observations may suffice for our preservation. In other words, the _measure_ of the desire for knowledge depends upon the extent to which _the Will to Power_ grows in a certain species: a species gets a grasp of a given amount of reality, _in order to master it, in order to enlist that amount in its service._

(c) The Belief in the "Ego." Subject.

481.

In opposition to Positivism, which halts at phenomena and says, "These are only _facts_ and nothing more," I would say: No, facts are precisely what is lacking, all that exists consists of _interpretations._ We cannot establish any fact "in itself": it may even be nonsense to desire to do such a thing. "Everything is _subjective,_" ye say: but that in itself is _interpretation._ The subject is nothing given, but something superimposed by fancy, something introduced behind.--Is it necessary to set an interpreter behind the interpretation already to hand? Even that would be fantasy, hypothesis.

To the extent to which knowledge has any sense at all, the world is knowable: but it may be interpreted _differently,_ it has not one sense behind it, but hundreds of senses.--"Perspectivity."

It is our needs that _interpret the world_; our instincts and their impulses for and against. Every instinct is a sort of thirst for power; each has its point of view, which it would fain impose upon all the other instincts as their norm.

482.

Where our ignorance really begins, at that point from which we can see no further, we set a word; for instance, the word "I," the word "do," the word "suffer"--these concepts may be the horizon lines of our knowledge, but they are not "truths."

483.

Owing to the phenomenon "thought," the ego is taken for granted; but up to the present everybody believed, like the people, that there was something unconditionally certain in the notion "I think," and that by analogy with our understanding of all other causal reactions this "I" was the given _cause_ of the thinking. However customary and indispensable this fiction may have become now, this fact proves nothing against the imaginary nature of its origin; it might be a life-preserving belief and _still_ be _false._

484.

"Something is thought, therefore there is something that thinks": this is what Descartes' argument amounts to. But this is tantamount to considering our belief in the notion "_substance_" as an "_a priori_" truth:--that there must be something "that thinks" when we think, is merely a formulation of a grammatical custom which sets an agent to every action. In short, a metaphysico-logical postulate is already put forward here--and it is not merely _an ascertainment of fact...._ On Descartes' lines nothing absolutely certain is attained, but only the fact of a very powerful faith.

If the proposition be reduced to "Something is thought, therefore there are thoughts," the result is mere tautology; and precisely the one factor which is in question, the "_reality_ of thought," is not touched upon,--so that, in this form, the apparitional character of thought cannot be denied. What Descartes _wanted_ to prove was, that thought not only had _apparent reality,_ but absolute reality.

485.

The concept _substance_ is an outcome of the concept _subject,_ and not conversely! If we surrender the concept soul, the subject, the very conditions for the concept "substance" are lacking. _Degrees of Being_ are obtained, but Being is lost.

Criticism of "_reality_": what does a _"plus or minus of reality"_ lead to, the gradation of Being in which we believe?

The degree of our feeling of _life_ and _power_ (the logic and relationship of past life) presents us with the measure of "Being," "reality," "non-appearance."

Subject i this is the term we apply to our belief in an _entity_ underlying all the different moments of the most intense sensations of reality; we regard this belief as the effect of a cause,--and we believe in our belief to such an extent that, on its account alone, we imagine "truth," "reality," "substantiality."--a "Subject" is the fiction which would fain make us believe that several similar states were the effect of one substratum: but we it was who first _created_ the "similarity" of these states; the similising and adjusting of them is the _fact--not_ their similarity (on the contrary, this ought rather to be denied).

486.

One would have to know what _Being_ is, in order to be able to _decide_ whether this or that is real (for instance, "the facts of consciousness"); it would also be necessary to know what _certainty_ and _knowledge_ are, and so forth.--But, as we do _not_ know these things, a criticism of the faculty of knowledge is nonsensical: how is it possible for an instrument to criticise itself, when it is itself that exercises the critical faculty. It cannot even define itself!

487.

Should not all philosophy ultimately disclose the first principles on which the reasoning processes depend?--that is to say, our _belief_ in the "ego" as a substance, as the only reality according to which, alone, we are able to ascribe reality to things? The oldest realism at length comes to light, simultaneously with man's recognition of the fact that his whole religious history is no more than a history of soul-superstitions. _Here there is a barrier;_ our very thinking, itself, involves that belief (with its distinctions--substance, accident, action, agent, etc.); to abandon it would mean to cease from being able to think.

But that a belief, however useful it may be for the preservation of a species, has nothing to do with the truth, may be seen from the fact that we _must_ believe in time, space, and motion, without feeling ourselves compelled to regard them as absolute realities.

488.

_The psychological origin of our belief in reason.--_The ideas "reality," "Being," are derived from our _subject-_feeling.

"Subject," interpreted through ourselves so that the ego may stand as substance, as the cause of action, as the _agent._

The metaphysico-logical postulates, the belief in substance, accident, attribute, etc. etc., draws its convincing character from our habit of regarding all our actions as the result of our will: so that the ego, as substance, does not vanish in the multiplicity of changes.--_But there is no such thing as will._ We have no categories which allow us to separate a "world as thing-in-itself," from "a world of appearance." All our _categories of reason_ have a sensual origin: they are deductions from the empirical world. "The soul," "the ego"--the history of these concepts shows that here, also, the oldest distinction ("_spiritus_," "life") obtains....

If there is nothing material, then there can be nothing immaterial. The concept no longer _means_ anything.

No subject-"atoms." The sphere of a subject _increasing_ or _diminishing_ unremittingly, the centre of the system continually _displacing_ itself, in the event of the system no longer being able to organise the appropriated mass, it divides into two. On the other hand, it is able, without destroying it, to transform a weaker subject into one of its own functionaries, and, to a certain extent, to compose a new entity with it. Not a "substance," but rather something which in itself strives after greater strength; and which wishes to "preserve" itself only indirectly (it wishes to _surpass_ itself).

489.

Everything that reaches consciousness as an entity is already enormously complicated: we never have anything more than the _semblance of an entity._

The phenomenon of the _body_ is the richer, more distinct, and more tangible phenomenon: it should be methodically drawn to the front, and no mention should be made of its ultimate significance.

490.

The assumption of a _single subject_ is perhaps not necessary, it may be equally permissible to assume a plurality of subjects, whose interaction and struggle lie at the bottom of our thought and our consciousness in general. A sort of _aristocracy_ of "cells" in which the ruling power is vested? Of course an aristocracy of equals, who are accustomed to ruling co-operatively, and understand how to command?

My hypotheses. The subject as a plurality. Pain intellectual and dependent upon the judgment harmful, projected. The effect always "unconscious": the inferred and imagined cause is projected, it _follows_ the event. Pleasure is a form of pain. The only kind of power that exists is of the same nature as the power of will: a commanding of other subjects which thereupon alter themselves. The unremitting transientness and volatility of the subject. "Mortal soul." _Number_ as perspective form.

491.

The belief in the body is more fundamental than the belief in the soul: the latter arose from the unscientific observation of the agonies of the body. (Something which leaves it. The belief in the _truth of dreams_)

492.

The body and physiology the starting-point: why?--We obtain a correct image of the nature of our subject-entity, that is to say, as a number of regents at the head of a community (not as "souls" or as "life-forces") as also of the dependence of these regents upon their subjects, and upon the conditions of a hierarchy, and of the division of labour, as the means ensuring the existence of the part and the whole. We also obtain a correct image of the way in which the living entities continually come into being and expire, and we see how eternity cannot belong to the "subject"; we realise that the struggle finds expression in obeying as well as in commanding, and that a fluctuating definition of the limits of power is a factor of life. The comparative _ignorance_ in which the ruler is kept, of the individual performances and even disturbances taking place in the community, also belong to the conditions under which government may be carried on. In short, we obtain a valuation even of _want-of-knowledge,_ of seeing-things-generally-as-a-whole, of simplification, of falsification, and of perspective. What is most important, however, is, that we regard the ruler and his subjects as of the _same kind,_ all feeling, willing, thinking--and that wherever we see or suspect movement in a body, we conclude that there is co-operative-subjective and invisible life. Movement as a symbol for the eye; it denotes that something has been felt, willed, thought.

The danger of directly questioning the subject _concerning_ the subject, and all spiritual self-reflection, consists in this, that it might be a necessary condition of its activity to interpret itself _erroneously._ That is why we appeal to the body and lay the evidence of sharpened senses aside: or we try and see whether the subjects themselves cannot enter into communication with us.

_(d)_ Biology of the Instinct of Knowledge. Perspectivity.

493.

Truth is that kind of error without which a certain species of living being cannot exist. The value for _Life_ is ultimately decisive.

494.

It is unlikely that our "knowledge" extends farther than is exactly necessary for our self-preservation. Morphology shows us how the senses and the nerves as well as the brain evolve in proportion as the difficulties of acquiring sustenance increase.

495.

If the morality of "Thou shalt not lie" be refuted, the sense for truth will then have to justify itself before another tribunal--as a means to the preservation of man, _as Will to Power._

Likewise our love of the beautiful: it is also the _creative will._ Both senses stand side by side; the sense of truth is the means wherewith the power is appropriated to adjust things according to one's taste. The love of adjusting and reforming--a primeval love! We can only _take cognisance_ of a world which we ourselves have _made._

496.

Concerning the multifariousness of knowledge. The tracing of _its_ relation to many other things (or the relation of kind)--how should "knowledge" be of another? The way to know and to investigate is in itself among the conditions of life; that is why the conclusion that there could be no other kind of intellect (for ourselves) than the kind which serves the purpose of our preservation is an excessively hasty one: this _actual_ condition may be only an accidental, not in the least an essential; one.

Our apparatus for acquiring knowledge is not adjusted for knowledge.

497.

The most strongly credited a priori "truths" are, to my mind, mere assumptions pending further investigation; for instance, the law of causation is a belief so thoroughly acquired by practice and so completely assimilated, that to disbelieve in it would mean the ruin of our kind. But is it therefore true? What an extraordinary conclusion! As if truth were proved by the mere fact that man survives!

498.

To what extent is our _intellect_ also a result of the conditions of life?--We should not have it did we not _need_ to have it, and we should not have it _as_ we have it, if we did not need it _as_ we need it--that is to say, if we could live otherwise.

499.

Thinking in a primitive (inorganic) state is to _persevere in forms,_ as in the case of the crystal.--In _our_ thought, the _essential factor_ is the harmonising of the new material with the old schemes (= Procrustes' bed), the _assimilation_ of the unfamiliar.

500.

The perception of the senses projected outwards: "inwards" and "outwards"--does the _body_ command here?

The same equalising and ordering power which rules in the idioplasma, also rules in the incorporation of the outer world: our sensual perceptions are already the _result_ of this process of _adaptation_ and _harmonisation_ in regard to _all_ the past in us; they do not follow directly upon the "impression."

501.

All thought, judgment, perception, regarded as an act of _comparing_[2] has as a first condition the act of _equalising,_ and earlier still the act of _"making equal."_ The process of making equal is the same as the assimilation by the amœba of the nutritive matter it appropriates.

"Memory" late, in so far as the equalising instinct appears to have been _subdued_: the difference is preserved. Memory--a process of classification and collocation; active--who?

[Footnote 2: The German word _vergleichen,_ meaning "to compare," contains the root "equal" _(gleich)_ which cannot be rendered in English. TR.]

502.

In regard to the _memory,_ we must unlearn a great deal: here we meet with the greatest temptation to assume the existence of a "soul," which, irrespective of time, reproduces and recognises again and again, etc. What I have experienced, however, continues to live "in the memory"; I have nothing to do with it when memory "comes," my will is inactive in regard to it, as in the case of the coming and going of a thought. Something happens, of which I become conscious: now something similar comes--who has called it forth? Who has awakened it?

503.

The whole apparatus of knowledge is an abstracting and simplifying apparatus--not directed at knowledge, but at the _appropriation_ of things: "end" and "means" are as remote from the essence of this apparatus as "concepts" are. By the "end" and the "means" a process is appropriated (--a process is _invented_ which may be grasped), but by "_concepts_" one appropriates the "things" which constitute the process.

504.

Consciousness begins outwardly as co-ordination and knowledge of impressions,--at first it is at the point which is remotest from the biological centre of the individual; but it is a process which deepens and which tends to become more and more an inner function, continually approaching nearer to the centre.

505.

Our perceptions, as we understand them--that is to say, the sum of all those perceptions the consciousness whereof was useful and essential to us and to the whole organic processes which preceded us: therefore they do not include all perceptions (for instance, not the electrical ones);--that is to say, we have _senses_ only for a definite selection of perceptions--such perceptions as concern us with a view to our self-preservation. _Consciousness extends so far only as it is useful._ There can be no doubt that all

our sense-perceptions are entirely permeated by valuations (useful or harmful--consequently, pleasant or painful). Every particular colour; besides being a colour, expresses a value to us (although we seldom admit it, or do so only after it has affected us exclusively for a long time, as in the case of convicts in gaol or lunatics). Insects likewise react in different ways to different colours: some like this shade, the others that. Ants are a case in point.

506.

In the beginning _images_ how images originate in the mind must be explained. Then _words,_ applied to images. Finally _concepts,_ possible only when there are words--the assembling of several pictures into a whole which is not for the eye but for the ear (word). The small amount of emotion which the "word" generates,--that is, then, which the view of the similar pictures generates, for which one word is used,--this simple emotion is the common factor, the basis of a concept. That weak feelings should all be regarded as alike, _as the same,_ is the fundamental fact. There is therefore a confusion of two very intimately associated feelings in the _ascertainment_ of these feelings;--but who is it that ascertains? _Faith_ is the very first step in every sensual impression: a sort of yea-saying is the _first_ intellectual activity! A "holding-a-thing-to-be-true" is the beginning. It were our business, therefore, to explain how the "holding-of-a-thing-to-be-true" arose! What sensation lies beneath the comment "true"?

507.

The _valuation_, "I believe that this and that is so," is the essence of "truth." In all valuations, the conditions of _preservation_ and of _growth_ find expression. All our _organs and senses_ of knowledge have been developed only in view of the conditions of preservation and growth. The _trust_ in reason and its categories, the trust in dialectics, and also the _valuation_ of logic, prove only that _experience_ has taught the usefulness of these things to life: not their "truth." The prerequisites of all living things and of their lives is: that there should be a large amount of faith, that it should be possible to pass definite judgments on things, and that _there should be no doubt_ at all concerning all essential values. Thus it is necessary that something should be assumed to be true, _not_ that it _is_ true.

"The _real_ world and the world of _appearance_"-- I trace this contrast to the _relation of values._ We have posited _our_ conditions of existence as the _attributes of being_ in general. Owing to the fact that, in order to prosper, we must be stable in our belief, we developed the idea that the real world was neither a changing nor an evolving one, but a world of _being._

_(e)_ The Origin of Reason and Logic.

508.

Originally there was chaos among our ideas. Those ideas which were able to stand side by side remained over, the greater number perished--and are still perishing.

509.

The kingdom of desires out of which logic grew: the gregarious instinct in the background. The assumption of similar facts is the first condition for "similar souls." _For the purpose of mutual understanding and government._

510.

Concerning the _origin of logic._ The fundamental proneness to _equalise_ things and to _see them equal_, gets to be modified, and kept within bounds, by the consideration of what is useful or harmful--in fact, by considerations of success: it then becomes adapted in suchwise as to be gratified in a milder way, without at the same time denying life or endangering it. This whole process corresponds entirely with that external and mechanical process (which is its symbol) by which the _protoplasm_ continually assimilates, makes equal to itself, what it appropriates, and arranges it according to its own forms and requirements.

511.

Likeness and Similarity.

1. The coarser the organ the more apparent likenesses it sees;

2. The mind _will_ have likeness--that is to say, the identification of one sensual impression with others already experienced: just as the body _assimilates_ inorganic matter.

For the understanding of Logic:--

The will which tends to see likeness everywhere is the will to power--the belief that something is so and so (the essence of a judgment), is the result of a will which _would fain have it_ as similar as possible.

512.

Logic is bound up with the proviso: granted _that identical cases exist_. As a matter of fact, before one can think and conclude in a logical fashion, _this_ condition _must_ first be assumed. That is to say, the will to _logical truth_ cannot be consummated before a fundamental falsification of all phenomena has been assumed. From which it follows that an instinct rules here, which is capable of employing both means: first, falsification; and secondly, the carrying out of its own point of view: logic does not spring from a will to truth.

513.

The inventive force which devised the categories, worked in the service of our need of security, of quick intelligibility, in the form of signs, sounds, and abbreviations.--"Substance," "subject," "object," "Being," "Becoming," are not matters of metaphysical truth. It was the powerful who made the names of things into law, and, among the powerful, it was the greatest artists in abstraction who created the categories.

514.

A moral--that is to say, a method of living which long experience and experiment have tested and proved efficient, at last enters consciousness as a law, as dominant.... And then the whole group of related values and conditions become part of it: it becomes venerable, unassailable, holy, true; a necessary part of its evolution is that its origin should be forgotten.... That is a sign that it has become master. Exactly the same thing might have happened with the categories of reason: the latter, after much groping and many trials, might have proved true through relative usefulness.... A stage was reached when they were grasped as a whole, and when they appealed to consciousness as a whole,--when belief in them was commanded,--that is to say, when they acted as if they commanded.... From that time forward they passed as a priori, as beyond experience, as irrefutable. And, possibly, they may have been the expression of no more than a certain practicality answering the ends of a race and a species,--their usefulness alone is their "truth."

515.

The object is, not "to know," but to schematise,--to impose as much regularity and form upon chaos, as our practical needs require. In the formation of reason, logic, and the categories, it was a need in us that was the determining power: not the need "to know," but to classify, to schematise, for the purpose of intelligibility and calculation. (The adjustment and interpretation of all similar and equal things,--the same process, which every sensual impression undergoes, is the development of reason!) No pre-existing "idea" had anything to do with it: but utility, which teaches us that things can be reckoned with and managed, only when we view them roughly as equal.... _Finality_ in reason is an effect, not a cause: Life degenerates with every other form of reason, although constant attempts are being made to attain to those other forms of reason;--for Life would then become too obscure, too unequal.

The categories are "truths" only in the sense that they are the conditions of our existence, just as Euclid's Space is a conditional "truth." (Between ourselves, as no one will maintain that men are absolutely necessary, reason, as well as Euclid's Space, are seen to be but an idiosyncrasy of one particular species of animals, one idiosyncrasy alone among many others....)

The subjective constraint which prevents one from contradicting here, is a biological constraint: the instinct which makes us see the utility of concluding as we do conclude, is in our blood, we _are_ almost this instinct.... But what simplicity it is to attempt to derive from this fact that we possess an absolute truth! ... The inability to contradict anything is a proof of impotence but not of "truth."

516.

We are not able to affirm and to deny one and the same thing: that is a principle of subjective experience--which is not in the least "necessary," _but only a sign of inability._

If, according to Aristotle, the _principium contradictionis_ is the most certain of all principles; if it is the most ultimate of all, and the basis of every demonstration; if the principle of every other axiom lie within it: then one should analyse it all the more severely, in order to discover how many assumptions _already lie_ at its root. It either assumes something concerning reality and Being, as if these had become known in some other sphere--that is to say, as if it were _impossible_ to ascribe the opposite attributes to it; or the proposition means: that the opposites _should_ not be ascribed to it. In that case, logic would be an imperative, _not_ directed at the knowledge of truth, but at the adjusting and fixing of a world _which must seem true to us._

In short, the question is a debatable one: are the axioms of logic adequate to reality, or are they measures and means by which alone we can, _create_ realities, or the concept "reality"?... In order to affirm the first alternative, however, one would, as we have seen, require a previous knowledge of Being; which is certainly not the case. The proposition therefore contains no _criterion of truth,_ but an _imperative_ concerning that which _should_ pass as true.

Supposing there were no such thing as A identical with itself, as every logical (and mathematical) proposition presupposes, and that A is in itself an _appearance,_ then logic would have a mere world _of appearance_ as its first condition. As a matter of fact, we believe in that proposition, under the influence of an endless empiricism which seems to _confirm_ it every minute. The "thing"--that is the real substratum of A; _our belief in things_ is the first condition of our faith in logic. The A in logic is, like the atom, a reconstruction of the thing.... By not understanding this, and by making logic into a criterion of _real being,_ we are already on the road to the classification of all those hypostases, substance, attribute, object, subject, action, etc., as realities--that is to say, the conception of a metaphysical world or a "real world" (--_this is, however, once more the world of appearance..._).

The primitive acts of thought, affirmation, and negation, the holding of a thing for true, and the holding of a thing for not true,--in so far as they do not only presuppose a mere habit, but the very _right_ to postulate truth or untruth at all,--are already dominated by a belief, _that there is such a thing as knowledge for us,_ and _that judgments can really hit the truth:_ in short, logic never doubts that it is able to pronounce something concerning truth in itself (--that is to say, that to the thing which is in itself true, no opposite attributes _can_ be ascribed).

In this belief there _reigns_ the sensual and coarse prejudice that our sensations teach us _truths_ concerning things,--that I cannot at the same moment of time say of one and the same thing that it is _hard_ and _soft._ (The instinctive proof, "I cannot have two opposite sensations at once," is quite _coarse_ and _false_.)

That all contradiction in concepts should be forbidden, is the result of a belief, that we _are able_ to form concepts, that a concept not only characterises but also _holds_ the essence of a thing.... As a matter of fact, logic (like geometry and arithmetic) only holds good of _assumed existences which we have created._ Logic is _the attempt on our part to understand the actual world according to a scheme of Being devised by ourselves; or, more exactly, it is our attempt at making the actual world more calculable and more susceptible to formulation, for our own purposes...._

517.

In order to be able to think and to draw conclusions, it is necessary to _acknowledge that which exists:_ logic only deals with formulæ for things which are constant. That is why this acknowledgment would not in the least prove reality: "that which is" is part of our optics. The ego regarded as Being (not affected by either Becoming or evolution).

The _assumed world_ of subject, substance, reason, etc., is necessary, an adjusting, simplifying falsifying, artificially-separating power resides in us. "Truth" is the will to be master over the manifold sensations that reach consciousness; it is the will to _classify_ phenomena according to definite categories. In this way we start out with a belief in the "true nature" of things (we regard phenomena as real).

The character of the world in the process of Becoming _is not susceptible of formulation;_ it is "false" and "contradicts itself." _Knowledge_ and the process of _evolution_ exclude each other. _Consequently,_ knowledge must be something else: it must be preceded by a will to make things knowable, a kind of Becoming in itself must create the _illusion_ of _Being._

518.

If our "ego" is the only form of Being, according to which we make and understand all Being: very good! In that case it were very proper to doubt whether an _illusion_ of perspective were not active here--the apparent unity which everything assumes in our eyes on the horizon-line. Appealing to the body for our guidance, we are confronted by such appalling manifoldness, that for the sake of

method it is allowable to use that phenomenon which is _richer_ and more easily studied as a clue to the understanding of the poorer phenomenon.

Finally: admitting that all is Becoming, _knowledge is only possible when based on a belief in Being._

519.

If there is "only one form of Being, the ego," and all other forms of Being are made in its own image,--if, in short, the belief in the "ego," together with the belief in logic, stands and falls with the metaphysical truth of the categories of reason: if, in addition, the "ego" is shown to be something that is _evolving: then----_

520.

The continual transitions that occur, forbid our speaking of the "individual," etc.; the "number" of beings itself fluctuates. We should know nothing of time or of movement, if, in a rough way, we did not believe we saw things "standing still" behind or in front of things moving. We should also know just as little about cause and effect, and without the erroneous idea of "empty space" we should never have arrived at the concept of space at all. The principle of identity is based on the "fact of appearance" that there are some things alike. Strictly speaking, it would not be possible to "understand" and "know" an evolving world; something which is called "knowledge" exists only in so far as the "understanding" and "knowing" intellect already finds an adjusted and rough world to hand, fashioned out of a host of mere appearances, but become fixed _to_ the extent in which this kind of appearance has helped to preserve life; only to this extent is "knowledge" possible--that is to say, as a measuring of earlier and more recent errors by one another.

521.

Concerning logical appearance.--The concept "individual" and the concept "species" are equally false and only apparent. "_Species_" only expresses the fact that an abundance of similar creatures come forth at the same time, and that the speed of their further growth and of their further transformation has been made almost imperceptible for a long time: so that the actual and trivial changes and increase of growth are of no account at all (--a stage of evolution in which the process of evolving is not visible, so that, not only does a state of equilibrium _seem_ to have been reached, but the road is also made clear for the error of supposing _that an actual goal has been reached_--and that evolution had a goal...).

The form seems to be something enduring, and therefore valuable; but the form was invented merely by ourselves; and however often "the same form is attained," it does not signify that it _is the same form,--because something new always appears_; and we alone, who compare, reckon the new with the old, in so far as it resembles the latter, and embody the two in the unity of "form." As if a _type_ had to be reached and were actually intended by the formative processes.

Form, species, law, idea, purpose--the same fault is made in respect of all these concepts, namely, that of giving a false realism to a piece of fiction: as if all phenomena were infused with some sort of obedient spirit--an artificial distinction is here made between that _which_ acts and that _which_ guides action (but both these things are only fixed in order to agree with our metaphysico-logical dogma: they are not "facts").

We should not interpret this _constraint_ in ourselves, to imagine concepts, species, forms, purposes, and laws ("_a world of identical cases_") as if we were in a position to construct a _real world_; but as a constraint to adjust a world by means of which _our existence_ will be ensured: we thereby create a world which is determinable, simplified, comprehensible, etc., for us.

The very same constraint is active in _the functions of the senses_ which support the reason--by means of simplification, coarsening, accentuation, and interpretation; whereon all "recognition," all the ability of making one's self intelligible rests. Our _needs_ have made our senses so precise, that the "same world of appearance" always returns, and has thus acquired the semblance of _reality._

Our subjective constraint to have faith in logic, is expressive only of the fact that long before logic itself became conscious in us, we did nothing _save introduce its postulates into the nature of things:_ now we find ourselves in their presence,--we can no longer help it,--and now we would fain believe that this constraint is a guarantee of "truth." We it was who created the "thing," the "same thing," the subject, the attribute, the action, the object, the substance, and the form, after we had carried the process of equalising, coarsening, and simplifying as far as possible. The world _seems_ logical to us, because we have already made it logical.

522.

Fundamental solution.--We believe in reason: this is, however, the philosophy of colourless _concepts._ Language is built upon the most _naïf_ prejudices.

Now we read discord and problems into things, because we are able to _think only_ in the form of language--we also believe in the "eternal truth" of "wisdom" (for instance, subject, attribute, etc.).

We cease from thinking if we do not wish to think under the control of language; the most we can do is to attain to an attitude of doubt concerning the question whether the boundary here really is a boundary.

Rational thought is a process of interpreting according to a scheme which we cannot reject.

(_f_) Consciousness.

523.

There is no greater error than that of making psychical and physical phenomena the two faces, the two manifestations of the same substance. By this means nothing is explained: the concept _"substance"_ is utterly useless as a means of explanation. _Consciousness_ may be regarded as secondary, almost an indifferent and superfluous thing, probably destined to disappear and to be superseded by perfect automatism--

When we observe mental phenomena we may be likened to the deaf and dumb who divine the spoken word, which they do not hear, from the movements of the speaker's lips. From the appearance of the inner mind we draw conclusions concerning invisible and other phenomena, which we could ascertain if our powers of observation were adequate for the purpose.

For this inner world we have no finer organs, and that is why a _complexity which is thousandfold_ reaches our consciousness as a simple entity, and we invent a process of causation in it, despite the fact that we can perceive no cause either of the movement or of the change--the sequence of thoughts and feelings is nothing more than their becoming visible to consciousness. That this sequence has anything to do with a chain of causes is not worthy of belief: consciousness never communicates an example of cause and effect to us.

524.

The part "consciousness" plays,--It is essential that one should not mistake the part that "consciousness plays" it is our _relation to the outer world; it was the outer world that developed it._ On the other hand, the _direction_--that is to say, the care and cautiousness which is concerned with the inter-relation of the bodily functions, does _not_ enter into our consciousness any more than does the _storing activity_ of the intellect: that there is a superior controlling force at work in these things cannot be doubted--a sort of directing committee, in which the various _leading desires_ make their votes and their power felt. "Pleasure" and "pain" are indications which reach us from this sphere: as are also _acts of will_ and _ideas._

In short: That which becomes conscious has causal relations which are completely and absolutely concealed from our knowledge--the sequence of thoughts, feelings, and ideas, in consciousness, does not signify that the order in which they come is a causal order: it is _so apparently,_ however, in the highest degree. We have _based_ the whole of our notion of _intellect, reason, logic,_ etc., upon this _apparent truth_ (all these things do not exist: they are imaginary syntheses and entities), and we then projected the latter into and _behind_ all things!

As a rule _consciousness_ itself is understood to be the general sensorium and highest ruling centre; albeit, it is only a _means of communication:_ it was developed by intercourse, and with a view to the interests of intercourse.... "Intercourse" is understood, here, as "relation," and is intended to cover the action of the outer world upon us and our necessary response to it, as also our actual influence _upon_ the outer world. It is _not_ the conducting force, but an _organ of the latter._

525.

My principle, compressed into a formula which savours of antiquity, of Christianity, Scholasticism, and other kinds of musk: in the concept, "God is _spirit,_" God as perfection is "_denied...._"

526.

Wherever people have observed a certain unity in the grouping of things, _spirit_ has always been regarded as the cause of this co-ordination: an assumption for which reasons are entirely lacking. Why should the idea of a complex fact be one of the conditions of that fact? Or why should the _notion_ of a complex fact have to precede it as its cause?

We must be on our guard against explaining _finality_ by the spirit: there is absolutely no reason whatever for ascribing to spirit the peculiar power of organising and systematising. The domain of the nervous system is much more extensive: the realm of consciousness is superadded. In the collective process of adaptation and systematising, consciousness plays no part at all.

527.

Physiologists, like philosophers, believe that consciousness increases in _value_ in proportion as it _gains_ in clearness: the most lucid consciousness and the most logical and impassive thought are of the _first_ order. Meanwhile--according to what standard is this value determined?--In regard to the _discharge of will-power_ the most superficial and _most simple_ thought is the most useful--it might therefore, etc. etc. (because it leaves few motives over).

Precision in action is opposed to the _far-sighted_ and often uncertain judgments of _caution:_ the latter is led by the _deeper_ instinct.

528.

The chief error of psychologists: they regard the indistinct idea as of a lower _kind_ than the distinct; but that which keeps at a distance from our consciousness and which is therefore _obscure, may_ on that very account be quite clear in itself. _The fact that a thing becomes obscure_ is a question _of the perspective of consciousness._

529.

The great misapprehensions:--

(1) The senseless _overestimation of consciousness,_ its elevation to the dignity of an entity: "a spirit," "a soul," something that feels, thinks, and wills;

(2) The spirit regarded as a _cause,_ especially where finality, system, and co-ordination appear;

(3) Consciousness classed as the highest form attainable, as the most superior kind of being, as "God";

(4) Will introduced wherever effects are observed;

(5) The "real world" regarded as the spiritual world, accessible by means of the facts of consciousness;

(6) Absolute knowledge regarded as the faculty of consciousness, wherever knowledge exists at all.

Consequences:--

Every step forward consists of a step forward in consciousness; every step backwards is a step into unconsciousness (unconsciousness was regarded as a falling-back upon the _passions_ and _senses--_as a state of _animalism ..._.)

Man approaches reality and real being through dialectics: man _departs_ from them by means of instincts, senses, and automatism....

To convert man into a spirit, would mean to make a god of him: spirit, will, goodness--all one.

All goodness must take its root in spirituality, must be a fact of consciousness.

Every step made towards _something better_ can be only a step forward in _consciousness._

(g) Judgment. True--false.

530.

Kant's theological bias, his unconscious dogmatism, his moral outlook, ruled, guided, and directed him.

The πρ■τον ψε■δος: how is the fact knowledge possible? Is knowledge a fact at all? What is knowledge? If we do not _know_ what knowledge is, we cannot possibly reply to the question, Is there such a thing as knowledge? Very _fine!_ But if I do not already "know" whether there is, or can be, such a thing as knowledge, I cannot reasonably ask the question, "What is knowledge?" Kant _believes_ in the fact of knowledge: what he requires is a piece of _naïveté: the knowledge of knowledge!_

"Knowledge is judgment." But judgment is a belief that something is this or that! And not knowledge! "All knowledge consists in synthetic judgments" which have the character of being _universally true_ (the fact is _so_ in all cases, and does not change), and which have the character of being _necessary_ (the reverse of the proposition cannot be imagined to exist).

The _validity_ of a belief in knowledge is always taken for granted; as is also the _validity_ of the feelings which conscience dictates. Here _moral ontology_ is the _ruling_ bias.

The conclusion, therefore, is: (1) there are propositions which we believe to be universally true and necessary.

(2) This character of universal truth and of necessity cannot spring from experience.

(3) Consequently it must base itself upon no experience at all, _but upon something else_, it must be derived from another source of knowledge!

Kant concludes (1) that there are some propositions which hold good only on one condition; (2) this condition is that they do not spring from experience, but from pure reason.

Thus, the question is, whence do we derive our reasons for _believing_ in the truth of such propositions? No, whence does our belief get its cause? But the _origin of a belief,_ of a strong conviction, is a psychological problem: and very limited and narrow experience frequently brings about such a belief! _It already presupposes_ that there are not only "data _a posteriori_" but also "data _a priori_"-- that is to say, "previous to experience." Necessary and universal truth cannot be given by experience: it is therefore quite clear that it has come to us without experience at all?

There is no such thing as an isolated judgment!

An isolated judgment is never "true," it is never knowledge; only in _connection with,_ and when _related to,_ many other judgments, is a guarantee of its truth forthcoming.

What is the difference between true and false belief? What is knowledge? He "knows" it, that is heavenly! Necessary and universal truth cannot be given by experience! It is therefore independent of experience, _of_ all experience! The view which comes quite _a priori,_ and therefore independent of all experience, _merely out of reason,_ is "pure knowledge"!

"The principles of logic, the principle of identity and of contradiction, are examples of pure knowledge, because they precede all experience."--But these principles are not cognitions, but _regulative articles of faith._

In order to establish the _a priori_ character (the pure rationality) of mathematical axioms, space _must be conceived as a form of pure reason._

Hume had declared that there were no _a priori_ synthetic judgments. Kant says there are--the mathematical ones! And if there are such judgments, there may also be such things as metaphysics and a knowledge of things by means of pure reason!

Mathematics is possible under conditions which are _not_ allowed to metaphysics. All human knowledge is either experience or mathematics.

A judgment is synthetic--that is to say, it co-ordinates various ideas. It is _a priori_--that is to say, this co-ordination is universally true and necessary, and is arrived at, not by sensual experience, but by pure reason.

If there are such things as _a priori_ judgments, then reason must be able to co-ordinate: co-ordination is a form. Reason must _possess a formative faculty._

Judging is our oldest faith; it is our habit of believing this to be true or false, of asserting or denying, our certainty that something is thus and not otherwise, our belief that we really "know"--_what_ is believed to be true in all judgments?

What are _attributes_?--We did not regard changes in ourselves merely as such, but as "things in themselves," which are strange to us, and which we only "perceive"; and we did _not_ class them as phenomena, but as Being, as "attributes"; and in addition we invented a creature to which they attach themselves--that is to say, we made the _effect_ the _working cause,_ and _the latter_ we made _Being._ But even in this plain statement, the concept "effect" is arbitrary: for in regard to those changes which occur in us, and of which we are convinced we ourselves are _not_ the cause, we still argue that they must be effects: and this is in accordance with the belief that "every change must have its author";--but this belief in itself is already mythology; for it _separates_ the working _cause from_ the cause in work. When I say the "lightning flashes," I set the flash down, once as an action and a second time as a subject acting; and thus a thing is fancifully affixed to a phenomenon, which is not one with it, but which is _stable,_ which _is,_ and does not "come."--_To make the phenomenon the working cause,_ and to make _the effect into a thing--into Being:_ this is the _double_ error, or _interpretation,_ of which we are guilty.

532.

The _Judgment_--that is the faith: "This and this is so. In every judgment, therefore, there lies the admission that an "identical" case has been met with: it thus takes some sort of comparison for granted, with the help of the memory. Judgment does _not_ create the idea that an identical case seems to be there. It believes rather that it actually perceives such a case; it works on the hypothesis that there are such things as identical cases. But what is that much _older_ function called, which must have been active much earlier, and which in itself equalises unequal cases and makes them alike? What is that second function called, which with this first one as a basis, etc. etc, "That which provokes the same sensations as another thing is equal to that other thing": but what is that called which makes sensations equal, which regards them as equal?--There could be no judgments if a sort of equalising process were not active within all sensations: memory is only possible by means of the underscoring of all that has already been experienced and learned. Before a judgment can be formed, _the process of assimilation must already have been completed_: thus, even here, an intellectual activity is to be observed which does not enter consciousness in at all the same way as the pain which accompanies a wound. Probably the psychic phenomena correspond to all the organic functions--that is to say, they consist of assimilation, rejection, growth, etc.

The essential thing is to start out from the body and to use it as the general clue. It is by far the richer phenomenon, and allows of much more accurate observation. The belief in the body is much more soundly established than the belief in spirit.

"However strongly a thing may be believed, the degree of belief is no criterion of its truth." But what is truth? Perhaps it is a form of faith, which has become a condition of existence? Then _strength_ would certainly be a criterion; for instance, in regard to causality.

533.

Logical accuracy, transparency, considered as the criterion of truth ("_omne illud verum est, quod clare et distincte percipitur._"--Descartes): by this means the mechanical hypothesis of the world becomes desirable and credible.

But this is gross confusion: like _simplex sigillum veri._ Whence comes the knowledge that the real nature of things stands in _this_ relation to our intellect? Could it not be otherwise? Could it not be this, that the hypothesis which gives the intellect the greatest feeling of power and security, is _preferred, valued,_ and marked as _true_--The intellect sets its _freest_ and _strongest faculty_ and _ability_ as the criterion of what is most valuable, consequently of what is _true...._

"True"--from the standpoint of sentiment--is that which most provokes sentiment ("I");

from the standpoint of thought--is that which gives thought the greatest sensation of strength;

from the standpoint of touch, sight, and hearing--is that which calls forth the greatest resistance.

Thus it is the _highest degrees of activity_ which awaken belief in regard to the _object_, in regard to its "reality." The sensations of strength, struggle, and resistance convince the subject that there is something which is being resisted.

534.

The criterion of truth lies in the enhancement of the feeling of power.

535.

According to my way of thinking, "truth" does not necessarily mean the opposite of error, but, in the most fundamental cases, merely the relation of different errors to each other: thus one error might be older, deeper than another, perhaps altogether ineradicable, one without which organic creatures like ourselves could not exist; whereas other errors might not tyrannise over us to that extent as conditions of existence, but when measured according to the standard of those other "tyrants," could even be laid aside and "refuted." Why should an irrefutable assumption necessarily be "true"? This question may exasperate the logicians who limit _things_ according to the limitations they find in themselves: but I have long since declared war with this logician's optimism.

536.

Everything simple is simply imaginary, but not "true." That which is real and true is, however, neither a unity nor reducible to a unity.

537.

What is truth?--Inertia; _that_ hypothesis which brings satisfaction, the smallest expense of intellectual strength, etc.

538.

First proposition. The _easier_ way of thinking always triumphs over the more difficult way;--_dogmatically_: _simplex sigillum veri_.--_Dico_: to suppose that _clearness_ is any proof of truth, is absolute childishness. . . .

Second proposition. The teaching of Being, of things, and of all those constant entities, is a _hundred times more easy_ than the teaching of _Becoming_ and of evolution. . .

Third proposition. Logic was intended to be a method of _facilitating_ thought: a _means of expression_, --not truth. . . . Later on it got to _act_ like truth. . . .

539.

Parmenides said: "One can form no concept of the non-existent";--we are at the other extreme, and say, "That Of which a concept can be formed, is certainly fictional."

540.

There are many kinds of eyes. Even the Sphinx has eyes--therefore there must be many kinds of "truths," and consequently there can be no truth.

541.

Inscriptions over the porch of a modern lunatic asylum.

"That which is necessarily true in thought must be necessarily true in morality."--HERBERT SPENCER.

"The ultimate test of the truth of a proposition is the inconceivableness of its negation,"--HERBERT SPENCER.

542.

If the character of existence were false,:--and this would be possible,--what would truth then be, all our truth? ... An unprincipled falsification of the false? A higher degree of falseness? ...

543.

In a world which was essentially false, truthfulness would be an _anti-natural tendency_: its only purpose would be to provide a means of attaining to a _higher degree of falsity._ For a world of truth and Being to be simulated, the truthful one would first have to be created (it being understood that he must believe himself to be "truthful").

Simple, transparent, not in contradiction with himself, lasting, remaining always the same to himself, free from faults, sudden changes, dissimulation, and form: such a man conceives a world of Being as "_God_" in His own image.

In order that truthfulness may be possible, the whole sphere in which man moves must be very tidy, small, and respectable: the advantage in every respect must be with the truthful one.--Lies, tricks, dissimulations, must cause astonishment.

544.

"Dissimulation" increases in accordance with the rising _order of rank_ among organic beings. In the inorganic world it seems to be entirely absent. There power opposes power quite roughly _--ruse_ begins in the organic world; plants are already masters of it. The greatest men, such as Cæsar and Napoleon (see Stendhal's remark concerning him),[3] as also the higher races (the Italians), the Greeks (Odysseus); the most supreme cunning, belongs to the very _essence_ of the elevation of man. ... The problem of the actor. My Dionysian ideal.... The optics of all the organic functions, of all the strongest vital instincts: the power which _will_ have error in all life; error as the very first principle of thought itself. Before "thought" is possible, "fancy" must first have done its work; the _picturing_ of identical cases, of the _seemingness_ of identity, is more primeval than the cognition of identity.

[Footnote 3: The reference to Stendhal here, seems to point to a passage in his _Life of Napoleon_ (Preface, p. xv) of which Nietzsche had made a note in another place, and which reads: "Une croyance presque instinctive chez moi c'est que tout homme puissant ment quand il parle et à plus forte raison quand il écrit."]

_(h)_ Against Causality.

545.

I believe in absolute space as the basis of force, and I believe the latter to be limited and formed. Time, eternal. But space and time as things in themselves do not exist. "Changes" are only appearances (or mere processes of our senses to us); if we set recurrence, however regular, between them, nothing is proved beyond the fact that it has always happened so. The feeling that _post hoc_ is _propter hoc,_ is easily explained as the result of a misunderstanding, it is comprehensible. But appearances cannot be "causes"!

546.

The interpretation of a phenomenon, _either_ as an action _or_ as the endurance of an action (that is to say, every action involves the suffering of it), amounts to this: every change, every differentiation, presupposes the existence of an agent and somebody acted upon, _who_ is "altered."

547.

Psychological history of the concept _subject._ The body, the thing, the "whole," which is visualised by the eye, awakens the thought of distinguishing between an action and an agent; the idea that the agent is the cause of the action, after having been repeatedly refined, at length left the "subject" over.

548.

Our absurd habit of regarding a mere mnemonic sign or abbreviated formula as an independent being, and ultimately as a _cause_; as, for instance, when we say of lightning that it flashes, even the little word "I." A sort of double-sight in seeing which makes sight a _cause of seeing in itself_: this was the feat in the invention of the "subject" of the "ego."

549.

"Subject," "object," "attribute"--these distinctions have been _made,_ and are now used like schemes to cover all apparent facts. The false fundamental observation is this, that I believe it is I who does something, who suffers something, who "has" something, who "has" a quality.

550.

In every judgment lies the whole faith in subject, attribute, or cause and effect (in the form of an assumption that every effect is the result of activity, and that all activity presupposes an agent), and even this last belief is only an isolated case of the first, so that faith remains as the most fundamental belief! there are such things as subjects, everything that happens is related attributively to a subject of some sort.

I notice something, and try to discover the reason of it: originally this was, I look for an _intention_ behind it, and, above all, I look for one who has an intention, for a subject, an agent: every phenomenon is an action, formerly intentions were seen behind _all_ phenomena, this is our oldest habit. Has the animal also this habit? As a living organism, is it not also compelled to interpret things through itself. The question why? is always a question concerning the _causa finalis,_ and the general "purpose" of things. We have no sign of the "sense of the efficient cause"; in this respect Hume is quite right, habit (but not only that of the individual) allows us to expect that a certain process, frequently observed, will follow upon another, but nothing more! That which gives us such an extraordinarily firm faith in causality, is not the rough habit of observing the sequence of processes, but our _inability_ to _interpret_ a phenomenon otherwise than as the result of _design._ It is the _belief in_ living and thinking things, as the only agents of _causation_; it is the belief in will, in design--the belief that all phenomena are actions, and that all actions presuppose an agent; it is the belief in the "subject." Is not this belief in the concepts subject and object an arrant absurdity?

Question: Is the design the cause of a phenomenon? Or is that also illusion? Is it not the phenomenon itself?

551.

A criticism of the concept "cause."--We have absolutely no experience concerning _cause_, viewed psychologically we derive the whole concept from the subjective conviction, that _we_ ourselves are causes--that is to say, that the arm moves.... _But that is an error._ We distinguish ourselves, the agents, from the action, and everywhere we make use of this scheme--we try to discover an agent behind every phenomenon. What have we done? We have _misunderstood_ a feeling of power, tension, resistance, a muscular feeling, which is already the beginning of the action, and posited it as a cause; or we have understood the will to do this or that, as a cause, because the action follows it. There is no such thing as "Cause," in those few cases in which it seemed to be given, and in which we projected it out of ourselves in_ order to understand a phenomenon,_ it has been shown to be an illusion. Our understanding of a phenomenon consisted in our inventing a subject who was responsible for something happening, and for the manner in which it happened. In our concept "cause" we have embraced our feeling of will, our feeling of "freedom," our feeling of responsibility and our design to do an action: _causa efficiens_ and _causa finalis_ are fundamentally one.

We believed that an effect was explained when we could point to a state in which it was inherent. As a matter of fact, we invent all causes according to the scheme of the effect: the latter is known to us.... On the other hand, we are not in a position to say of any particular thing how it will "act." The thing, the subject the will, the design--all inherent in the conception "cause." We try to discover things in order to explain why something has changed. Even the "atom" is one of these fanciful inventions like the "thing" and the "primitive subject."...

At last we understand that things--consequently also atoms--effect nothing: _because they are non-existent;_ and that the concept causality is quite! useless. Out of a necessary sequence of states, the latter's causal relationship does _not_ follow (that would be equivalent to extending their _active principle_ from 1 to 2, to 3, to 4, to 5). _There is no such thing as a cause or an effect._ From the standpoint of language we do not know how to rid ourselves of them. But that does not matter. If I imagine _muscle_ separated from its "effects," I have denied it....

In short: _a phenomenon is neither effected nor capable of effecting. Causa_ is a _faculty to effect something,_ superadded fancifully to what happens....

The interpretation of causality is an illusion.... A "thing" is the sum of its effects, synthetically united by means of a concept, an image. As a matter of fact, science has robbed the concept causality of all meaning, and has reserved it merely as an allegorical formula, which has made it a matter of indifference whether cause or effect be put on this side or on that. It is asserted that in two complex states (centres of force) the quantities of energy remain constant.

The calculability of a phenomenon does not lie in the fact that a rule is observed, or that a necessity is obeyed, or that we have projected a law of causality into every phenomenon: it lies in the _recurrence of "identical cases."_

There is no such thing as a _sense of causality,_ as Kant would have us believe. We are aghast, we feel insecure, we will have something familiar, which can be relied upon.... As soon as we are shown the existence of something old in a new thing, we are

pacified. The so-called instinct of causality is nothing more than the _fear of the unfamiliar_, and the attempt at finding something in it which is already _known._--It is not a search for causes, but for the familiar.

552.

To combat determinism and teleology.--From the fact that something happens regularly, and that its occurrence may be reckoned upon, it does not follow that it happens _necessarily._ If a quantity of force determines and conducts itself in a certain way in every particular case, it does not prove that it has "no free will." "Mechanical necessity" is not an established fact: it was _we_ who first read into the nature of all phenomena. We interpreted the possibility of _formularising_ phenomena as a result of the dominion of necessary law over all existence. But it does not follow, because I do a determined thing, that I am bound to do it. _Compulsion_ cannot be demonstrated in things: all that the rule proves is this, that one and the same phenomenon is not another phenomenon. Owing to the very fact that we fancied the existence of subjects "_agents_" in things, the notion arose that all phenomena are the _consequence_ of a _compulsory force_ exercised over the subject--exercised by whom? once more by an "agent." The concept "Cause and Effect" is a dangerous one, so long as people believe in something that _causes,_ and a something that is _caused._

_(a)_ Necessity is not an established fact, but an interpretation.

***

_(b)_ When it is understood that the "subject" is nothing that _acts,_ but only a thing of fancy, there is much that follows.

Only with the subject as model we invented _thingness_ and read it into the pell-mell of sensations. If we cease from believing in the _acting_ subject, the belief in _acting_ things, in reciprocal action, in cause and effect between phenomena which we call things, also falls to pieces.

In this case the world of _acting atoms_ also disappears: for this world is always assumed to exist on the pre-determined grounds that subjects are necessary.

Ultimately, of course, _the "thing-in-itself"_ also disappears: for at bottom it is the conception of a "subject-in-itself." But we have seen that the subject is an imaginary thing. The antithesis "thing-in-itself" and "appearance" is untenable; but in this way the concept "_appearance_" also disappears.

***

_(c)_ If we abandon the idea of the acting _subject,_ we also abandon the _object_ acted upon. Duration, equality to self, Being, are inherent neither in what is called subject, nor in what is called object: they are complex phenomena, and in regard to other phenomena are apparently durable--they are distinguishable, for instance, by the different tempo with which they happen (repose--movement, fixed --loose: all antitheses which do not exist in themselves and by means of which _differences of degree_ only are expressed; from a certain limited point of view, though, they seem to be antitheses. There are no such things as antitheses; it is from logic that we derive our concept of contrasts--and starting out from its standpoint we spread the error over all things).

***

_(d)_ If we abandon the ideas "subject" and "object"; then we must also abandon the idea _"substance"_--and therefore its various modifications too; for instance: "matter," "spirit," and other hypothetical things, "eternity and the immutability of matter," etc. We are then rid of _materiality._

***

From a moral standpoint _the world is false._ But inasmuch as morality itself is a part of this world, morality also is false. The will to truth is a process of _establishing things_, it is a process of _making_ things true and lasting, a total elimination of that _false_ character, a transvaluation of it into _being._ Thus, "truth" is not something which is present and which has to be found and discovered; it is something _which has to be created_ and which _gives_ its name _to a process,_ or, better still, to the Will to overpower, which in itself has no purpose: to introduce truth is a _processus in infinitum,_ an _active determining_--it is not a process of becoming conscious of something, which in itself is fixed and determined. It is merely a word for "The Will to Power."

Life is based on the hypothesis of a belief in stable and regularly recurring things, the mightier it is, the more vast must be the world of knowledge and the world called being. Logicising, rationalising, and systematising are of assistance as means of existence.

Man projects his instinct of truth, his "aim," to a certain extent beyond himself, in the form of a metaphysical world of Being, a "thing-in-itself," a world already to hand. His requirements as a creator make him _invent_ the world in which he works in advance; he anticipates it: this anticipation (this faith in truth) is his mainstay.

***

All phenomena, movement, Becoming, regarded as the establishment of relations of degree and of force, as a contest....

***

As soon as we _fancy_ that some one is responsible for the fact that we are thus and thus, etc. (God, Nature), and that we ascribe our existence, our happiness, our misery, our _destiny,_ to that some one, we corrupt the _innocence of Becoming_ for ourselves. We then have some one who wishes to attain to something by means of us and with us.

***

The "welfare of the individual" is just as fanciful as the "welfare of the species": the first is _not_ sacrificed to the last; seen from afar, the species is just as fluid as the individual. "The _preservation_ of the species" is only a result of the _growth_ of the species--that is to say, _of the overcoming of the species_ on the road to a stronger kind.

***

Theses:--The apparent conformity of means to end ("the conformity of means to end which far surpasses the art of man) is merely the result of that "_Will to Power_" which manifests itself in all phenomena:--_To become stronger_ involves a process of ordering, which may well be mistaken for an attempted conformity of means to end:--The _ends_ which are apparent are not intended but, as soon as a superior power prevails over an inferior power, and the latter proceeds to work as a function of the former, an order of _rank_ is established, an organisation which must give rise to the idea that there is an arrangement of means and ends.

Against apparent "_necessity_":--

This is only an expression for the fact that a certain power is not also something else.

Against the apparent conformity of means to ends":--

The latter is only an _expression_ for the order among the spheres of power and their interplay.

_(i)_ The Thing-in-Itself and Appearance.

553.

The foul blemish on Kant's criticism has at last become visible even to the coarsest eyes: Kant had no right to his distinction "_appearance_" and "_thing-in-itself,_"--in his own writings he had deprived himself of the right of differentiating any longer in this old and hackneyed manner, seeing that he had condemned the practice of drawing any conclusions concerning the cause of an appearance from the appearance itself, as unallowable in accordance with his conception of the idea of causality and its _purely intraphenomenal_ validity, and this conception, on the other hand, already anticipates that _differentiation,_ as if the "thing in itself" were not only inferred but actually _given._

554.

It is obvious that neither things-in-themselves _nor_ appearances can be related to each other in the form of cause and effect: and from this it follows that the concept "cause and effect" is _not applicable_ in a philosophy which believes in things-in-themselves and in appearances. Kant's mistake--... As a matter of fact, from a psychological standpoint, the concept "cause and effect" is derived from an attitude of mind which believes it sees the action of will upon will everywhere, which believes only in living things, and at bottom only in souls (not in things). Within the mechanical view of the world (which is logic and its application to space and time) that concept is reduced to the mathematical formula with which--and this is a fact which cannot be sufficiently emphasised--nothing is ever understood, but rather _defined_--deformed.

555.

The greatest of all fables is the one relating to knowledge. People would like to know how things-in-themselves are constituted: but behold, there are no things-in-themselves! But even supposing there _were_ an "in-itself," an unconditional thing, it could on that very account _not be known_! Something unconditioned cannot be known: otherwise it would not be unconditioned! Knowing, however, is always a process of "coming into relation with something"; the knowledge-seeker, on this principle, wants the thing, which he would know, to be nothing to him, and to be nothing to anybody at all: and from this there results a contradiction,--in the first place, between this _will_ to know, and this desire that the thing to be known _should_ be nothing to him (wherefore know at all then?); and secondly, because something which is nothing to anybody, does not even _exist,_ and therefore cannot be known. Knowing means: "to place one's self in relation with something," to feel one's self conditioned by something and one's self conditioning it under all circumstances, then, it is a process of _making stable or fixed,_ of _defining,_ of _making conditions conscious_ (not a process of _sounding_ things, creatures, or objects in-themselves).

556.

A "thing-in-itself" is just as absurd as a "sense-in-itself," a "meaning-in-itself." There is no such thing as a "fact-in-itself," _for a meaning must always be given to it before it can become a fact._

The answer to the question, "What is that?" is a process of _fixing a meaning_ from a different standpoint. The "_essence_" the "_essential factor,_" is something which is only seen as a whole in perspective, and which presupposes a basis which is multifarious. Fundamentally the question is "What is that for me?" (for us, for everything that lives, etc. etc.).

A thing would be defined when all creatures had asked and answered this question, "What is that?" concerning it. Supposing that one single creature, with its own relations and standpoint in regard to all things, were lacking, that thing would still remain undefined.

In short: the essence of a thing is really only an _opinion_ concerning that "thing." Or, better still; "_it is worth_" is actually what is meant by _"it is"_ or by "that is."

One may not ask: "_Who_ interprets, then?" for the act of interpreting _itself_ as a form of the Will to Power, manifests itself (not as "Being," but as a _process,_ as _Becoming_) as a passion.

The origin of "things" is wholly the work of the idealising, thinking, willing, and feeling subject. The concept thing as well as all its attributes.--Even "the subject" is a creation of this order, a "thing" like all others: a simplification, aiming at a definition of the _power_ that fixes, invents, and thinks, as such, as distinct from all isolated fixing, inventing, and thinking. Thus a capacity defined or distinct from all other individual capacities; at bottom action conceived collectively in regard to all the action which has yet to come (action and the probability of similar action).

557.

The qualities of a thing are its effects upon other "things."

If one imagines other "things" to be non-existent, a thing has no qualities.

That is to say; _there is nothing without other things._

That is to say; there is no "thing-in-itself."

558.

The thing-in-itself is nonsense. If I think all the "relations," all the "qualities" all the "activities" of a thing, away, the thing itself does _not_ remain: for "thingness" was only _invented fancifully_ by us to meet certain logical needs--that is to say, for the purposes of definition and comprehension (in order to correlate that multitude of relations, qualities, and activities).

559.

"Things which have a nature _in themselves_"--a dogmatic idea, which must be absolutely abandoned.

560.

That things should have a _nature in themselves,_ quite apart from interpretation and subjectivity, _is a perfectly idle hypothesis_: it would presuppose that _interpretation_ and the _act of being subjective_ are not essential, that a thing divorced from all its relations can still be a thing.

Or, the other way round: the apparent _objective_ character of things; might it not be merely the result of a _difference of degree_ within the subject perceiving?--could not that which changes slowly strike us as being objective, lasting, Being, "in-itself"?--could not the objective view be only a false way of conceiving things and a contrast _within_ the perceiving subject?

561.

If all unity were only unity as organisation. But the "thing" in which we believe was _invented_ only as a substratum to the various attributes. If the thing "acts," it means: we regard _all the other_ qualities which are to hand, and which are momentarily latent, as the cause accounting for the fact that one individual quality steps forward--that is to say, _we take the sum of its qualities--x--_as the cause of the quality _x_; which is obviously _quite_ absurd and imbecile!

All unity is _only so_ in the form of _organisation_ and _collective action:_ in the same way as a human community is a unity--that is to say, _the reverse of_ atomic _anarchy_; thus it is a body politic, which _stands for_ one, yet _is_ not one.

562.

"At some time in the development of thought, a point must have been reached when man became conscious of the fact that what he called the _qualities of a thing_ were merely the sensations of the feeling subject: and thus the qualities ceased from belonging to the thing." The "thing-in-itself" remained over. 'The distinction between the thing-in-itself and the thing-for-us, is based upon that older and artless observation which would fain grant energy to things: but analysis revealed that even force was only ascribed to them by our fancy, as was also--substance. "The thing affects a subject?" Thus the root of the idea of substance is in language, not in things outside ourselves! The thing-in-itself is not a problem at all!

Being will have to be conceived as a sensation which is no longer based upon anything quite devoid of sensation.

In movement no new _meaning_ is given to feeling. That which is, cannot be the substance of movement: it is therefore a form of Being.

_N.B._--The explanation of life may be sought, in the first place, through mental images of phenomena which _precede_ it (purposes);

Secondly, through mental images of phenomena which follow behind it (the mathematico-physical explanation).

The two should not be confounded. Thus: the physical explanation, which is the symbolisation of the world by means of feeling and thought, cannot in itself make feeling and thinking originate again and show its derivation: physics must rather construct the world of feeling, consistently _without feeling or purpose _ right up to the highest man. And teleology is only a _history of purposes,_ and is never physical.

563.

Our method of acquiring "knowledge" is limited to a process of establishing _quantities,_ but we can by no means help feeling the difference of quantity as differences of _quality._ Quality is merely a _relative_ truth for _us_; it is not a "thing-in-itself."

Our senses have a certain definite quantum as a mean, within the limits of which they perform their functions--that is to say, we become conscious of bigness and smallness in accordance with the conditions of our existence. If we sharpened or blunted our senses tenfold, we should perish--that is to say, we feel even _proportions_ as _qualities_ in regard to our possibilities of existence.

564.

But could not all _quantities_ be merely tokens of _qualities_? Another consciousness and scale of desires must correspond to greater power in fact, another point of view; growth in itself is the expression of a desire _to become more;_ the desire for a greater _quantum_ springs from a certain _quale,_ in a purely quantitative world, everything would be dead, stiff, and motionless.--The

reduction of all qualities to quantities is nonsense: it is discovered that they can only stand together, an analogy--

565.

Qualities are our insurmountable barriers; we cannot possibly help feeling mere _differences of quantity_ as something fundamentally different from quantity--that is to say, as _qualities,_ which we can no longer reduce to terms of quantity. But everything in regard to which the word "knowledge" has any sense at all, belongs to the realm of reckoning, weighing, and measuring, to quantity whereas, conversely, all our valuations (that is to say, our sensations) belong precisely to the realm of qualities, _i.e._ to those truths which belong to us alone and to our point of view, and which absolutely cannot be "known." It is obvious that every one of us, different creatures, must feel different qualities, and must therefore live in a different world from the rest. Qualities are an idiosyncrasy proper to human nature; the demand that these our human interpretations and values, should be general and perhaps real values, belongs to the hereditary madnesses of human pride.

566.

The "real world," in whatever form it has been conceived hitherto--was always the world of appearance _over again._

567.

The world of appearance, _i.e._ a world regarded in the light of values; ordered, selected according to values--that is to say, in this case, according to the standpoint of utility in regard to the preservation and the increase of power of a certain species of animals.

It is _the point of view,_ then, which accounts for the character of "appearance." As if a world could remain over, when the point of view is cancelled! By such means _relativity_ would also be cancelled!

Every centre of energy has its _point of view_ of the whole of the _remainder_ of the world--that is to say, its perfectly definite _valuation,_ its mode of action, its mode of resistance. The "world of appearance" is thus reduced to a specific kind of action on the world proceeding from a centre.

But there is no other kind of action: and the "world" is only a word for the collective play of these actions. _Reality_ consists precisely in this particular action and reaction of every isolated factor against the whole.

There no longer remains a shadow of a _right_ to speak here of "appearance." ...

The _specific way of reacting_ is the only way of reacting; we do not know how many kinds and what sort of kinds there are.

But there is no "_other,_" no "real," no essential being,--for thus a world _without_ action and reaction would be expressed....

The antithesis: world of appearance and real world, is thus reduced to the antitheses "world" and "nonentity."

568.

A criticism of the concept "_real and apparent_ world."--Of these two the first is a mere fiction, formed out of a host of imaginary things.

Appearance itself belongs to reality: it is a form of its being; _i.e._ in a world where there is no such thing as being, a certain calculable world of _identical_ cases must first be created through _appearance;_ a _tempo_ in which observation and comparison is possible, etc.

"Appearance" is an adjusted and simplified world, in which our _practical_ instincts have worked: for us it is perfectly true: for we _live_ in it, we can live in it: _this is the proof_ of its truth as far as we are concerned....

The world, apart from the fact that we have to live in it--the world, which we have _not_ adjusted to our being, our logic, and our psychological prejudices--does _not_ exist as a world "in-itself"; it is essentially a world of relations: under certain circumstances it has a _different aspect_ from every different point at which it is seen: it presses against every point, and every point resists it--and these collective relations are in every case _incongruent._

The _measure of power_ determines what _being_ possesses the other measure of power: under what form, force, or constraint, it acts or resists.

Our particular case is interesting enough: we have created a conception in order to be able to live in a world, in order to perceive just enough to enable us to _endure_ life in that world....

569.

The nature of our psychological vision is determined by the fact--

(1) That _communication_ is necessary, and that for communication to be possible something must be stable, simplified, and capable of being stated precisely (above all, in the so-called _identical_ case). In order that it may be communicable, it must be felt as something _adjusted,_ as "_recognisable_." The material of the senses, arranged by the understanding, reduced to coarse leading features, made similar to other things, and classified with its like. Thus: the indefiniteness and the chaos of sense-impressions are, as it were, _made logical._

(2) The _phenomenal_ world is the adjusted world which _we believe to be real,_ Its "reality" lies in the constant return of similar, familiar, and related things, in their _rationalised character,_ and in the belief that we are here able to reckon and determine.

(3) The opposite of this phenomenal world is not "the real world," but the amorphous and unadjustable world consisting of the chaos of sensations--that is to say, _another kind_ of phenomenal; world, a world which to us is "unknowable."

(4) The question how things-in-themselves are constituted, quite apart from our sense-receptivity and from the activity of our understanding, must be answered by the further question: how were we able to know _that things existed?_ "Thingness" is one of our own inventions. The question is whether there are not a good many more ways of creating such a world of appearance--and whether this creating, rationalising, adjusting, and falsifying be not the best-guaranteed _reality_ itself: in short, whether that which "fixes the meaning of things" is not the only reality: and whether the "effect of environment upon us" be not merely the result of such will-exercising subjects.... The other "creatures" act upon us; our _adjusted_ world of appearance is an arrangement and an _overpowering_ of its activities: a sort of _defensive_ measure. _The subject alone is demonstrable_; the _hypothesis_ might be advanced _that subjects are all that exist,_--that "object" is only a form of action of subject upon subject ... a _modus of the subject._

_(k)_ The Metaphysical Need.

570.

If one resembles all the philosophers that have gone before, one can have no eyes for what has existed and what will exist--one sees only what _is._ But as there is no such thing as Being; all that the philosophers had to deal with was a host of _fancies,_ this was their "world."

571.

To assert the _existence_ as a whole of things concerning which we know nothing, simply because there is an advantage in not being able to know anything of them, was a piece of artlessness on Kant's part, and the result of the recoil-stroke of certain needs--especially in the realm of morals and metaphysics.

572.

An artist cannot endure reality; he turns away or back from it: his earnest opinion is that the worth of a thing consists in that nebulous residue of it which one derives from colour, form, sound, and thought; he believes that the more subtle, attenuated, and volatile, a thing or a man becomes, _the more valuable he becomes: the less real,_ the greater the worth. This is Platonism: but Plato was guilty of yet further audacity in the matter of turning tables--he measured the degree of reality according to the degree of value, and said: The more there is of "idea" the more there is of Being. He twisted the concept "reality" round and said: "What ye regard as real is an error, and the nearer we get to the 'idea' the nearer we are to 'truth.'"--Is this understood? It was the _greatest of all rechristenings:_ and because Christianity adopted it, we are blind to its astounding features. At bottom, Plato, like the artist he was, _placed appearance before_ Being! and therefore lies and fiction before truth! unreality before actuality!--He was, however, so convinced of the value of appearance, that he granted it the attributes of "Being," "causality," "goodness," and "truth," and, in short, all those things which are associated with value.

The concept value itself regarded as a cause: first standpoint.

The ideal granted all attributes, conferring honour: second standpoint.

573.

The idea of the "true world" or of "God" as absolutely spiritual, intellectual, and good, is an _emergency measure_ to the extent to which the _antagonistic_ instincts are all-powerful....

Moderation and existing humanity is reflected exactly in the humanisation of the gods. The Greeks of the strongest period, who entertained no fear whatever of themselves, but on the contrary were pleased with themselves, brought down their gods to all their emotions.

The spiritualisation of the idea of God is thus very far from being a sign of _progress_: one is heartily conscious of this when one reads Goethe--in his works the vaporisation of God into virtue and spirit is felt as being upon a lower plane.

574.

The nonsense of all metaphysics shown to reside in the derivation of the conditioned out of the unconditioned.

It belongs to the nature of thinking that it adds the unconditioned to the conditioned, that it invents it--just as it thought of and invented the "ego" to cover the multifariousness of its processes i it measures the world according to a host of self-devised measurements--according to its fundamental fictions "the unconditioned," "end and means," "things," "substances," and according to logical laws, figures, and forms.

There would be nothing which could be called knowledge, if thought did not first so _re-create_ the world into "things" which are in its own image. It is only _through_ thought that there is _untruth._

The _origin_ of thought, like that of _feelings,_ cannot be traced: but that is _no_ proof of its primordiality or absoluteness! It simply shows that we cannot get _behind it,_ because we have nothing else save thought and feeling.

575.

To know is to _point to past experience:_ in its nature it is a _regressus in infinitum._ That which halts (in the face of a so-called _causa prima_ or the unconditioned, etc.) is _laziness,_ weariness.

576.

Concerning the psychology of metaphysics--the influence of fear. That which has been most feared, the cause of the _greatest suffering_ (lust of power, voluptuousness, etc.), has been treated with the greatest amount of hostility by men, and eliminated from the "real" world. Thus the _passions_ have been step by step _struck out,_ God posited as the opposite of evil--that is to say, reality is conceived to be the _negation of the passions and the emotions_ (i.e. _nonentity_).

Irrationality, impulsive action, accidental action, is, moreover, hated by them (as the cause of incalculable suffering). _Consequently_ they denied this element in the absolute, and interpreted it as absolute "rationality" and "conformity of means to ends."

Change and _perishability_ were also feared; and by this fear an oppressed soul is revealed, full of distrust and painful experiences (the case with _Spinoza_: a man differently constituted would have regarded this change as a charm).

A nature overflowing and _playing_ with energy, would call precisely the _passions, irrationality_ and _change, good_ in a eudemonistic sense, together with their consequences: danger, contrast, ruin, etc.

577.

Against the value of that which always remains the same (remember Spinoza's artlessness and Descartes' likewise), the value of the shortest and of the most perishable, the seductive flash of gold on the belly of the serpent _vita_----

578.

Moral values in epistemology itself:--

The faith in reason--why not mistrust?

The "real world" is the good world--why?

Appearance, change, contradiction, struggle, regarded as immoral: the desire for a world which _knows nothing_ of these things.

The transcendental world discovered, _so that_ a place may be kept for "moral freedom" (as in Kant).

Dialectics as the road to virtue (in Plato and Socrates: probably because sophistry was held to be the road to immorality).

Time and space are ideal: consequently there is unity in the essence of things; consequently no sin, no evil, no imperfection, a _justification_ of God.

Epicurus _denied_ the possibility of knowledge, in order to keep the moral (particularly the hedonistic) values as the highest.

Augustine does the same, and later Pascal ("corrupted reason"), in favour of Christian values.

Descartes' contempt for everything variable; likewise Spinoza's.

579.

Concerning the psychology of metaphysics.--This world is only apparent: _therefore_ there must be a real world;--this world is conditioned: _consequently_ there must be an unconditioned world;--this world is contradictory: _consequently_ there is a world free from contradiction;--this world is evolving: _consequently_ there is somewhere a static world:--a host of false conclusions (blind faith in reason: if A exists, then its opposite B must also _exist_). Pain _inspires these conclusions_: at bottom they are _withes_ that such a world might exist; the hatred of a world which leads to suffering is likewise revealed by the fact that another and _better_ world is imagined: the _resentment_ of the metaphysician against reality is creative here.

The second series of questions: _wherefore_ suffer? ... and from this a conclusion is derived concerning the relation of the real world to our apparent, changing, suffering, and contradictory world: (1) Suffering as the consequence of error: how is error possible? (2) Suffering as the consequence of guilt: how is guilt possible? (A host of experiences drawn from the sphere of nature or society, universalised and made absolute.) But if the conditioned world be causally determined by the unconditioned, then the _freedom to err, to be sinful,_ must also be derived from the same quarter: and once more the question arises, _to what purpose?_ ... The world of appearance, of Becoming, of contradiction, of suffering, is therefore _willed; to what purpose?_

The error of these conclusions; two contradictory concepts are formed--because one of them corresponds to a reality, the other "_must_" also correspond to a reality. "_Whence_" would one otherwise derive its contradictory concept? _Reason_ is thus a source of revelation concerning the absolute.

But the _origin_ of the above contradictions _need not necessarily_ be a supernatural source of reason: it is sufficient to oppose t_he real genesis_ of the concepts, this springs from practical spheres, from utilitarian spheres, hence the _strong faith_ it commands _(one is threatened with ruin_ if one's conclusions are not in conformity with this reason; but this fact is no "_proof_" of what the latter asserts).

The preoccupation of metaphysicians with pain, is quite artless. "Eternal blessedness": psychological nonsense. Brave and creative men never make pleasure and pain ultimate questions--they are incidental conditions: both of them must be desired when one _will attain to_ something. It is a sign of fatigue and illness in these metaphysicians and religious men, that they should press questions of pleasure and pain into the foreground. Even _morality_ in their eyes derives its great importance _only_ from the fact that it is regarded as an essential condition for abolishing pain.

The same holds good of the preoccupation with appearance and error the cause of pain. A superstition that happiness and truth are related (confusion: happiness in "certainty," in "faith").

580.

To what extent are the various _epistemological positions_ (materialism, sensualism, idealism) consequences of valuations? The source of the highest feelings of pleasure ("feelings of value") may also judge concerning the problem of _reality_!

The measure of _positive knowledge_ is quite a matter of indifference and beside the point; as witness the development of Indici.

The Buddhistic _negation_ of reality in general (appearance pain) is perfectly consistent: undemonstrability, inaccessibility, lack of categories, not only for an "absolute world," but a recognition of the _erroneous procedures_ by means of which the whole concept has been reached. "Absolute reality," "Being in itself," a contradiction. In a world of _Becoming,_ reality is merely a _simplification_ for the purpose of practical ends, or a _deception_ resulting from the coarseness of certain organs, or a variation in the tempo of Becoming.

The logical denial of the world and Nihilism is a consequence of the fact that we must oppose nonentity with Being, and that Becoming is denied. ("_Something_" becomes.)

581.

Being and _Becoming._--"_Reason_" developed upon a sensualistic basis upon the _prejudices of the senses_--that is to say, with the belief in the truth of the judgment of the senses.

"Being," as the generalisation of the concept "_Life_" (breath), "to be animate," "to will," "to act upon," "become."

The opposite is: "to be inanimate," "_not_ to become," "_not_ to will." _Thus_: "Being" is _not_ opposed to "not-Being," to "appearance," nor is it opposed to death (for only that can be dead which can also live).

The "soul," the "ego," posited as _primeval facts;_ and introduced wherever _there is Becoming._

582.

Being--we have no other idea of it than that which we derive from "_living._"--How then can everything "be" dead?

583.

_A._

I see with astonishment that science resigns itself to-day to the fate of being reduced to the world of appearance: we certainly have no organ of knowledge for the real world--be it what it may.

At this point we may well ask: With what organ of knowledge is this contradiction established?...

The fact that a world which is accessible to our organs is also understood to be dependent upon these organs, and the fact that we should understand a world as subjectively conditioned, are _no_ proofs of the actual _possibility_ of an objective world. Who urges us to believe that subjectivity _is_ real or essential?

The absolute is even an absurd concept: an "absolute mode of existence" is nonsense, the concept "being," "thing," is always _relative_ to us.

The trouble is that, owing to the old antithesis "apparent" and "real," the correlative valuations "of little value" and "absolutely valuable" have been spread abroad.

The world of appearance does not strike us as a "valuable" world; appearance is on a lower plane than the highest value. Only a "real" world can be absolutely "valuable"....

Prejudice of prejudices! It is perfectly possible in itself that the real nature of things would be so unfriendly, so opposed to the first conditions of life, that appearance is necessary in order to make life possible.... This is certainly the case in a large number of situations--for instance, marriage.

Our empirical world would thus be conditioned, even in its limits to knowledge, by the instinct of self-preservation, we regard that as good, valuable, and true, which favours the preservation of the species....

_(a)_ We have no categories which allow us to distinguish between a real and an apparent world. (At the most, there could exist a world of appearance, but not _our_ world of appearance.)

_(b)_ Taking the _real_ world for granted, it might still be the _less valuable_ to us; for the quantum of illusion might be of the highest order, owing to its value to us as a preservative measure. (Unless _appearance_ in itself were sufficient to condemn anything?)

_(c)_ That there exists a correlation between the _degrees of value_ and the _degrees of reality_ (so that the highest values also possessed the greatest degree of reality), is a metaphysical postulate which starts out with the hypothesis that we _know_ the order of rank among values; and that this order is a _moral_ one. It is only on this hypothesis that _truth_ is necessary as a definition of all that is of a superior value.

_B._

It is of cardinal importance that the _real world_ should be suppressed. It is the most formidable inspirer of doubts, and depredator of values, concerning the _world which we are_: it was our most dangerous_ attempt_ heretofore on the life of Life.

War against all the hypotheses upon which a real world has been imagined. The notion that _moral values_ are the _highest_ values, belongs to this hypothesis.

The superiority of the moral valuation would be refuted, if it could be shown to be the result of an _immoral_ valuation--a specific case of real immorality: it would thus reduce itself to an _appearance,_ and as an _appearance_ it would cease from having any right to condemn appearance.

_C._

Then the "Will to Truth" would have to be examined psychologically: it is not a moral power, but a form of the Will to Power. This would have to be proved by the fact that it avails itself of every _immoral_ means there is; above all, of the metaphysicians.

At the present moment we are face to face with the necessity of testing the assumption that moral values are the highest values, _Method in research_ is attained only when all _moral prejudices_ have been overcome: it represents a conquest over morality....

584.

The aberrations of philosophy are the outcome of the fact that, instead of recognising in logic and the categories of reason merely a means to the adjustment of the world for utilitarian ends (that is to say, especially, a useful _falsification_), they were taken to be the criterion of truth--particularly of _reality._ The "criterion of truth" was, as a matter of fact, merely the _biological utility of a systematic falsification of this sort, on principle:_ and, since a species of animals knows nothing more important than its own preservation, it was indeed allowable here to speak of "truth." Where the artlessness came in, however, was in taking this anthropocentric idiosyncrasy as the _measure of things,_ as the canon for recognising the "real" and the "unreal": in short, in making a relative thing absolute. And behold, all at once, the world fell into the two halves, "real" and "apparent": and precisely that world which man's reason had arranged for him to live and to settle in, was discredited. Instead of using the forms as mere instruments for making the world manageable and calculable, the mad fancy of philosophers intervened, and saw that in these categories the concept of that world is given which does not correspond to the concept of the world in which man lives.... The means were misunderstood as measures of value, and even used as a condemnation of their original purpose....

The purpose was, to deceive one's self in a useful way: the means thereto was the invention of forms and signs, with the help of which the confusing multifariousness of life could be reduced to a useful and wieldy scheme.

But woe! a _moral category_ was now brought into the game: no creature would deceive itself, no creature may deceive itself--consequently there is only a will to truth. What is "truth"?

The principle of contradiction provided the scheme: the real world to which the way is being sought cannot be in contradiction with itself, cannot change, cannot evolve, has no beginning and no end.

That is the greatest error which has ever been committed, the really fatal error of the world: it was believed that in the forms of reason a criterion of reality had been found--whereas their only purpose was to master reality, by _misunderstanding_ it intelligently....

And behold, the world became false precisely owing to the qualities _which constitute its reality,_ namely, change, evolution, multifariousness, contrast, contradiction, war. And thenceforward the whole fatality was there.

1. How does one get rid of the false and merely apparent world? (it was the real and only one).

2. How does one become one's self as remote as possible from the world of appearance? (the concept of the perfect being as a contrast to the real being; or, more correctly still, as _the contradiction of life_....).

The whole direction of values was towards the _slander of life_; people deliberately confounded ideal dogmatism with knowledge in general: so that the opposing parties also began to reject _science_ with horror.

Thus the road to science was _doubly_ barred: first, by the belief in the real world; and secondly, by the opponents of this belief. Natural science and psychology were (1) condemned in their objects, (2) deprived of their artlessness....

Everything is so absolutely bound and related to everything else in the real world, that to condemn, or to _think away_ anything, means to condemn and think away the whole. The words "this should not be," "this ought not to be," are a farce.... If one imagines the consequences, one would ruin the very source of Life by suppressing everything which is in any sense whatever _dangerous or destructive._ Physiology proves this _much better_!

We see how morality _(a) poisons_ the whole concept of the world, _(b)_ cuts off the way to _science, (c)_ dissipates and undermines all real instincts (by teaching that their root is _immoral_).

We thus perceive a terrible tool of decadence at work, which succeeds in remaining immune, thanks to the holy names and holy attitudes it assumes.

585.

The awful recovery of our _consciousness:_ not of the individual, but of the human species. Let us reflect; let us think backwards; let us follow the narrow and broad highway.

_A._

Man seeks "the truth": a world that does not contradict itself, that does not deceive, that does not change, a _real_ world--a world in which there is no suffering: contradiction, deception, variability---the causes of suffering! He does not doubt that there is such a thing as a world as it ought to be; he would fain find a road to it. (Indian criticism: even the ego is apparent and _not_ real.)

Whence does man derive the concept of _reality_? --Why does he make variability, deception, contradiction, the origin of _suffering;_ why not rather of his happiness? ...

The contempt and hatred of all that perishes, changes, and varies: whence comes this valuation of stability? Obviously, the will to truth is _merely_ the longing for a _stable world._

The senses deceive; reason corrects the errors: _therefore,_ it was concluded, reason is the road to a static state; the most _spiritual_ ideas must be nearest to the "real world."--It is from the senses that the greatest number of misfortunes come they are cheats, deluders, and destroyers.

Happiness can be promised only by Being: change and happiness exclude each other. The loftiest desire is thus to be one with Being. That is the formula for the way to happiness.

In summa: The world as it _ought_ to be exists; this world in which we live is an error--this our world should _not_ exist.

The belief in Being shows itself only as a result: the real primum _mobile_ is the disbelief in Becoming, the mistrust of Becoming, the scorn of all Becoming....

What kind of a man reflects in this way? An unfruitful, _suffering_ kind, a world-weary kind. If we try and fancy what the opposite kind of man would be like, we have a picture of a creature who would not require the belief in Being; he would rather despise it as dead, tedious, and indifferent....

The belief that the world which ought to be, is, really exists, is a belief proper to the unfruitful, _who do not wish to create a world as it should be._ They take it for granted, they seek for means and ways of attaining to it. "The will to truth"--_is the impotence of the will to create._

To recognise that something } Antagonism in is _thus_ or _thus:_ } the degrees of To act so that something will } energy in be _thus_ or _thus:_ } various natures.

The fiction of a world which corresponds to our desires; psychological artifices and interpretations calculated to associate all that we honour and regard as pleasant, with this _real world._

"The will to truth" at this stage is essentially _the art of interpretation:_ to which also belongs that interpretation which still possesses strength.

The same species of men, grown one degree poorer, _no longer possessed of the power_ to interpret and to create fictions, produces the Nihi_lists._ A Nihilist is the man who says of the world as it is, that it ought _not_ to exist, and of the world as it ought to be, that it does not exist. According to this, existence (action, suffering, willing, and feeling) has no sense: the pathos of the "in vain" is the Nihilist's pathos--and as pathos it is moreover an _inconsistency_ on the part of the Nihilist.

He who is not able to introduce his will into things, the man without either will or energy, at least invests them with some meaning, _i.e._ he believes that a will is already in them.

The degree of a man's _will-power_ may be measured from the extent to which he can dispense with the meaning in things, from the extent to which he is able to endure a world without meaning: _because he himself arranges a small portion of it._

The _philosophical objective view of things_ may thus be a sign of poverty both of will and of energy. For energy organises what is closest and next; the "scientists," whose only desire is to _ascertain_ what exists, are such as cannot arrange things _as they ought to be._

The _artists,_ an intermediary species, they at least set up a symbol of what should exist,--they are productive inasmuch as they actually _alter_ and transform; not like the scientists, who leave everything as it is.

The connection between philosophers and the pessimistic religions; the same species of man (_they attribute the highest degree of reality_ to the _things which are valued highest_).

The connection between philosophers and moral men and their evaluations (the _moral_ interpretation of the world as the sense of the world: after the collapse of the religious sense).

The overcoming of philosophers by the annihilation of the world of being: intermediary period of Nihilism; before there is sufficient strength present to transvalue values, and to make the world of becoming, and of appearance, the _only_ world to be deified and called good.

_B._

Nihilism as a normal phenomenon may be a symptom of increasing _strength_ or of increasing _weakness_:--

Partly owing to the fact that the strength _to create_ and _to will_ has grown to such an extent, that it no longer requires this collective interpretation and introduction of a _sense_ ("present duties," state, etc.);

Partly owing to the fact that even the creative power necessary to invent sense, declines, and disappointment becomes the ruling condition. The inability to _believe_ in a sense becomes "unbelief."

What is the meaning of _science_ in regard to both possibilities?

(1) It is a sign of strength and self-control; it shows an _ability_ to dispense with healing, consoling worlds of illusion.

(2) It is also able to undermine, to dissect, to disappoint, and to weaken.

_C._

The belief in truth, the need of holding to something which is believed to be true: psychological reduction apart from the valuations that have existed hitherto. Fear and laziness.

At the same time _unbelief:_ Reduction. In what way does it acquire a _new value,_ if a real world does not exist at all (by this means the capacity of valuing, which hitherto has been _lavished_ upon the world of being, becomes free once more).

586.

The _real_ and the _ "apparent" world._

_A._

The _erroneous concepts_ which proceed from this concept are of three kinds:--

_(a)_ An unknown world:--we are adventurers, we are inquisitive,--that which is known to us makes us weary (the danger of the concept lies in the fact it suggests that "this" world is known to us....);

(b) Another world, where things are different:--something in us draws comparisons, and thereby our calm submission and our silence lose their value--perhaps all will be for the best, we have not hoped in vain.... The world where things are different--who knows?--where we ourselves will be different....

_(c)_ A _real_ world:--that is the most singular blow and attack which we have ever received; so many things have become encrusted in the word "true," that we involuntarily give these to the "real world"; the _real_ world must also be a _truthful_ world, such a one as would not deceive us or make fools of us; to believe in it in this way is to be almost _forced_ to believe (from convention, as is the case among people worthy of confidence).

***

The concept, "the _unknown_ world," suggests that this world is known to us (is tedious);

The concept, "the other world," suggests that this world _might be different,_ it suppresses necessity and fate (it is useless to _submit_ and to _adapt one's self_);

The concept, _the true world,_ suggests that this world is untruthful, deceitful, dishonest, not genuine, and not essential, and _consequently_ not a world calculated to be useful to us (it is unadvisable to become adapted to it; _better_ resist it).

***

Thus we _escape_ from "this" world in three different ways:----

_(a)_ With our _curiosity_--as though the interesting part was somewhere else;

_(b)_ With our _submission_--as though it was not necessary to submit, as though this world was not an ultimate necessity;

_(c)_ With our _sympathy_ and respect--as though this world did not deserve them, as though it was mean and dishonest towards us....

In summa: we have become revolutionaries in three different ways; we have made _x_ our criticism of the "known world."

_B._

The first step to reason: to understand to what extent we have been _seduced,_--for it might be _precisely_ the reverse:

_(a)_ The _unknown_ world could be so constituted as to give us a liking for "this" world--it may be a more stupid and meaner form of existence.

_(b)_ The other world, very far from taking account of our desires which were never realised here, might be part of the mass of things which _this_ world makes possible for us; to learn to know this world would be a means of satisfying us,

_(c)_ The _true_ world: but who actually says that the apparent world must be of less value than the true world? Do not our instincts contradict this judgment? Is not man eternally occupied in creating an imaginative world, because he will have a better world than reality? _In the first place,_ how do we know that _our_ world is _not_ the true world? ... for it might be that the other world is the world of "appearance" (as a matter of fact, the Greeks, for instance, actually imagined a _region of shadows, a life of appearance,_ beside _real_ existence). And finally, what right have we to establish _degrees of reality,_ as it were? That is something different from an unknown world--that is already the _will to know something of the unknown._ The "other," the "unknown" world--good! but to speak of the "true world" is as good as "_knowing_ something about it,"--that is the _contrary_ of the

assumption of an _x_-world....

In short, the world _x_ might be in every way a more tedious, a more inhuman, and a less dignified world than this one.

It would be quite another matter if it were assumed that there were several _x_-worlds--that is to say, every possible kind of world besides our own. But this has _never been assumed...._

_C._

Problem: why has the _image of the other world_ always been to the disadvantage of "this" one--that is to say, always stood as a criticism of it; what does this point to?--

A people that are proud of themselves, and who are on the ascending path of Life, always; picture _another_ existence as lower and less valuable than theirs; they regard the strange unknown world as their enemy, as their opposite; they feel no curiosity, but rather repugnance in regard to what is strange to them.... Such a body of men would never admit that another people were the "true people"....

The very fact that such a distinction is possible,--that this world should be called the world of appearance, and that the other should be called the true world,--is symptomatic.

The places of origin of the idea, of "another world":

The philosopher who invents a rational world where _reason_ and logical functions are adequate:--this is the root of the "true" world.

The religious man who invents a "divine world";--this is the root of the "denaturalised" and the "anti-natural" world.

The moral man who invents a "free world":--this is the root of the good, the perfect, the just, and the holy world.

The _common factor_ in the three places of origin: _psychological_ error, physiological confusion.

With what attributes is the "other world," as it actually appears in history, characterised? With the stigmata of philosophical, religious, and moral prejudices.

The "other world" as it appears in the light of these facts, is _synonymous_ with _not-Being,_ with not-living, with the _will_ not to live....

General aspect: it was the instinct of the _fatigue of living,_ and not that of life, which created the "other world."

Result: philosophy, religion, and morality are _symptoms of decadence._

_(l)_ The Biological Value of Knowledge.

587.

It might seem as though I had evaded the question concerning "certainty". The reverse is true: but while raising the question of the criterion of certainty, I wished to discover the weights and measures with which men had weighed heretofore--and to show that the question concerning certainty is already in itself a _dependent_ question, a question of the second rank.

588.

The question of values is more _fundamental_ than the question of certainty: the latter only becomes serious once the question of values has been answered.

Being and appearance, regarded psychologically, yield no "Being in itself," no criterion for reality, but only degrees of appearance, measured according to the strength of the sympathy which we feel for appearance.

There is no struggle for existence between ideas and observations, but only a struggle for supremacy--the vanquished idea is _not annihilated,_ but only _driven to the background_ or _subordinated. There is no such thing as annihilation in intellectual spheres._

589.

"End and means" "Cause and effect" "Subject and object" "Action and suffering" "Thing-in-itself and appearance"

As interpretations (_not_ as established facts)--and in what respect were they perhaps necessary interpretations? (as "preservative measures")--all in the sense of a Will to Power.

590.

Our values are _interpreted into the heart_ of things.

Is there, then, any _sense_ in the absolute?

Is not sense necessarily _relative-sense_ and perspective?

All sense is Will to Power (all relative senses may be identified with it).

591.

The desire for "established facts"--Epistemology: how much pessimism there is in it!

592.

The antagonism between the "true world," as pessimism depicts it, and a world in which it were possible to live--for this the rights of _truth_ must be tested. It is necessary to measure all these "ideal forces" according to the standard of life, in order to understand the nature of that antagonism: the struggle of sickly, desperate life, cleaving to a beyond, against healthier, more foolish, more false, richer, and fresher life. Thus it is not "truth" struggling with Life, but _one_ kind of Life with another kind.--But the former would fain be the _higher_ kind!--Here we must prove that some order of rank is necessary,--that the first problem is _the order of rank among kinds of Life._

593.

The belief, "It is _thus_ and _thus,_" must be altered into the will, "Thus and thus _shall it be._"

_(m)_ Science.

594.

Science hitherto has been a means of disposing of the confusion of things by hypotheses which "explain everything"--that is to say, it has been the result of the intellect's repugnance to chaos. This same repugnance takes hold of me when I contemplate _myself;_ I should like to form some kind of representation of my inner world for myself by means of a _scheme,_ and thus overcome intellectual confusion. Morality was a simplification of this sort: it taught man as _recognised,_ as _known,_--Now we have annihilated morality--we have once more grown _completely obscure_ to ourselves! I know that I know nothing _about myself. Physics_ shows itself to be a _boon_ for the mind: science (as the road to _knowledge_) acquires a new charm after morality has been laid aside--and _owing to the fact_ that we find consistency here alone, we must _order_ our lives in accordance with it so that it may help us to _preserve it. _ This results in a sort of _practical meditation_ concerning the _conditions of our existence_ as investigators.

595.

Our first principles: no God: no purpose: limited energy. We will take good care to _avoid_ thinking out and prescribing the necessary lines of thought for the lower orders.

596.

No "_moral_ education" of humanity: but the _disciplinary school of scientific errors_ is necessary, because truth disgusts and creates a dislike of life, provided a man is not already irrevocably launched upon his _way,_ and bears the consequences of his honest standpoint with tragic pride.

597.

The first principle of _scientific work:_ faith in the union and continuance of scientific work, so that the individual may undertake to work at any point, however small, and feel sure that his efforts _will not be in vain._

There is a great paralysing force: to work _in vain,_ to struggle _in vain._

***

The periods of _hoarding,_ when energy and power are stored, to be utilised later by subsequent periods: _Science_ as a _half-way house,_ at which the mediocre, more multifarious, and more complicated beings find their most natural gratification and means of expression: all those who do well to avoid _action._

598.

A. philosopher recuperates his strength in a way quite his own, and with other means: he does it, for instance, with Nihilism. The belief _that there is no such thing as truth,_ the Nihilistic belief, is a tremendous relaxation for one who, as a warrior of knowledge, is unremittingly struggling with a host of hateful truths. For truth is ugly.

599.

The "purposelessness of all phenomena": the belief in this is the result of the view that all interpretations hitherto have been false, it is a generalisation on the part of discouragement and weakness--it is not a necessary belief.

The arrogance of man: when he sees no purpose, he _denies_ that there can be one!

600.

The unlimited ways of interpreting the world: every interpretation is a symptom of growth or decline.

Unity (monism) is a need of inertia; Plurality in interpretation is a sign of strength. One should not _desire to deprive_ the world of its disquieting and enigmatical nature.

601.

Against the desire for reconciliation and peaceableness. To this also belongs every attempt on the part of monism.

602.

This relative world, this world for the eye, the touch, and the ear, is very false, even when adjusted to a much more sensitive sensual apparatus. But its comprehensibility, its clearness, its practicability, its beauty, will begin to _near their end_ if we _refine_ our senses, just as beauty ceases to exist when the processes of its history are reflected upon: the arrangement of the _end_ is in itself an illusion. Let it suffice, that the more coarsely and more superficially it is understood, the _more valuable,_ the more definite, the more beautiful and important the world then seems. The more deeply one looks into it, the further our valuation retreats from our view,-_senselessness approaches!_ We have created the world that has any value! Knowing this, we also perceive that the veneration of truth is already the _result of illusion_--and that it is much more necessary to esteem the formative, simplifying, moulding, and romancing power.

"All is false--everything is allowed!"

Only as the result of a certain bluntness of vision and the desire for simplicity does the beautiful and the "valuable" make its appearance: in itself it is purely fanciful.

603.

We know that the destruction of an illusion does not necessarily produce a truth, but only one more piece of _ignorance;_ it is the extension of our "empty space," an increase in our "waste."

604.

Of what alone can _knowledge_ consist?--"Interpretation," the introduction of a sense into things, _not_ "explanation" (in the majority of cases a new interpretation of an old interpretation which has grown incomprehensible and little more than a mere sign). There is no such thing as an established fact, everything fluctuates, everything, is intangible, yielding; after all, the most lasting of all things are our opinions.

605.

The ascertaining of "truth" and "untruth," the ascertaining of facts in general, is fundamentally different from the creative _placing,_ forming, moulding, subduing, and _willing_ which lies at the root of _philosophy. To give a sense to things_--this duty always remains _over,_ provided _no sense already lies in them._ The same holds good of sounds, and also of the fate of nations they are susceptible of the most varied interpretations and turns, _for different purposes._

A higher duty is to _fix a goal_ and to mould facts according to it: _that is,_ the _interpretation of action,_ and not merely a _transvaluation_ of concepts.

606.

Man ultimately finds nothing more in things than he himself has laid in them--this process of finding again is science, the actual process of laying a meaning in things, is art, religion, love, pride. In both, even if they are child's play, one should show good courage and one should plough ahead; on the one hand, to find again, on the other,--we are the other,--to lay a sense in things.

607.

Science: its two sides:--

In regard to the individual;

In regard to the complex of culture ("levels of culture")

--antagonistic valuation in regard to this and that side.

608.

The development of science tends ever more to transform the known into the unknown: its aim, however, is to do the _reverse,_ and it starts out with the instinct of tracing the unknown to the known.

In short, science is laying the road to _sovereign ignorance,_ to a feeling that "knowledge" does not exist at all, that it was merely a form of haughtiness to dream of such a thing; further, that we have not preserved the smallest notion which would allow us to class knowledge even as a _possibility_ that "knowledge" is a contradictory idea. We _transfer_ a primeval myth and piece of human vanity into the land of hard facts: we can _allow_ a thing-in-itself as a concept, just as little as we can _allow_ "knowledge-in-itself." The _misleading_ influence of "numbers and logic," the misleading influence of "laws."

Wisdom is an attempt to _overcome_ the perspective valuations (_i.e._ the "will to power"): it is a principle which is both unfriendly to Life, and also decadent; a symptom in the case of the Indians, etc.; _weakness_ of the power of appropriation.

609.

It does not suffice for you to see in what ignorance man and beast now live; you must also have and learn the _desire_ for _ignorance._ It is necessary that you should know that without this form of ignorance life itself would be impossible, that it is merely a vital condition under which, alone, a living organism can preserve itself and prosper: a great solid belt of ignorance must stand about you.

610.

Science--the transformation of Nature into concepts for the purpose of governing Nature--that is part of the rubric _means._

But the _purpose_ and _will_ of mankind must grow in the same way, the intention in regard to the whole.

611.

Thought is the strongest and most persistently exercised function in all stages of life--and also in every act of perception or apparent experience! Obviously it soon becomes the _mightiest_ and _most exacting_ of all functions, and in time tyrannises over other powers. Ultimately it becomes "passion in itself."

612.

The right to great passion must be reclaimed for the investigator, after self-effacement and the cult of "objectivity" have created a false order of rank in this sphere. Error reached its zenith when Schopenhauer taught: _in the release from passion and_ in will alone lay the road to "truth," to knowledge; the intellect freed from will _could not help_ seeing the true and actual essence of things. The same error in art: as if everything became _beautiful_ the moment it was regarded without will.

613.

The contest for supremacy among the passions, and the dominion of one of the passions over the intellect.

614.

To "humanise" the world means to feel ourselves ever more and more masters upon earth.

615.

Knowledge, among a higher class of beings, will also take new forms which are not yet necessary.

616.

That the _worth of the world_ lies in our interpretations (that perhaps yet other interpretations are possible somewhere, besides mankind's); that the interpretations made hitherto were perspective valuations, by means of which we were able to survive in life, _i.e._ in the Will to Power and in the growth of power; that every _elevation of man_ involves the overcoming of narrower interpretations; that every higher degree of strength or power attained, brings new views in its train, and teaches a belief in new horizons--these doctrines lie scattered through all my works. The world that _concerns us at all_ is false--that is to say, is not a fact; but a romance, a piece of human sculpture, made from a meagre sum of observation; it is "in flux"; it is something that evolves, a great revolving lie continually moving onwards and never getting any nearer to truth--for there is no such thing as "truth."

617.

Recapitulation:--

To _stamp_ Becoming with the character of Being--this is the highest _Will to Power._

The twofold falsification, by the senses on the one hand, by the intellect on the other, with the view of maintaining a world of being, of rest, of equivalent cases, etc.

That _everything recurs,_ is the very nearest _approach of a world of Becoming to a world of Being, the height of contemplation._

It is out of the values which have been attributed to Being, that the condemnation of, and dissatisfaction with, Becoming, have sprung: once such a world of Being had been invented.

The metamorphoses of Being (body, God, ideas, natural laws, formulæ, etc.).

"Being" as appearance the twisting round of values: appearance was that which _conferred the values._

Knowledge in itself in a world of Becoming is impossible; how can knowledge be possible at all, then? Only as a mistaking of one's self, as will to power, as will to deception.

Becoming is inventing, willing, self-denying, self-overcoming; no subject but an action, it places things, it is creative, no "causes and effects."

Art is the will to overcome Becoming, it is a process of eternalising, but short-sighted, always according to the perspective, repeating, as it were in a small way, the tendency of the whole.

That which _all life_ shows, is to be regarded as a reduced formula for the collective tendency: hence the new definition of the concept "Life" as "will to power."

Instead of "cause and effect," the struggle of evolving factors with one another, frequently with the result that the opponent is absorbed; no constant number for Becoming.

The uselessness of old ideals for the interpretation of all that takes place, once their bestial origin and utility have been recognised, they are, moreover, all hostile to life.

The uselessness of the mechanical theory--it gives the impression that there _can be no purpose._

All the _idealism_ of mankind, hitherto, is on the point of turning into _Nihilism_--may be shown to be a belief in absolute _worth_lessness, _i.e. purpose_lessness.

The annihilation of ideals, the new desert waste the new arts which will help us to endure it--_amphibia_ that we are!

First principles, bravery, patience, no "stepping-back," not too much ardour to get to the fore. (_N.B._--Zarathustra constantly maintaining an attitude of parody towards all former values, as the result of his overflowing energy.)

II.

THE WILL TO POWER IN NATURE.

1. The Mechanical Interpretation of the World.

618.

Of all the interpretations of the world attempted heretofore, the _mechanical_ one seems to-day to stand most prominently in the front. Apparently it has a clean conscience on its side; for no science believes inwardly in progress and success unless it be with the help of mechanical procedures. Every one knows these procedures: "reason" and "purpose" are allowed to remain out of consideration as far as possible; it is shown that, provided a sufficient amount of time be allowed to elapse, everything can evolve out of everything else, and no one attempts to suppress his malicious satisfaction, when the "apparent design in the fate" of a plant or of the yolk of an egg, may be traced to stress and thrust in short, people are heartily glad to pay respect to this principle of profoundest stupidity, if I may be allowed to pass a playful remark concerning these serious matters. Meanwhile, among the most select intellects to be found in this movement, some presentiment of evil, some anxiety is noticeable, as if the theory had a rent in it, which sooner or later might be its last: I mean the sort of rent which denotes the end of all balloons inflated with such theories.

Stress and thrust themselves cannot be "explained," one cannot get rid of the _actio in distans._ The belief even in the ability to explain is now lost, and people peevishly admit that one can only describe, not explain that the dynamic interpretation of the world, with its denial of "empty space" and its little agglomerations of atoms, will soon get the better of physicists: although in this way _Dynamis_ is certainly granted an inner quality.

619.

The triumphant concept "_energy_" with which our physicists created God and the world, needs yet to be completed: it must be given an inner will which I characterise as the "_Will to Power_"--that is to say, as an insatiable desire to manifest power; or the application and exercise of power as a creative instinct, etc. Physicists cannot get rid of the "_actio in distans_" in their principles; any more than they can a repelling force (or an attracting one). There is no help for it, all movements, all "appearances," all "laws" must be understood as _symptoms_ of an _inner_ phenomenon, and the analogy of man must be used for this purpose. It is possible to trace all the instincts of an animal to the will to power; as also all the functions of organic life to this one source.

620.

Has anybody ever been able to testify to a _force!_ No, but to _effects,_ translated into a completely strange language. Regularity in sequence has so spoilt us, _that we no longer wonder at the wonderful process._

621.

A force of which we cannot form any idea, is an empty word, and ought to have no civic rights in the city of science: and the same applies to the purely mechanical powers of attracting and repelling by means of which we can form an image of the world--no more!

622.

Squeezes and kicks are something incalculably recent, evolved and not primeval. They presuppose something which holds together and _can_ press and strike! But how could it hold together?

623.

There is nothing _unalterable_ in chemistry: this is only appearance, a mere school prejudice. We it was who _introduced_ the unalterable, taking it from metaphysics as usual, Mr. Chemist. It is a mere superficial judgment to declare that the diamond, graphite, and carbon are identical. Why? Simply because no loss of substance can be traced in the scales! Well then, at least they have something in common; but the work of the molecules in the process of changing from one form to the other, an action we can neither see nor weigh, is just exactly what makes one material something different--with specifically different qualities.

624.

Against the physical _atom._--In order to understand the world, we must be able to reckon it up; in order to be able to reckon it up, we must be aware of constant causes; but since we find no such constant causes in reality, we _invent_ them for ourselves and call them atoms. This is the origin of the atomic theory.

The possibility of calculating the world, the possibility of expressing all phenomena by means of formulæ--is that really "understanding"? What would be understood of a piece of music, if all that were calculable in it and capable of being expressed in formulas, were reckoned up?--Thus "constant causes", things, substances, something "unconditioned," were therefore _invented_;--what has been attained thereby?

625.

The mechanical concept of "movement" is already a translation of the original process into the _language of symbols of the eye and the touch._

The concept _atom,_ the distinction between the "seat of a motive force and the force itself," is a _language of symbols derived from our logical and physical world._

It does not lie within our power to alter our means of expression: it is possible to understand to what extend they are but symptomatic. To demand an _adequate means of expression is nonsense_: it lies at the heart of a language, of a medium of communication, to express _relation_ only.... The concept "truth" is _opposed to good sense._ The whole province of truth--_falseness_ only applies to the relations between beings, not to an "absolute." There is no such thing as a "being in itself" (_relations_ in the first place constitute being), any more than there can be "knowledge in itself."

626.

"_The feeling of force_ cannot proceed from movement: feeling in general cannot proceed from movement."

"Even in support of this, an apparent experience is the only evidence: in a substance (brain) feeling is generated through transmitted motion (stimuli). But generated? Would this show that the feeling did _not_ yet exist there _at all_? so that its appearance would _have_ to be regarded as the _creative act_ of the intermediary--motion? The feelingless condition of this substance is only an hypothesis! not an experience! Feeling, therefore is the _quality_ of the substance: there actually are substances that feel."

"Do we learn from certain substances that they have _no_ feeling? No, we merely cannot tell that they have any. It is impossible to seek the origin of feeling in non-sensitive substance."--_Oh what hastiness!_

627.

"To attract" and "to repel", in a purely mechanical sense, is pure fiction: a word. We cannot imagine an attraction without a _purpose.--_ Either the will to possess one's self of a thing, or the will to defend one's self from a thing or to repel it--_that_ we

"understand"; that would be an interpretation which we could use.

In short, the psychological necessity of believing in causality lies in the _impossibility of imagining a process without a purpose_: but of course this says nothing concerning truth or untruth (the justification of such a belief)! The belief in _causæ_ collapses with the belief in τ■λει (against Spinoza and his causationism).

628.

It is an illusion to suppose that something is _known,_ when all we have is a mathematical formula of what has happened; it is only _characterised, described;_ no more!

629.

If I bring a regularly recurring phenomenon into a formula, I have facilitated and shortened my task of characterising the whole phenomenon, etc. But I have not thereby ascertained a "law," I have only replied to the question: How is it that something recurs here? It is a supposition that the formula corresponds to a complex of really unknown forces and the discharge of forces; it is pure mythology to suppose that forces here obey a law, so that, as the result of their obedience, we have the same phenomenon every time.

630.

I take good care not to speak of chemical "_laws_": to do so savours of morality. It is much more a question of establishing certain relations of power: the stronger becomes master of the weaker, in so far as the latter cannot maintain its degree of independence,--here there is no pity, no quarter, and, still less, any observance of "law."

631.

The unalterable sequence of certain phenomena does not prove any "law," but a relation of power between two or more forces. To say, "But it is precisely this relation that remains the same!" is no better than saying, "One and the same force cannot be another force."--It is not a matter of _sequence,_ but a matter of _interdependence,_ a process in which the procession of moments do _not_ determine each other after the manner of cause and effect....

The separation of the "action" from the "agent"; of the phenomenon from the _worker_ of that phenomenon: of the process from one that is not process, but lasting, _substance,_ thing, body, soul, etc.; the attempt to understand a life as a sort of shifting of things and a changing of places; of a sort of "being" or stable entity: this ancient mythology established the belief in "cause and effect," once it had found a lasting form in the functions of speech and grammar.

632.

The "regularity" of a sequence is only a metaphorical expression, not a fact, just _as if_ a rule were followed here! And the same holds good of "conformity to law." We find a formula in order to express an ever-recurring kind of succession of phenomena: but that does not show that we have _discovered a law_; much less a force which is the cause of a recurrence of effects. The fact that something always happens thus or thus, is interpreted here as if a creature always acted thus or thus as the result of obedience to a law or to a lawgiver: whereas apart from the "law" it would be free to act differently. But precisely that inability to act otherwise might originate in the creature itself, it might be that it did not act thus or thus in response to a law, but simply because it was so constituted. It would mean simply: that something cannot also be something else; that it cannot be first this, and then something quite different; that it is neither free nor the reverse, but merely thus or thus. _The fault lies in thinking a subject into things._

633.

To speak of two consecutive states, the first as "cause," and the second as "effect," is false. The first state cannot bring about anything, the second has nothing effected in it.

It is a question of a struggle between two elements unequal in power: a new adjustment is arrived at, according to the measure of power each possesses. The second state is something fundamentally different from the first (it is not its effect): the essential thing Is, that the factors which engage in the struggle leave it with different quanta of power.

634.

A. criticism of Materialism.--Let us dismiss the two popular concepts, Necessity and Law, from this idea: the first introduces a false constraint, the second a false liberty into the world. "Things" do not act regularly, they follow no _rule:_ there are no things (that is our fiction); neither do they act in accordance with any necessity. There is no obedience here: for, the fact that _something is_ as it is, strong or weak, is not the result of obedience or of a rule or of a constraint....

The degree of resistance and the degree of superior power--this is the question around which all phenomena turn: if we, for our own purposes and calculations, know how to express this in formulas and "laws," all the better for us! But that does not mean that we have introduced any "morality" into the world, just because we have fancied it as obedient.

There are no laws: every power draws its last consequence at every moment. Things are calculable precisely owing to the fact that there is no possibility of their being otherwise than they are.

A quantum of power is characterised by the effect it produces and the influence it resists. The adiaphoric state which would be thinkable in itself, is entirely lacking. It is essentially a will to violence and a will to defend one's self against violence. It is not self-preservation: every atom exercises its influence over the whole of existence--it is thought out of existence if one thinks this radiation of will-power away. That is why I call it a quantum of "_Will to Power_"; with this formula one can express the character which cannot be abstracted in thought from mechanical order, without suppressing the latter itself in thought.

The translation of the world of effect into a _visible_ world--a world for the eye--is the concept "movement." Here it is always understood that _something_ has been moved,--whether it be the fiction of an atomic globule or even of the abstraction of the latter, the dynamic atom, something is always imagined that has an effect--that is to say, we have not yet rid ourselves of the habit into which our senses and speech inveigled us. Subject and object, an agent to the action, the action and that which does it separated: we must not forget that all this signifies no more than semeiotics and--nothing real. Mechanics as a teaching of _movement_ is already a translation of phenomena into man's language of the senses.

635.

We are in need of "unities" in order to be able to reckon: but this is no reason for supposing that "unities" actually _exist._ We borrowed the concept "unity" from our concept "ego,"--our very oldest article of faith. If we did not believe ourselves to be unities we should never have formed the concept "thing." Now--that is to say, somewhat late in the day, we are overwhelmingly convinced that our conception of the concept "ego" is no security whatever for a real entity. In order to maintain the mechanical interpretation of the world theoretically, we must always make the reserve that it is with fictions that we do so: the concept of _movement_ (derived from the language of our senses) and the concept of the _atom_ (= entity, derived from our psychical experience) are based upon a _sense-prejudice_ and a _psychological prejudice._

Mechanics formulates consecutive phenomena, and it does so semeiologically, in the terms of the senses and of the mind (that all influence is _movement_; that where there is movement something is at work moving): it does not touch the question of the causal force.

The _mechanical_ world is imagined as the eye and the sense of touch alone could imagine a world (as "moved"),--in such a way as to be calculable,--as to simulate causal entities "things" (atoms) whose effect is constant (the transfer of the false concept of subject to the concept atom).

The mixing together of the concept of numbers, of the concept of thing (the idea of subject), of the concept of activity (the separation of that which is the cause, and the effect), of the concept of movement: all these things are phenomenal; our eye and our _psychology_ are still in it all.

If we eliminate these adjuncts, nothing remains over but dynamic quanta, in a relation of tension to all other dynamic quanta: the essence of which resides in their relation to all other quanta, in their "influence" upon the latter. The will to power, not Being, not Becoming, but a _pathos_--is the elementary fact, from these first results a Becoming, an influencing....

636.

The physicists believe in a "true world" after their own kind; a fixed _systematising of atoms_ to perform necessary movements, and holding good equally of all creatures, so that, according to them, the "world of appearance" reduces itself to the side of general

and generally-needed Being, which is accessible to every one according to his kind (accessible and also adjusted,--made "subjective"). But here they are in error. The atom which they postulate is arrived at by the logic of that perspective of consciousness; it is in itself therefore a subjective fiction. This picture of the world which they project is in no way essentially different from the subjective picture: the only difference is, that it is composed simply with more extended senses, but certainly with _our_ senses.... And in the end, without knowing it, they left something out of the constellation: precisely the necessary _perspective factor,_ by means of which every centre of power--and not man alone--constructs the rest of the world _from its point of view_--that is to say, measures it, feels it, and moulds it according to its degree of strength.... They forgot to reckon with this perspective-fixing power, in "true being,"--or, in school-terms, subject-being. They suppose that this was "evolved" and added;--but even the chemical investigator needs it: it is indeed _specific Being,_ which determines action and reaction according to circumstances.

Perspectivity is only a complex form, of specificness. My idea is that every specific body strives to become master of all space, and to extend its power (its will to power), and to thrust back everything that resists it. But inasmuch as it is continually meeting the same endeavours on the part of other bodies, it concludes by coming to terms with those (by "combining" with those) which are sufficiently related to it--_and thus they conspire together for power._ And the process continues.

637.

Even in the inorganic world all that concerns an atom of energy is its immediate neighbourhood: distant forces balance each other. Here is the root of _perspectivity,_ and it explains why a living organism is "egoistic" to the core.

638.

Granting that the world disposed of a quantum of force, it is obvious that any transposition of force to any place would affect the whole system--thus, besides the causality of _sequence,_ there would also be a dependence, _contiguity,_ and _coincidence._

639.

The only possible way of upholding the sense of the concept "God" would be: to make _Him not_ the motive force, but the condition of _maximum power,_ an _epoch;_ a point in the further development of the _Will to Power;_ by means of which subsequent evolution just as much as former evolution--up to Him--could be explained.

Viewed mechanically, the energy of collective Becoming remains constant; regarded from the economical standpoint, it ascends to its zenith and then recedes therefrom in order to remain eternally rotatory. This "_Will to Power_" expresses itself in the _interpretation in the manner in which the strength is used._--The conversion of energy into life; "life in its highest power" thenceforward appears as the goal. The same amount of energy, at different stages of development, means different things.

That which determines growth in Life is the economy which becomes ever more sparing and methodical, which achieves ever more and more with a steadily decreasing amount of energy.... The ideal is the principle of the least possible expense....

The only thing _that is proved_ is that the world is _not_ striving towards a state of stability. Consequently its zenith must not be conceived as a state of absolute equilibrium....

The dire necessity of the same things happening in the course of the world, as in all other things, is not an eternal determinism reigning over all phenomena, but merely the expression of the fact that the impossible is not possible; that a given force cannot be different from that given force; that a given quantity of resisting force does not manifest itself otherwise than in conformity with its degree of strength;--to speak of events as being necessary is tautological.

2. The Will to Power as Life.

(a) The Organic Process.

640.

Man imagines that he was present at the generation of the organic world: what was there to be observed, with the eyes and the touch, in regard to these processes? How much of it can be put into round numbers? What rules are noticeable in the movements? Thus, man would fain arrange all phenomena as if they were _for the eye and for the touch,_ as if they were forms of motion: he will

discover _formules_ wherewith to _simplify_ the unwieldy mass of these experiences.

The reduction of all phenomena to the level of men with senses and with mathematics. It is a matter of making _an inventory of human experiences:_ granting that man, or rather the _human eye and the ability to form concepts,_ have been the eternal witnesses of all things.

641.

A plurality of forces bound by a common nutritive process we call "Life." To this nutritive process all so-called feeling, thinking, and imagining belong as means--that is to say, (1) in the form of opposing other forces; (2) in the form of an adjustment of other forces according to mould and rhythm; (3) the form of a valuation relative to assimilation and excretion.

642.

The bond between the inorganic and the organic world must lie in the repelling power exercised by every atom of energy. "Life" might be defined as a lasting form of _force-establishing processes,_ in which the various contending forces, on their part, grow unequally. To what extent does counter-strife exist even in obedience? Individual power is by no means surrendered through it. In the same way, there exists in the act of commanding, an acknowledgment of the fact that the absolute power of the adversary has not been overcome, absorbed, or dissipated. "Obedience," and "command," are forms of the game of war.

643.

The Will to Power _interprets_ (an organ in the process of formation has to be interpreted): it defines, it determines gradations, differences of power. Mere differences of power could not be aware of each other as such: something must be there which _will_ grow, and which interprets all other things that would do the same, according to the value of the latter. In sooth, all interpretation is but a means in itself to become master of something. (Continual _interpretation_ is the first principle of the organic process.)

644.

Greater complexity, sharp differentiation, the contiguity of the developed organs and functions, with the disappearance of intermediate members--if _that_ is _perfection,_ then there is a Will to Power apparent in the organic process by means of whose _dominating, shaping,_ and _commanding_ forces it is continually increasing the sphere of its power, and persistently simplifying things within that sphere, it _grows_ imperatively.

"Spirit" is only a means and an instrument in the service of higher life, in the service of the elevation of life.

645.

"_Heredity,_" as something quite incomprehensible, cannot be used as an explanation, but only as a designation for the identification of a problem. And the same holds good of "_adaptability._" As a matter of fact, the account of morphology, even supposing it were perfect, _explains_ nothing, it merely describes an enormous fact. _How_ a given organ gets to be used for any particular purpose is not explained. There is just as little explained in regard to these things by the assumption of _causæ finales_ as by the assumption of _causæ efficientes._ The concept "causa" is only a means of expression, no _more_; a means of designating a thing.

646.

They are analogies; for instance, our _memory_ may suggest another kind of memory which makes itself felt in heredity, development, and forms. Our _inventive_ and experimentative powers suggest another kind of inventiveness in the application of instruments to new ends, etc.

That which we call our "_consciousness_" is quite guiltless of any of the essential processes of our preservation and growth; and no human brain could be so subtle as to construct anything more than a machine--to which every organic process is infinitely superior.

647.

Against Darwinism.--The use of an organ does _not_ explain its origin, on the contrary! During the greater part of the time occupied in the formation of a certain quality, this quality does not help to preserve the individual; it is of no use to him, and particularly not in his struggle with external circumstances and foes.

What is ultimately "useful"? It is necessary to ask, "Useful for what"?

For instance, that which promotes the _lasting powers_ of the individual might be unfavourable to his strength or his beauty; that which preserves him might at the same time fix him and keep him stable throughout development. On the other hand, a _deficiency,_ a state of _degeneration,_ may be of the greatest possible use, inasmuch as it acts as a stimulus to other organs. In the same way, a _state of need_ may be a condition of existence, inasmuch as it reduces an individual to that modicum of means which, though it _keeps him together,_ does not allow him to squander his strength.--The individual himself is the struggle of parts (for nourishment, space, etc.): his development involves the _triumph,_ the _predominance,_ of isolated parts; the _wasting away,_ or the "development into organs," of other parts.

The influence of "environment" is nonsensically _overrated_ in Darwin, the essential factor in the process of life is precisely the tremendous inner power to shape and to create forms, which merely _uses, exploits_ "environment."

The new forms built up by this inner power are not produced with a view to any end; but, in the struggle between the parts, a new form does not exist long _without_ becoming related to some kind of semi-utility, and, according to its use, develops itself ever more and more perfectly.

648.

"Utility" in respect of the acceleration of the speed of evolution, is a different kind of "utility" from that which is understood to mean the greatest possible stability and staying power of the evolved creature.

649.

"Useful" in the sense of Darwinian biology means: that which favours a thing in its struggle with others. But in my opinion the _feeling of being surcharged,_ the feeling accompanying an _increase in strength,_ quite apart from the utility of the struggle, is the actual _progress_: from these feelings the will to war is first derived.

650.

Physiologists should bethink themselves before putting down the instinct of self-preservation as the cardinal instinct of an organic being. A living thing seeks above all to _discharge_ its strength: "_self-preservation" _ is only one of the results thereof.--Let us beware of _superfluous_ teleological principles!--one of which is the whole concept of "self-preservation."[4]

[Footnote 4: See _Beyond Good and Evil,_ in this edition, Aph. 13.]

651.

The most-fundamental--and most primeval activity of a protoplasm cannot be ascribed to a will to self-preservation, for it absorbs an amount of material which is absurdly out of proportion with the needs of its preservation: and what is more, it does _not_ "preserve itself" in the process, but actually falls to _pieces...._ The instinct which rules here, must account for this total absence in the organism of a desire to preserve itself: hunger is already an interpretation based upon the observation of a more or less complex organism (hunger is a specialised and later form of the instinct; it is an expression of the system of divided labour, in the service of a higher instinct which rules the whole).

652.

It is just as impossible to regard _hunger_ as the _primum mobile,_ as it is to take self-preservation to be so. Hunger, considered as the result of insufficient nourishment, means hunger as the result of a will to power _which can no longer dominate_ It is not a question of replacing a loss, it is only later on, as the result of the division of labour, when the Will to Power has discovered other and quite different ways of gratifying itself, that the appropriating lust of the organism is _reduced_ to hunger--to the need of replacing what has been lost.

653.

We can but laugh at the false "_Altruism_" of biologists: propagation among the amœbæ appears as a process of jetsam, as an advantage to them. It is an excretion of useless matter.

654.

The division of a protoplasm into two takes place when its power is no longer sufficient to subjugate the matter it has appropriated: procreation is the result of impotence.

In the cases in which the males seek the females and become one with them, procreation is the result of hunger.

655.

The weaker vessel is driven to the stronger from a need of nourishment; it desires to get under it, if possible to become _one_ with it. The stronger, on the contrary, defends itself from others; it refuses to perish in this way; it prefers rather to split itself into two or more parts in the process of growing. One may conclude that the greater the urgency seems to become one with something else, the more weakness in some form is present. The greater the tendency to variety, difference, inner decay, the more strength is actually to hand.

The instinct to cleave to something, and the instinct to repel something, are in the inorganic as in the organic world, the uniting bond. The whole distinction is a piece of hasty judgment.

The will to power in every combination of forces, _defending itself against the stronger and coming down unmercifully upon the weaker, is more correct._

N. B. _All processes may be regarded as "beings"._

656.

The will to power can manifest itself only against _obstacles;_ it therefore goes in search of what resists it--this is the primitive tendency of the protoplasm when it extends its _pseudopodia_ and feels about it. The act of appropriation and assimilation is, above all, the result of a desire to overpower, a process of forming, of additional building and rebuilding, until at last the subjected creature has become completely a part of the superior creature's sphere of power, and has increased the latter.--If this process of incorporation does not succeed, then the whole organism falls to pieces; and the _separation_ occurs as the result of the will to power: in order to prevent the escape of that which has been subjected, the will to power falls into two wills (under some circumstances without even abandoning completely its relation to the two).

"Hunger" is only a more narrow adaptation, once the fundamental instinct of power has won power of a more abstract kind.

657.

What is "passive"?

To be hindered in the outward movement of grasping: it is thus an act of resistance and reaction.

What is "active"?

To stretch out for power.

"Nutrition"...

Is only a derived phenomenon; the primitive form of it was the will to stuff everything inside one's own skin.

"Procreation"...

Only derived; originally, in those cases In which one will was unable to organise the collective mass it had appropriated, an _opposing will_ came into power, which undertook to effect the separation and establish a new centre of organisation, after a struggle with the original will.

"Pleasure"...

Is a feeling of power (presupposing the existence of pain).

658.

(1) The organic functions shown to be but forms of the fundamental will, the will to power,--and buds thereof.

(2) The will to power specialises itself as will to nutrition, to property, to _tools,_ to servants (obedience), and to rulers: the body as an example.--The stronger will directs the weaker. There is no other form of causality than that of will to will. It is not to be explained mechanically.

(3) Thinking, feeling, willing, in all living organisms. What is a desire if it be not: a provocation of the feeling of power by an obstacle (or, better still, by rhythmical obstacles and resisting forces)--so that it surges through it? Thus in all pleasure pain is understood.--If the pleasure is to be very great, the pains preceding it must have been very long, and the whole bow of life must have been strained to the utmost.

(4) Intellectual functions. The will to shaping, forming, and making like, etc.

(b) Man.

659.

With the body as clue.--Granting that the "_soul_" was only an attractive and mysterious thought, from which philosophers rightly, but reluctantly, separated themselves--that which they have since learnt to put in its place is perhaps even more attractive and even more mysterious. The human _body,_ in which the whole of the most distant and most recent past of all organic life once more becomes living and corporal, seems to flow through, this past and right over it like a huge and inaudible torrent; the body is a more wonderful thought than the old "soul." In all ages the body, as our actual property, as our most certain being, in short, as our ego, has been more earnestly believed in than the spirit (or the "soul," or the subject, as the school jargon now calls it). It has never occurred to any one to regard his stomach as a strange or a divine stomach; but that there is a tendency and a predilection in man to regard all his thoughts as "inspired," all his values as "imparted to him by a God," all his instincts as dawning activities--this is proved by the evidence of every age in man's history. Even now, especially among artists, there may very often be noticed a sort of wonder, and a deferential hesitation to decide, when the question occurs to them, by what means they achieved their happiest work, and from which world the creative thought came down to them: when they question in this way, they are possessed by a feeling of guilelessness and childish shyness. They dare not say: "That came from me; it was my hand which threw that die." Conversely, even those philosophers and theologians, who in their logic and piety found the most imperative reasons for regarding their body as a deception (and even as a deception overcome and disposed of), could not help recognising the foolish fact that the body still remained: and the most unexpected proofs of this are to be found partly in Pauline and partly in Vedantic philosophy. But what does _strength of faith_ ultimately mean? Nothing!--A strong faith might also be a foolish faith!--There is food for reflection.

And supposing the faith in the body were ultimately but the result of a conclusion; supposing it were a false conclusion, as idealists declare it is, would it not then involve some doubt concerning the trustworthiness of the spirit itself which thus causes us to draw wrong conclusions?

Supposing the plurality of things, and space, and time, and motion (and whatever the other first principles of a belief in the body may be) were errors--what suspicions would not then be roused against the spirit which led us to form such first principles? Let it suffice that the belief in the body is, at any rate for the present, a much stronger belief than the belief in the spirit, and he who would fain undermine it assails the authority of the spirit most thoroughly in so doing!

660.

The Body as an Empire.

The aristocracy in the body, the majority of the rulers (the fight between the cells and the tissues).

Slavery and the division of labour: the higher type alone possible through the _subjection_ of the lower to a function.

Pleasure and pain, not contraries. The feeling of power.

"Nutrition" only a result of the insatiable lust of appropriation in the Will to Power.

"Procreation": this is the decay which supervenes when the ruling cells are too weak to organise appropriated material.

It is the _moulding_ force which will have a continual supply of new material (more "force"). The masterly construction of an organism out of an egg.

"The mechanical interpretation": recognises only quantities: but the real energy is in the quality. Mechanics can therefore only describe processes; it cannot explain them.

"Purpose." We should start out from the "sagacity" of plants.

The concept of "meliorism": _not_ only greater complexity, but greater _power_ (it need not be only greater masses).

Conclusion concerning the evolution of man: the road to perfection lies in the bringing forth of the most powerful individuals, for whose use the great masses would be converted into mere tools (that is to say, into the most intelligent and flexible tools possible).

661.

Why is all _activity,_ even that of a _sense,_ associated with pleasure? Because, before the activity was possible, an obstacle or a burden was done away with. Or, rather, because all action is a process of overcoming, of becoming master of, and of _increasing_ the _feeling of power_? The pleasure of thought. Ultimately it is not only the feeling of power, but also the pleasure of creating and of contemplating the _creation:_ for all activity enters our consciousness in the form of "works."

662.

Creating is an act of selecting and of finishing the thing selected. (In every act of the will, this is the essential element.)

663.

All phenomena which are the result of intentions may be reduced to _the intention of increasing power._

664.

When we do anything, we are conscious of a _feeling of strength;_ we often have this sensation before the act--that is to say, while imagining the thing to do (as, for instance, at the sight of an enemy, of an obstacle, which we feel _equal to_): it is always an accompanying sensation. Instinctively we think that this feeling of strength is the cause of the action, that it is the "motive force." Our belief in causation is the belief in force and its effect; it is a transcript of our experience: in which we identify force and the feeling of force.--Force, however, never moves things; the strength which is conscious "does not set the muscles moving." "Of such a process we have no experience, no idea." "We experience as little concerning force as a motive power, as concerning the _necessity_ of a movement." Force is said to be the constraining element! "All we know is that one thing follows another;--we know nothing of either compulsion or arbitrariness in regard to the one following the other. Causality is first invented by thinking compulsion into the sequence of processes. A certain "understanding" of the thing is the result--that is to say, we humanise the process a little, we make it more "familiar"; the familiar is the known habitual fact of _human compulsion associated with the feeling of force._

665.

I have the intention of extending my arm; taking it for granted that I know as little of the physiology of the human body and of the mechanical laws of its movements as the man in the street, what could there be more vague, more bloodless, more uncertain than this intention compared with what follows it? And supposing I were the astutest of mechanics, and especially conversant with the formulæ which are applicable in this case, I should not be able to extend my arm one whit the better. Our "knowledge" and our "action" in this case lie coldly apart: as though in two different regions.--Again: Napoleon carries out a plan of campaign--what does that mean? In this case, everything concerning the consummation of the campaign is _known,_ because everything must be done through words of command: but even here subordinates are taken for granted, who apply and adapt the general plan to the particular emergency, to the degree of strength, etc.

666.

For ages we have always ascribed the value of an action, of a character, of an existence, to the _intention,_ to the _purpose_ for which it was done, acted, or lived: this primeval idiosyncrasy of taste ultimately takes a dangerous turn provided the lack of intention and purpose in all phenomena comes ever more to the front in consciousness. With it a general depreciation of all values seems to be preparing: "All is without sense."--This melancholy phrase means: "All sense lies in the intention, and if the intention is absolutely lacking, then sense must be lacking too." In conformity with this valuation, people were forced to place the value of life in a a life after death, or in the progressive development of ideas, or of mankind, or of the people, or of man to superman; but in this way the _progressus in infinitum_ of purpose had been reached: it was ultimately necessary to find one's self a place in the process of the world (perhaps with the disdæmonistic outlook, it was a process which led to nonentity).

In regard to this point, "_purpose_" needs a somewhat more severe criticism: it ought to be recognised that an action _is never caused by a purpose;_ that an object and the means thereto are interpretations, by means of which certain points in a phenomena are selected and accentuated, at the cost of other, more numerous, points, that every time something is done for a purpose, something fundamentally different, and yet other things happen; that in regard to the action done with a purpose, the case is the same as with the so-called purposefulness of the heat which is radiated from the sun: the greater part of the total sum is squandered; a portion of it, which is scarcely worth reckoning, has a "purpose," has "sense"; that an "end" with its "means" is an absurdly indefinite description, which indeed may be able to command as a precept, as "will," but presupposes a system of obedient and trained instruments, which, in the place of the indefinite, puts forward a host of determined entities _(i.e._ we imagine a system of _clever_ but narrow intellects who postulate end and means, in order to be able to grant our only known "end," the rôle of the "cause of an action,"--a proceeding to which we have no right: it is tantamount to solving a problem by placing its solution in an inaccessible world which we cannot observe).

Finally, why could not an "end" be merely an _accompanying feature_ in the series of changes among the active forces which bring about the action--a pale stenographic symbol stretched in consciousness beforehand, and which serves as a guide to what happens, even as a symbol of what happens, _not_ as its cause?--But in this way we criticise _will_ itself: is it not an illusion to regard that which enters consciousness as will-power, as a cause? Are not all conscious phenomena only final phenomena--the lost links in a chain, but apparently conditioning one another in their sequence within the plane of consciousness? This might be an illusion.

667.

Science does _not_ inquire what impels us to will: on the contrary, it _denies_ that _willing_ takes place at all, and supposes that something quite different has happened--in short, that the belief in "will" and "end" is an illusion. It does not inquire into the _motives_ of an action, as if these had been present in consciousness previous to the action, but it first divides the action up into a group of phenomena, and then seeks the previous history of this mechanical movement--but _not_ in the terms of feeling, perception, and thought; from this quarter it can never accept the explanation: perception is precisely the matter of science, _which has to be explained._--The problem of science is precisely to explain the world, _without_ taking perceptions as the cause: for that would mean regarding _perceptions_ themselves as the _cause_ of perceptions. The task of science is by no means accomplished.

Thus: either there is _no_ such thing as will,--the hypothesis of science,--or the will is _free_. The latter assumption represents the prevailing feeling, of which we cannot rid ourselves, even if the hypothesis of science were _proved._

The popular belief in cause and effect is founded on the principle that free will _is the cause of every effect:_ thereby alone do we arrive at the feeling of causation. And thereto belongs also the feeling that every cause is _not_ an effect, but always only a cause--if will is the cause. "Our acts of will are _not necessary_"--this lies in the very _concept of "will."_ The effect necessarily comes _after_ the cause--that is what we feel. It is merely a _hypothesis_ that even our willing is compulsory in every case.

668.

"To will" is not "to desire," to strive, to aspire to; it distinguishes itself from that through the _passion of commanding._

There is no such thing as "willing," but only the willing of _something:_ the _aim_ must not be severed from the state--as the epistemologists sever it. "Willing," as they understand it, is no more possible than "thinking": it is a pure invention.

It is essential to willing that something should be _commanded_ (but that does not mean that the will is carried into effect).

The general _state of tension,_ by virtue of which a force seeks to discharge itself, is not "willing."

669.

"Pain" and "pleasure" are the most absurd _means of expressing_ judgments, which of course does not mean that the judgments which are enunciated in this way must necessarily be absurd. The elimination of all substantiation and logic, a yes or no in the reduction to a passionate desire to have or to reject, an imperative abbreviation, the utility of which is irrefutable: that is pain and pleasure. Its origin is in the central sphere of the intellect; its prerequisite is an infinitely accelerated process of perceiving, ordering, co-ordinating, calculating, concluding: pleasure and pain are always final phenomena, they are never causes.

As to deciding what provokes pain and pleasure, that is a question which depends upon the _degree of power:_ the same thing, when confronted with a small quantity of power, may seem a danger and may suggest the need of speedy defence, and when confronted with the consciousness of greater power, may be a voluptuous stimulus and may be followed by a feeling of pleasure.

All feelings of pleasure and pain presuppose a _measuring of collective utility_ and _collective harmfulness_: consequently a sphere where there is the willing of an object (of a condition) and the selection of the means thereto. Pleasure and pain are never "original facts."

The feelings of pleasure and pain are _reactions of the will_ (emotions) in which the intellectual centre fixes the value of certain supervening changes as a collective value, and also as an introduction of contrary actions.

670.

The belief in "emotions"--Emotions are a fabrication of the intellect, an invention of _causes_ which do not exist. All general _bodily sensations_ which we do not understand are interpreted intellectually--that is to say, a _reason_ is sought why we feel thus or thus among certain people or in certain experiences. Thus something disadvantageous dangerous, and strange is taken for granted, as if it were the cause of our being indisposed; as a matter of fact, it gets _added to_ the indisposition, so as to make our condition thinkable.--Mighty rushes of blood to the brain, accompanied by a feeling of suffocation, are _interpreted_ as anger: the people and things which provoke our anger are a means of relieving our physiological condition. Subsequently, after long habituation, certain processes and general feelings are so regularly correlated that the sight of certain processes provokes that condition of general feeling, and induces vascular engorgements, the ejection of seminal fluid, etc.: we then say that the "emotion is provoked by propinquity."

Judgments already inhere in pleasure and pain: stimuli become differentiated, according as to whether they increase or reduce the feeling of power.

The belief in willing. To believe that a thought may be the cause of a mechanical movement is to believe in miracles. The _consistency of science_ demands that once we have made the world _thinkable_ for ourselves by means of pictures, we should also make the emotions, the desires, the will, etc., _thinkable_--that is to say, we should _deny_ them and treat them as _errors of the intellect._

671.

Free will or no free will?--There is _no such thing_ as "_Will_": that is only a simplified conception on the part of the understanding, like "matter."

All actions must first be prepared and made possible mechanically before they can be willed. Or, _in most cases_ the "_object_" of an action enters the brain only after everything is prepared for its accomplishment. The object is an inner "stimulus"--nothing _more._

672.

The most proximate prelude to an action relates to that action: but _further back still_ there lies a preparatory history which covers _a far wider field:_ the individual action is only a factor in a much more extensive and _subsequent_ fact. The shorter and the longer processes are not reported.

673.

The theory of _chance:_ the soul is a selecting and self-nourishing being, which is persistently extremely clever and creative (this _creative_ power is commonly overlocked! it is taken to be merely passive).

I recognised the _active_ and creative _power_ within the accidental.--Accident is in itself nothing more than _the clashing of creative impulses._

674.

Among the enormous multiplicity of phenomena to be observed in an organic being, that part which becomes _conscious_ is a mere means: and the particle of "virtue," "self abnegation," and other fanciful inventions, are denied in a most thoroughgoing manner by the whole of the remaining phenomena. We would do well to study our organism in all its immorality....

The animal functions are, as a matter of fact, a million times more important than all beautiful states of the soul and heights of consciousness: the latter are an overflow, in so far as they are not needed as instruments in the service of the animal functions. The whole of _conscious_ life: the spirit together with the soul, the heart, goodness, and virtue; in whose service does it work? In the greatest possible perfection of the means (for acquiring nourishment and advancement) serving the fundamental animal functions: above all, the _ascent of the line of Life._

That which is called "flesh" and "body" is of such incalculably greater importance, that the rest is nothing more than a small appurtenance. To continue the chain of life _so that it becomes ever more powerful_--that is the task.

But now observe how the heart, the soul, virtue, and spirit together conspire formally to thwart this purpose: as _if they_ were the object of every endeavour! ... The _degeneration of life_ is essentially determined by the extraordinary _fallibility of consciousness,_ which is held at bay least of all by the instincts, and thus commits the gravest and profoundest _errors._

Now could any more insane extravagance of vanity be imagined than to measure the _value_ of existence according to the _pleasant or unpleasant feelings of this consciousness_? It is obviously only a means: and pleasant or unpleasant feelings are also no more than means.

According to what standard is the objective value measured? According to the quantity of _increased_ and _more organised power_ alone.

675.

The value of all _valuing._--My desire would be to see the agent once more identified with the action, after action has been deprived of all meaning by having been separated in thought from the agent; I should like to see the notion of doing _something,_ the idea of a "purpose," of an "intention," of an object, reintroduced into the action, after action has been made insignificant by having been artificially separated from these things.

All "objects," "purposes," "meanings," are only manners of expression and metamorphoses of the one will inherent in all phenomena; of the will to power. To have an object, a purpose, or an intention, in fact _to will_ generally, is equivalent to the desire for _greater strength,_ for fuller growth, and for the _means_ thereto _in addition._

The most general and fundamental instinct in all action and willing is precisely on that account the one which is least known and is most concealed; for in practice we always follow its bidding, for the simple reason that we _are_ in ourselves its bidding....

All valuations are only the results of, and the narrow points of view in _servings this_ one will: valuing _in itself_ is nothing save this, _--will to power._

To criticise existence from the standpoint of any one of these values is utter nonsense and error. Even supposing that a process of annihilation follows from such a value, even so this process is in the service of this will.

The _valuation of existence itself!_ But existence is this valuing itself!--and even when we say "no," we still do what we _are._

We ought now to perceive the _absurdity_ of this pretence at judging existence; and we ought to try and discover _what_ actually takes place there. It is symptomatic.

676.

Concerning the Origin of our Valuations.

We are able to analyse our body, and by doing so we get the same idea of it as of the stellar system, and the differences between organic and inorganic lapses. Formerly the movements of the stars were explained as the effects of beings consciously pursuing a purpose: this is no longer required, and even in regard to the movements of the body and its changes, the belief has long since been abandoned that they can be explained by an appeal to a consciousness which has a determined purpose. By far the greater number of movements have nothing to do with consciousness at all: _neither have they anything to do with sensation._ Sensations and thoughts are extremely _rare_ and _insignificant_ things compared with the innumerable phenomena occurring every second.

On the other hand, we believe that a certain conformity of means to ends rules over the very smallest phenomenon, which it is quite beyond our deepest science to understand; a sort of cautiousness, selectiveness, co-ordination, and repairing process, etc. In short, we are in the presence of an _activity_ to which it would be necessary to ascribe an _incalculably higher and more extensive intellect_ than the one we are acquainted with. We learn to _think less of_ all that is conscious: we unlearn the habit of making ourselves responsible for ourselves, because, as conscious beings fixing purposes, we are but the smallest part of ourselves.

Of the numerous influences taking effect every second, for instance, air, electricity, we feel scarcely anything at all. There might be a number of forces, which, though they never make themselves felt by us, yet influence us continually. Pleasure and pain are very rare and scanty phenomena, compared with the countless stimuli with which a cell or an organ operates upon another cell or organ.

It is the phase of the _modesty of consciousness._ Finally, we can grasp the conscious ego itself, merely as an instrument in the service of that higher and more extensive intellect: and then we may ask whether all conscious _willing,_ all conscious _purposes,_ all _valuations,_ are not perhaps only means by virtue of which something essentially _different is attained,_ from that which consciousness supposes. We _mean_: it is a question of our _pleasure_ and _pain_ but pleasure and pain might be the means whereby we _had something to do_ which lies outside our consciousness.

This is to show how very _superficial_ all conscious phenomena really are; how an action and the image of it differ; how _little_ we know about what _precedes_ an action; how fantastic our feelings, "freewill," and "cause and effect" are; how thoughts and images, just like words, are only signs of thoughts; the impossibility of finding the grounds of any action; the superficiality of all praise and blame; how _essentially our_ conscious life is composed of _fancies_ and _illusion_; how all our words merely stand for fancies (our emotions too), and how the _union of mankind_ depends upon the transmission and continuation of these fancies: whereas, at bottom, the real union of mankind by means of procreation pursues its unknown way. Does this belief in the common fancies of men really _alter_ mankind? Or is the whole body of ideas and valuations only an expression in itself of unknown changes? _Are there_ really such things as will, purposes, thoughts, values? Is the whole of conscious life perhaps no more than _mirage_? Even when values seem to _determine_ the actions of a man, they are, as a matter of fact, doing something quite different! In short, granting that a certain conformity of means to end might be demonstrated in the action of nature, without the assumption of a ruling ego: could not _our_ notion of purposes, and our will, etc., be only a _symbolic language_ standing for something quite different--that is to say, something not-willing and unconscious? only the thinnest semblance of that natural conformity of means to end in the organic world, but not in any way different therefrom?

Briefly, perhaps the whole of mental development is a matter of the _body:_ it is the consciously recorded history of the fact that a _higher body is forming._ The organic ascends to higher regions. Our longing to know Nature is a means by virtue of which the body would reach perfection. Or, better still, hundreds of thousands of experiments are made to alter the nourishment and the mode of living of the _body_: the body's consciousness and valuations, its kinds of pleasure and pain, are _signs of these changes and experiments. In the end, it is not a question concerning man; for he must be surpassed._

677.

To what Extent are all Interpretations of the World Symptoms of a Ruling Instinct.

The _artistic_ contemplation of the world: to sit before the world and to survey it. But here the analysis of æsthetical contemplation, its reduction to cruelty, its feeling of security, its judicial and detached attitude, etc., are lacking. The artist himself must be taken, together with his psychology (the criticism of the instinct of play, as a discharge of energy, the love of change, the love of bringing one's soul in touch with strange things, the absolute egoism of the artist, etc.). What instincts does he sublimate?

The _scientific_ contemplation of the world: a criticism of the psychological longing for science, the desire to make everything comprehensible; the desire to make everything practical, useful, capable of being exploited--to what extent this is anti-æsthetic. Only that value counts, which may be reckoned in figures. How it happens that a mediocre type of man preponderates under the influence of science. It would be terrible if even history were to be taken possession of in this way--the realm of the superior, of the judicial. What instincts are here sublimated!

The religious contemplation of the world: a criticism of the religious man. It is not necessary to take the moral man as the type, but the man who has extreme feelings of exaltation and of deep depression, and who interprets the former with thankfulness or suspicion without, however, seeking their origin in _himself_ (nor the latter either). The man who essentially feels anything but free, who sublimates his conditions and states of submission.

The _moral_ contemplation of the world. The feelings peculiar to certain social ranks are projected into the universe: stability, law, the making of things orderly, and the making of things alike, are _sought_ in the highest spheres, because they are valued most highly,--above everything or behind everything.

What is _common_ to all: the ruling instincts _wish to be regarded_ as _the highest values in general,_ even as the _creative_ and _ruling powers._ It is understood that these instincts either oppose or overcome each other (join up synthetically, or alternate in power). Their profound antagonism is, however, so great, that in those cases in which they _all_ insist upon being gratified, a man of very thorough _mediocrity_ is the outcome.

678.

It is a question whether the origin of our apparent "knowledge" is not also a mere offshoot of our _older valuations,_ which are so completely assimilated that they belong to the very basis of our nature. In this way only _the more recent_ needs engage in battle _with results of the oldest needs._

The world is seen, felt, and interpreted thus and thus, in order that organic life may be preserved with this particular manner of interpretation. Man is _not_ only an individual, but the continuation of collective organic life in one definite line. The fact that _man_ survives, proves that a certain species of interpretations (even though it still be added to) has also survived; that, as a system, this method of interpreting has not changed. "Adaptation."

Our "dissatisfaction," our "ideal," etc., may possibly be the _result_ of this incorporated piece of interpretation, of our particular point of view: the organic world may ultimately perish owing to it just as the division of labour in organisms may be the means of bringing about the ruin of the whole, if one part happen to wither or weaken. The _destruction_ of organic life, and even of the highest form thereof, must follow the same principles as the destruction of the individual.

679.

Judged from the standpoint of the theory of descent, _individuation_ shows the continuous breaking up of one into two, and the equally continuous annihilation of individuals _for the sake of a few_ individuals, which evolution bears onwards; the greater mass always perishes ("the body").

The fundamental phenomena: _innumerable individuals are sacrificed for the sake of a few,_ in order to make the few possible.--One must not allow one's self to be deceived; the case is the same with _peoples_ and _races_: they produce the "body" for the generation of isolated and valuable _individuals,_ who continue the great process.

680.

I am opposed to the theory that the individual studies the interests of the _species,_ or of posterity, at the cost of his own advantage: all this is only apparent.

The excessive importance which he attaches to the _sexual instinct_ is not the _result_ of the latter's importance to the species, for procreation is the actual performance of the individual, it is his greatest interest, and therefore it is his _highest expression of power_ (not judged from the standpoint of consciousness, but from the very centre of the individual).

681.

The _fundamental errors_ of the biologists who have lived hitherto: it is not a matter of the species, but of rearing stronger individuals (the many are only a means).

Life is _not_ the continuous adjustment of internal relations to external relations, but will to power, which, proceeding from inside, subjugates and incorporates an ever-increasing quantity of "external" phenomena.

These biologists _continue_ the moral valuations ("the absolutely higher worth of Altruism," the antagonism towards the lust of dominion, towards war, towards all that which is not useful, and towards all order of rank and of class).

682.

In natural science, the moral depreciation of the _ego_ still goes hand in hand with the overestimation of the _species._ But the species is quite as illusory as the ego: a false distinction has been made. The ego is a hundred times _more_ than a mere unit in a chain of creatures; it is the chain _itself,_ in every possible respect, and the species is merely an abstraction suggested by the multiplicity and partial similarity of these chains. That the individual is _sacrificed_ to the species, as people often say he is, is not a fact at all: it is rather only an example of false interpretation.

683.

The formula of the _"progress"-superstition_ according to a famous physiologist of the cerebral regions:--

"L'animal ne fait jamais de progrès comme espèce. L'homme seul fait de progrès comme espèce."

No.

684.

Anti-Darwin.--The _domestication of man:_ what definite value can it have, or has domestication in itself a definite value?--There are reasons for denying the latter proposition.

Darwin's school of thought certainly goes to great pains to convince us of the reverse: it would fain prove that the influence of domestication may be profound and fundamental. For the time being, we stand firmly as we did before; up to the present no results save very superficial modification or degeneration have been shown to follow upon domestication. And everything that escapes from the hand and discipline of man, returns almost immediately to its original natural condition. The type remains constant, man cannot "_dénaturer la nature_."

Biologists reckon upon the struggle for existence, the death of the weaker creature and the survival of the most robust, most gifted combatant; on that account they imagine a _continuous increase in the perfection of all creatures._ We, on the contrary, have convinced ourselves of the fact, that in the struggle for existence, accident serves the cause of the weak quite as much as that of the strong; that craftiness often supplements strength with advantage; that the _prolificness_ of a species is related in a remarkable manner to that species _chances of destruction_....

Natural Selection is also credited with the power of slowly effecting unlimited metamorphoses: it is believed that every advantage is transmitted by heredity, and strengthened in the course of generations (when heredity is known to be so capricious that ...); the happy adaptations of certain creatures to very special conditions of life, are regarded as the result of _surrounding influences._ Nowhere, however, are examples of _unconscious selection_ to be found (absolutely nowhere). The most different individuals associate one with the other; the extremes become lost in the mass. Each vies with the other to maintain his kind; those creatures whose appearance shields them from certain dangers, do not alter this appearance when they are in an environment quite devoid of danger.... If they live in places where their coats or their hides do not conceal them, they do not adapt themselves to their surroundings in any way.

The _selection of the most beautiful_ has been so exaggerated, that it greatly exceeds the instincts for beauty in our own race! As a matter of fact, the most beautiful creature often couples with the most debased, and the largest with the smallest. We almost always see males and females taking advantage of their first chance meeting, and manifesting no taste or selectiveness at all.--Modification through climate and nourishment--but as a matter of fact unimportant.

There are no _intermediate forms.--_

The growing evolution of creatures is assumed. All grounds for this assumption are entirely lacking. Every type has its _limitations_: beyond these evolution cannot carry it.

My general point of view. First proposition: Man as a species is _not_ progressing. Higher specimens are indeed attained; but they do not survive. The general level of the species is not raised.

Second proposition: Man as a species does not represent any sort of progress compared with any other animal. The whole of the animal and plant world does not develop from the lower to the higher.... but all simultaneously, haphazardly, confusedly, and at variance. The richest and most complex forms--and the term "higher type" means no more than this--perish more easily: only the lowest succeed in maintaining their apparent imperishableness. The former are seldom attained, and maintain their superior position with difficulty, the latter are compensated by great fruitfulness.--In the human race, also, the _superior specimens,_ the happy cases of evolution, are the first to perish amid the fluctuations of chances for and against them. They are exposed to every form of decadence: they are extreme, and, on that account alone, already decadents.... The short duration of beauty, of genius, of the Cæsar, is _sui generis:_ such things are not hereditary. The _type_ is inherited, there is nothing extreme or particularly "happy" about a type----It is not a case of a particular fate, or of the "evil will" of Nature, but merely of the concept "superior type": the higher type is an example of an incomparably greater degree of complexity a greater sum of co-ordinated elements: but on this account disintegration becomes a thousand times more threatening. "Genius" is the sublimest machine in existence--hence it is the most fragile.

Third propositio:: The domestication (culture) of man does not sink very deep. When it does sink far below the skin it immediately becomes degeneration (type: the Christian). The wild man (or, in moral terminology, the _evil_ man) is a reversion to Nature--and, in a certain sense, he represents a recovery, a _cure_ from the effects of "culture." ...

685.

Anti-Darwin.--What surprises me most on making a general survey of the great destinies of man, is that I invariably see the reverse of what to-day Darwin and his school sees or _will_ persist in seeing: selection in favour of the stronger, the better-constituted, and the progress of the species. Precisely the reverse of this stares one in the face: the suppression of the lucky cases, the uselessness of the more highly constituted types, the inevitable mastery of the mediocre, and even of those who are _below mediocrity._ Unless we are shown some reason why man is an exception among living creatures, I incline to the belief that Darwin's school is everywhere at fault. That will to power, in which I perceive the ultimate reason and character of all change, explains why it is that selection is never in favour of the exceptions and of the lucky cases: the strongest and happiest natures are weak when they are confronted with a majority ruled by organised gregarious instincts and the fear which possesses the weak. My general view of the world of values shows that in the highest values which now sway the destiny of man, the happy cases among men, the select specimens do not prevail: but rather the decadent specimens,--perhaps there is nothing more interesting in the world than this _unpleasant_ spectacle....

Strange as it may seem, the strong always have to be upheld against the weak; and the well-constituted against the ill-constituted, the healthy against the sick and physiologically botched. If we drew our morals from reality, they would read thus: the mediocre are more valuable than the exceptional creatures, and the decadent than the mediocre; the will to nonentity prevails over the will to life--and the general aim now is, in Christian, Buddhistic, Schopenhauerian phraseology: "It is better not to be than to be."

I _protest_ against this formulating of reality into a moral: and I loathe Christianity with a deadly loathing, because it created sublime words and attitudes in order to deck a revolting truth with all the tawdriness of justice, virtue, and godliness....

I see all philosophers and the whole of science on their knees before a reality which is the reverse of "the struggle for life," as Darwin and his school understood it--that is to say, wherever I look, I see those prevailing and surviving, who throw doubt and suspicion upon life and the value of life.--The error of the Darwinian school became a problem to me: how can one be so blind as to make _this_ mistake?

That _species_ show an ascending tendency, is the most nonsensical assertion that has ever been made: until now they have only manifested a dead level. There is nothing whatever to prove that the higher organisms have developed from the lower. I see that the lower, owing to their numerical strength, their craft, and ruse, now preponderate,--and I fail to see an instance in which an accidental change produces an advantage, at least not for a very long period: for it would be necessary to find some reason why an accidental change should become so very strong.

I do indeed find the "cruelty of Nature" which is so often referred to; but in a different place: Nature is cruel, but against her lucky and well-constituted children; she protects and shelters and loves the lowly.

In short, the increase of a species' power, as the result of the preponderance of its particularly well-constituted and strong specimens, is perhaps less of a certainty than that it is the result of the preponderance of its mediocre and lower specimens ... in the case of the latter, we find great fruitfulness and permanence: in the case of the former, the besetting dangers are greater, waste is more rapid, and decimation is more speedy.

686.

Man as he has appeared up to the present is the embryo of the man of the future; _all_ the formative powers which are to produce the latter, already lie in the former: and owing to the fact that they are enormous, the more _promising for the future_ the modern individual happens to be, the more _suffering_ falls to his lot. This is the profoundest concept of _suffering._ The formative powers clash.--The isolation of the individual need not deceive one--as a matter of fact, some uninterrupted current does actually flow through all individuals, and does thus unite them. The fact that they feel themselves isolated, is the _most powerful spur_ in the process of setting themselves the loftiest of aims: their search for happiness is the means which keeps together and moderates the formative powers, and keeps them from being mutually destructive.

687.

Excessive intellectual strength sets _itself_ new goals; it is not in the least satisfied by the command and the leadership of the inferior world, or by the preservation of the organism, of the "individual."

We are _more_ than the individual: we are the whole chain itself, with the tasks of all the possible futures of that chain in us.

3. Theory of the Will to Power and of Valuations.

688.

The unitary view of psychology.--We are accustomed to regard the development of a vast number of forms as compatible with one single origin.

My theory would be: that the will to power is the primitive motive force out of which all other motives have been derived;

That it is exceedingly illuminating to substitute _power_ for individual "happiness" (after which every living organism is said to strive): "It strives after power, after _more_ power";--happiness is only a symptom of the feeling of power attained, a consciousness of difference (it does not strive after happiness: but happiness steps in when the object is attained, after which the organism has striven: happiness is an accompanying, not an actuating factor);

That all motive force is the will to power; that there is no other force, either physical, dynamic, or psychic.

In our science, where the concept cause and effect is reduced to a relationship of complete equilibrium, and in which it seems desirable for the _same_ quantum of force to be found on either side, _all idea of a motive power is absent_: we only apprehend results, and we call these equal from the point of view of their content of force....

It is a matter of mere experience that change never ceases: at bottom we have not the smallest grounds for assuming that any one particular change must follow upon any other. On the contrary, any state which has been attained would seem almost forced to maintain itself intact if it had not within itself a capacity for not desiring to maintain itself.... Spinoza's proposition concerning "self-preservation" ought as a matter of fact to put a stop to change. But the proposition is false; the contrary is true. In all living organisms it can be clearly shown that they do everything not to remain as they are, but to become greater....

689.

"Will to power" and causality.--From a psychological point of view the idea of "cause" is our feeling of power in the act which is called willing--our concept effect is the superstition that this feeling of power is itself the force which moves things....

A state which accompanies an event and is already an effect of that event is deemed "sufficient cause" of the latter; the tense relationship of our feeling of power (pleasure as the feeling of power) and of an obstacle being overcome--are these things

illusions?

If we translate the notion "cause" back into the only sphere which is known to us, and out of which we have taken it, we cannot imagine _any change_ in which the will to power is not inherent. We do not know how to account for any change which is not a _trespassing_ of one power on another.

Mechanics only show us the results, and then only in images (movement is a figure of speech); gravitation itself has no mechanical cause, because it is itself the first cause of mechanical results.

The will to _accumulate force_ is confined to the phenomenon of life, to nourishment, to procreation, to inheritance, to society, states, customs, authority. Should we not be allowed to assume that this will is the motive power also of chemistry?--and of the cosmic order?

Not only conservation of energy, but the minimum amount of waste; so that the only reality is this: _the will of every centre of power to become stronger_--not self-preservation, but the desire to appropriate, to become master, to become more, to become stronger.

Is the fact that science is possible a proof of the principle of causation--"From like causes, like effects"--"A permanent law of things"--"Invariable order"? Because something is calculable, is it therefore on that account necessary?

If something happens thus, and thus only, it is not the manifestation of a "principle," of a "law," of "order." What happens is that certain quanta of power begin to operate, and their essence is to exercise their power over all other quanta of power. Can we assume the existence of a striving after power without a feeling of pleasure and pain, _i.e._ without the sensation of an increase or a decrease of power? Is mechanism only a language of signs for the concealed fact of a world of fighting and conquering quanta of will-power? All mechanical first-principles, matter, atoms, weight, pressure, and repulsion, are not facts in themselves, but interpretations arrived at with the help of psychical fictions.

Life, which is our best known form of being, is altogether "will to the accumulation of strength"--all the processes of life hinge on this: everything aims, not at preservation, but at accretion and accumulation. Life as an individual case (a hypothesis which may be applied to existence in general) strives after the maximum feeling of power; life is essentially a striving after more power; striving itself is only a straining after more power; the most fundamental and innermost thing of all is this will. (Mechanism is merely the semeiotics of the results.)

690.

The thing which is the cause of the existence of development cannot in the course of investigation be found above development; it should neither be regarded as "evolving" nor as evolved ... the "will to power" cannot have been evolved.

691.

What is the relation of the whole of the organic process towards the rest of nature?--Here the fundamental will reveals itself.

692.

Is the "will to power" a kind of will, or is it identical with the concept will? Is it equivalent to desiring or commanding; is it the will which Schopenhauer says is the essence of things?

My proposition is that the will of psychologists hitherto has been an unjustifiable generalisation, and that there is no such thing as this sort of will, that instead of the development of one will into several forms being taken as a fact, the character of will has been cancelled owing to the fact that its content, its "whither," was subtracted from it: in Schopenhauer this is so in the highest degree; what he calls "will" is merely an empty word. There is even less plausibility in the will to live: for life is simply one of the manifestations of the will to power; it is quite arbitrary and ridiculous to suggest that everything is striving to enter into this particular form of the will to power.

693.

If the innermost essence of existence is the will to power; if happiness is every increase of power, and unhappiness the feeling of not being able to resist, of not being able to become master: may we not then postulate happiness and pain as cardinal facts? Is will possible without these two oscillations of yea and nay? But who feels happiness? ... Who will have power? ... Nonsensical

question! If the essence of all things is itself will to power, and consequently the ability to feel pleasure and pain! Albeit: contrasts and obstacles are necessary, therefore also, relatively, units which trespass on one another.

694.

According to the obstacles which a force seeks with a view of overcoming them, the measure of the failure and the fatality thus provoked must increase, and in so far as every force can only manifest itself against some thing that opposes it, an element of unhappiness is necessarily inherent in every action. But this pain acts as a greater incitement to life, and increases the will to power.

695.

If pleasure and pain are related to the feeling of power, life would have to represent such an increase in power that the difference, the "plus," would have to enter consciousness. A dead level of power, if maintained, would have to measure its happiness in relation to depreciations of that level, _i.e._ in relation to states of unhappiness and not of happiness.... The will to an increase lies in the essence of happiness: that power is enhanced, and that this difference becomes conscious.

In a state of decadence after a certain time the opposite difference becomes conscious, that is decrease: the memory of former strong moments depresses the present feelings of happiness in this state comparison reduces happiness.

696.

It is not the satisfaction of the will which is the cause of happiness (to this superficial theory I am more particularly opposed--this absurd psychological forgery in regard to the most simple things), but it is that the will is always striving to overcome that which stands in its way. The feeling of happiness lies precisely in the discontentedness of the will, in the fact that without opponents and obstacles it is never satisfied. "The happy man": a gregarious ideal.

697.

The normal discontent of our instincts--for instance, of the instinct of hunger, of sex, of movement--contains nothing which is in itself depressing; it rather provokes the feeling of life, and, whatever the pessimists may say to us, like all the rhythms of small and irritating stimuli, it strengthens. Instead of this discontent making us sick of life, it is rather the great stimulus to life.

(Pleasure might even perhaps be characterised as the rhythm of small and painful stimuli.)

698.

Kant says: "These lines of Count Verri's (_Sull' indole del piacere e del dolore;_ 1781) I confirm with absolute certainty: 'Il solo principio motore dell' uomo è il dolore. Il dolore precede ogni piacere. Il piacere non è un essere positivo.'"[5]

[Footnote 5: _On the Nature of Pleasure and Pain._ "The only motive force of man is pain. Pain precedes every pleasure. Pleasure is not a positive thing."--Tr.]

699.

Pain is something different from pleasure--I mean it is not the latter's opposite.

If the essence of pleasure has been aptly characterised as the feeling of increased power (that is to say, as a feeling of difference which presupposes comparison), that does not define the nature of pain. The false contrasts which the people, and consequently the language, believes in, are always dangerous fetters which impede the march of truth. There are even cases where a kind of pleasure is conditioned by a certain rhythmic sequence of small, painful stimuli: in this way a very rapid growth of the feeling of power and of the feeling of pleasure is attained. This is the case, for instance, in tickling, also in the sexual tickling which accompanies the coitus: here we see pain acting as the ingredient of happiness. It seems to be a small hindrance which is overcome, followed immediately by another small hindrance which once again is overcome--this play of resistance and resistance overcome is the greatest excitant of that complete feeling of overflowing and surplus power which constitutes the essence of happiness.

The converse, which would be an increase in the feeling of pain through small intercalated pleasurable stimuli, does not exist: pleasure and pain are not opposites.

Pain is undoubtedly an intellectual process in which a judgment is inherent--the judgment harmful, in which long experience is epitomised. There is no such thing as pain in itself. It is not the wound that hurts, it is the experience of the harmful results a wound may have for the whole organism, which here speaks in this deeply moving way, and is called pain. (In the case of deleterious influences which were unknown to ancient man, as, for instance, those residing in the new combination of poisonous chemicals, the hint from pain is lacking, and we are lost.)

That which is quite peculiar in pain is the prolonged disturbance, the quivering subsequent to a terrible shock in the ganglia of the nervous system. As a matter of fact, nobody suffers from the cause of pain (from any sort of injury, for instance), but from the protracted disturbance of his equilibrium which follows upon the shock. Pain is a disease of the cerebral centres--pleasure is no disease at all.

The fact that pain may be the cause of reflex actions has appearances and even philosophical prejudice in its favour. But in very sudden accidents, if we observe closely, we find that the reflex action occurs appreciably earlier than the feeling of pain. I should be in a bad way when I stumbled if I had to wait until the fact had struck the bell of my consciousness, and until a hint of what I had to do had been telegraphed back to me. On the contrary, what I notice as clearly as possible is, that first, in order to avoid a fall, reflex action on the part of my foot takes place, and then, after a certain measurable space of time, there follows quite suddenly a kind of painful wave in my forehead. Nobody, then, reacts to pain. Pain is subsequently projected into the wounded quarter--but the essence of this local pain is nevertheless not the expression of a kind of local wound, it is merely a local sign, the strength and nature of which is in keeping with the severity of the wound, and of which the nerve centres have taken note. The fact that as the result of this shock the muscular power of the organism is materially reduced, does not prove in any way that the essence of pain is to be sought in the lowering of the feeling of power.

Once more let me repeat: nobody reacts to pain: pain is no "cause" of action. Pain itself is a reaction; the reflex movement is another and earlier process--both originate at different points....

700.

The message of pain: in itself pain does not announce that which has been momentarily damaged, but the significance of this damage for the individual as a whole.

Are we to suppose that there are any pains which "the species" feel, and which the individual does not?

701.

"The sum of unhappiness outweighs the sum of happiness: consequently it were better that the world did not exist"--"The world is something which from a rational standpoint it were better did not exist, because it occasions more pain than pleasure to the feeling subject"--this futile gossip now calls itself pessimism!

Pleasure and pain are accompanying factors, not causes; they are second-rate valuations derived from a dominating value,--they are one with the feeling "useful," "harmful," and therefore they are absolutely fugitive and relative. For in regard to all utility and harmfulness there are a hundred different ways of asking "what for?"

I despise this pessimism of sensitiveness: it is in itself a sign of profoundly impoverished life.

702.

Man does not seek happiness and does not avoid unhappiness. Everybody knows the famous prejudices I here contradict. Pleasure and pain are mere results, mere accompanying phenomena--that which every man, which every tiny particle of a living organism will have, is an increase of power. In striving after this, pleasure and pain are encountered; it is owing to that will that the organism seeks opposition and requires that which stands in its way.... Pain as the hindrance of its will to power is therefore a normal feature, a natural ingredient of every organic phenomenon; man does not avoid it, on the contrary, he is constantly in need of it: every triumph, every feeling of pleasure, every event presupposes an obstacle overcome.

Let us take the simplest case, that of primitive nourishment; the protoplasm extends its pseudopodia in order to seek for that which resists it,--it does not do so out of hunger, but owing to its will to power. Then it makes the attempt to overcome, to appropriate, and to incorporate that with which it comes into contact--what people call "nourishment" is merely a derivative, a utilitarian application, of the primordial will to become stronger.

Pain is so far from acting as a diminution of our feeling of power, that it actually forms in the majority of cases a spur to this feeling,--the obstacle is the stimulus of the will to power.

703.

Pain has been confounded with one of its subdivisions, which is exhaustion: the latter does indeed represent a profound reduction and lowering of the will to power, a material loss of strength--that is to say, there is _(a)_ pain as the stimulus to an increase or power, and _(b)_ pain following upon an expenditure of power; in the first case it is a spur, in the second it is the outcome of excessive spurring.... The inability to resist is proper to the latter form of pain: the provocation of that which resists is proper to the former.... The only happiness which is to be felt in the state of exhaustion is that of going to sleep; in the other case, happiness means triumph.... The great confusion of psychologists consisted in the fact that they did not keep these two kinds of happiness--that of falling asleep, and that of triumph--sufficiently apart. Exhausted people will have repose, slackened limbs, peace and quiet--and these things constitute the bliss of Nihilistic religions and philosophies, the wealthy in vital strength, the active, want triumph, defeated opponents, and the extension of their feeling of power over ever wider regions. Every healthy function of the organism has this need,--and the whole organism constitutes an intricate complexity of systems struggling for the increase of the feeling of power....

704.

How is it that the fundamental article of faith in all psychologies is a piece of most outrageous contortion and fabrication? "Man strives after happiness," for instance--how much of this is true? In order to understand what life is, and what kind of striving and tenseness life contains, the formula should hold good not only of trees and plants, but of animals also. "What does the plant strive after?"--But here we have already invented a false entity which does not exist,--concealing and denying the fact of an infinitely variegated growth, with individual and semi-individual starting-points, if we give it the clumsy title "plant" as if it were a unit. It is very obvious that the ultimate and smallest "individuals" cannot be understood in the sense of metaphysical individuals or atoms; their sphere of power is continually shifting its ground: but with all these changes, can it be said that any of them strives after happiness?--All this expanding, this incorporation and growth, is a search for resistance; movement is essentially related to states of pain: the driving power here must represent some other desire if it leads to such continual willing and seeking of pain.--To what end do the trees of a virgin forest contend with each other? "For happiness"?--For power! ...

Man is now master of the forces of nature, and master too of his own wild and unbridled feelings (the passions have followed suit, and have learned to become useful)--in comparison with primeval man, the man of to-day represents an enormous quantum of power, but not an increase in happiness! How can one maintain, then, that he has striven after happiness?..

705.

But while I say this I see above me, and below the stars, the glittering rat's-tail of errors which hitherto has represented the greatest inspiration of man: "All happiness is the result of virtue all virtue is the result of free will"!

Let us transvalue the values: all capacity is the outcome of a happy organisation, all freedom is the outcome of capacity (freedom understood here as facility in self-direction. Every artist will understand me).

706.

"The value of life."--Every life stands by itself; all existence must be justified, and not only life,--the justifying principle must be one through which life itself speaks.

Life is only a means to something: it is the expression of the forms of growth in power.

707.

The "conscious world" cannot be a starting-point for valuing: an "objective" valuation is necessary.

In comparison with the enormous and complicated antagonistic processes which the collective life of every organism represents, its conscious world of feelings, intentions, and valuations, is only a small slice. We have absolutely no right to postulate this particle of consciousness as the object, the wherefore, of the collective phenomena of life: the attainment of consciousness is obviously only an additional means to the unfolding of life and to the extension of its power. That is why it is a piece of childish simplicity to set up happiness, or intellectuality, or morality, or any other individual sphere of consciousness, as the highest value: and maybe to justify "the world" with it.

This is my fundamental objection to all philosophical and moral cosmologies and theologies, to all wherefores and highest values that have appeared in philosophies and philosophic religions hitherto. A kind of means is misunderstood as the object itself: conversely life and its growth of power were debased to a means.

If we wished to postulate an adequate object of life it would not necessarily be related in any way with the category of conscious life; it would require rather to explain conscious life as a mere means to itself....

The "denial of life" regarded as the object of life, the object of evolution! Existence--a piece of tremendous stupidity! Any such mad interpretation is only the outcome of life's being measured by the factors of consciousness (pleasure and pain, good and evil). Here the means are made to stand against the end--the "unholy," absurd, and, above all, disagreeable means: how can the end be any use when it requires such means? But where the fault lies is here--instead of looking for the end which would explain the necessity of such means, we posited an end from the start which actually excludes such means, _i.e._ we made a desideratum in regard to certain means (especially pleasurable, rational, and virtuous) into a rule, and then only did we decide what end would be desirable....

Where the fundamental fault lies is in the fact that, instead of regarding consciousness as an instrument and an isolated phenomenon of life in general, we made it a standard, the highest value in life: it is the faulty standpoint of _a parte ad totum,_--and that is why all philosophers are instinctively seeking at the present day for a collective consciousness, a thing that lives and wills consciously with all that happens, a "Spirit," a "God." But they must be told that it is precisely thus that life is converted into a monster; that a "God" and a general sensorium would necessarily be something on whose account the whole of existence would have to be condemned.... Our greatest relief came when we eliminated the general consciousness which postulates ends and means--in this way we ceased from being necessarily pessimists.... Our greatest indictment of life was the existence of God.

708.

Concerning the value of "Becoming."--If the movement of the world really tended to reach a final state, that state would already have been reached. The only fundamental fact, however, is that it does not tend to reach a final state: and every philosophy and scientific hypothesis (_e.g._ materialism) according to which such a final state is necessary, is refuted by this fundamental fact.

I should like to have a concept of the world which does justice to this fact. Becoming ought to be explained without having recourse to such final designs. Booming must appear justified at every instant (or it must defy all valuation: which has unity as its end); the present must not under any circumstances be justified by a future, nor must the past be justified for the sake of the present. "Necessity" must not be interpreted in the form of a prevailing and ruling collective force or as a prime motor; and still less as the necessary cause of some valuable result. But to this end it is necessary to deny a collective consciousness for Becoming,--a "God," in order that life may not be veiled under the shadow of a being who feels and knows as we do and yet _wills_ nothing: "God" is useless if he wants nothing; and if he do want something, this presupposes a general sum of suffering and irrationality which lowers the general value of Becoming. Fortunately any such general power is lacking (a suffering God overlooking everything, a general sensorium and ubiquitous Spirit, would be the greatest indictment of existence).

Strictly speaking nothing of the nature of Being must be allowed to remain,--because in that case Becoming loses its value and gets to be sheer and superfluous nonsense.

The next question, then, is: how did the illusion Being originate (why was it obliged to originate);

Likewise: how was it that all valuations based upon the hypothesis that there was such a thing as Being came to be depreciated.

But in this way we have recognised that this hypothesis concerning Being is the source of all the calumny that has been directed against the world (the "Better world," the "True world" the "World Beyond," the "Thing-in-itself").

(1) Becoming has no final state, it does not tend towards stability.

(2) Becoming is not a state of appearance, the world of Being is probably only appearance.

(3) Becoming is of precisely the same value at every instant; the sum of its value always remains equal: expressed otherwise, it has no value; for that according to which it might be measured, and in regard to which the word value might have some sense, is entirely lacking. The collective value of the world defies valuation; for this reason philosophical pessimism belongs to the order of farces.

709.

We should not make our little desiderata the judges of existence! Neither should we make culminating evolutionary forms (_e.g._ mind) the "absolute" which stands behind evolution!

710.

Our knowledge has become scientific to the extent in which it has been able to make use of number and measure. It might be worth while to try and see whether a scientific order of values might not be constructed according to a scale of numbers and measures representing energy.... All other values are matters of prejudice, simplicity, and misunderstanding. They may all be reduced to that scale of numbers and measures representing energy. The ascent in this scale would represent an increase of value, the descent a diminution.

But here appearance and prejudice are against one (moral values are only apparent values compared with those which are physiological).

711.

Why the standpoint of "value" lapses:--

Because in the _"whole process of the universe" the work of mankind does not come under consideration_; because a general process (viewed in the light of a system) does not exist.

Because there is no such thing as a whole; because no _depreciation of human_ existence or human aims can be made in regard to something that does not exist.

Because "necessity," "causality," "design," are merely useful "_semblances._"

Because the aim is _not_ "the increase of the sphere of consciousness," _but the increase of power_; in which increase the utility of consciousness is also contained; and the same holds good of pleasure and pain.

Because a mere _means_ must not be elevated to the highest criterion of value (such as states of consciousness like pleasure and pain, if consciousness is in itself only a means).

Because the world is not an organism at all, but a thing of chaos; because the development of "intellectuality" is only a means tending relatively to extend the duration of an organisation.

Because all "desirability" has no sense in regard to the general character of existence.

712.

"God" is the culminating moment: life is an eternal process of deifying and undeifying. _But withal there is no zenith of values,_ but only a zenith of _power._

Absolute _exclusion of mechanical and materialistic interpretations._ they are both only expressions of inferior states, of emotions deprived of all spirit (of the "will to power").

The retrograde movement front the zenith of development (the intellectualisation of power on some slave-infected soil) may be shown to be the _result_ of the highest degree of energy _turning against_ itself, once it no longer has anything to organise, and utilising its power in order to _disorganise._

_(a)_ The ever-increasing _suppression_ of societies, and the latter's subjection by a smaller number of stronger individuals.

(b) The ever-increasing suppression of the privileged and the strong, hence the rise of democracy, and ultimately of _anarchy,_ in the elements.

713.

Value is the highest amount of power that a man can assimilate--a man, not mankind! Mankind is much more of a means than an end. It is a question of type: mankind is merely the experimental material; it is the overflow of the ill-constituted--a field of ruins.

714.

Words relating to values are merely banners planted on those spots where a _new blessedness_ was discovered--a new _feeling._

715.

The standpoint of "value" is the same as that of the _conditions_ of _preservation_ and _enhancement,_ in regard to complex creatures of relative stability appearing in the course of evolution.

There are no such things as lasting and ultimate entities, no atoms, no monads: here also "permanence" was first introduced by ourselves (from practical, utilitarian, and other motives).

"The forms that rule"; the sphere of the subjugated is continually extended; or it decreases or increases according to the conditions (nourishment) being either favourable or unfavourable.

"Value" is essentially the standpoint for the increase or decrease of these dominating centres (pluralities in any case; for "unity" cannot be observed anywhere in the nature of development).

The means of expression afforded by language are useless for the purpose of conveying any facts concerning "development": the need of positing a rougher world of stable existences and things forms part of our _eternal desire for preservation._ We may speak of atoms and monads in a relative sense: and this is certain, _that the smallest world is the most stable world ..._. There is no such thing as will: there are only punctuations of will, which are constantly increasing and decreasing their power.

III

THE WILL TO POWER AS EXEMPLIFIED IN SOCIETY AND THE INDIVIDUAL.

1. Society and the State.

716.

We take it as a principle that only individuals feel any responsibility. Corporations are invented to do what the individual has not the courage to do. For this reason all communities are vastly more upright and instructive, as regards the nature of man, than the individual who is too cowardly to have the courage of his own desires.

All altruism is the prudence of the private man. societies are not mutually altruistic. The commandment, "Thou shalt love thy next-door neighbour," has never been extended to thy neighbour in general. Rather what Manu says is probably truer: "We must conceive of all the States on our own frontier, and their allies, as being hostile, and for the same reason we must consider all of their neighbours as being friendly to us."

The study of society is invaluable, because man in society is far more childlike than man individually. Society has never regarded virtue as anything else than as a means to strength, power, and order. Manu's words again are simple and dignified: "Virtue could hardly rely on her own strength alone. Really it is only the fear of punishment that keeps men in their limits, and leaves every one in peaceful possession of his own."

717.

The State, or _unmorality_ organised, is from within--the police, the penal code, status, commerce, and the family; and from without, the will to war, to power, to conquest and revenge.

A multitude will do things an individual will not, because of the division of responsibility, of command and execution; because the virtues of obedience, duty, patriotism, and local sentiment are all introduced; because feelings of pride, severity, strength, hate, and revenge in short, all typical traits are upheld, and these are characteristics utterly alien to the herd-man.

718.

You haven't, any of you, the courage either to kill or to flog a man. But the huge machinery of the State quells the individual and makes him decline to be answerable for his own deed (obedience, loyalty, etc.).

Everything that a man does in the service of the State is against his own nature. Similarly, everything he learns in view of future service of the State. This result is obtained through division of labour (so that responsibility is subdivided too):--

The legislator--and he who fulfils the law.

The teacher of discipline--and those who have grown hard and severe under discipline.

719.

A division of labour among the emotions exists inside society, making individuals and classes produce an imperfect, but more useful, kind of soul. Observe how every type in society has become atrophied with regard to certain emotions with the view of fostering and accentuating other emotions.

Morality may be thus justified:--

Economically,--as aiming at the greatest possible use of all individual power, with the view of preventing the waste of exceptional natures.

Æsthetically,--as the formation of fixed types, and the pleasure in one's own.

Politically,--as the art of bearing with the severe divergencies of the degrees of power in society.

Psychologically, as an imaginary preference for the bungled and the mediocre, in order to preserve the weak.

720.

Man has one terrible and fundamental wish; he desires power, and this impulse, which is called freedom, must be the longest restrained. Hence ethics has instinctively aimed at such an education as shall restrain the desire for power; thus our morality slanders the would-be tyrant, and glorifies charity, patriotism, and the ambition of the herd.

721.

Impotence to power, how it disguises itself and plays the hypocrite, as obedience, subordination, the pride of duty and morality, submission, devotion, love (the idolisation and apotheosis of the commander is a kind of compensation, and indirect self-enhancement). It veils itself further under fatalism and resignation, objectivity, self-tyranny, stoicism, asceticism, self-abnegation, hallowing. Other disguises are: criticism, pessimism, indignation, susceptibility, beautiful soul, virtue, self--deification, philosophic detachment, freedom from contact with the world (the realisation of impotence disguises itself as disdain).

There is a universal need to exercise some kind of power, or to create for one's self the appearance of some power, if only temporarily, in the form of intoxication.

There are men who desire power simply for the sake of the happiness it will bring; these belong chiefly to political parties. Other men have the same yearning, even when power means visible disadvantages, the sacrifice of their happiness, and well-being; they are the ambitious. Other men, again, are only like dogs in a manger, and will have power only to prevent its falling into the hands of others on whom they would then be dependent.

722.

If there be justice and equality before the law, what would thereby be abolished?--Suspense, enmity, hatred. But it is a mistake to think that you thereby increase happiness; for the Corsicans rejoice in more happiness than the Continentals.

723.

Reciprocity and the expectation of a reward is one of the most seductive forms of the devaluation of mankind. It involves that equality which depreciates any gulf as immoral.

724.

Utility is entirely dependent upon the object to be attained,--the wherefore? And this wherefore, this purpose, is again dependent upon the degree of power. Utilitarianism is not, therefore, a fundamental doctrine; it is only a story of sequels, and cannot be made obligatory for all.

725.

Of old, the State was regarded theoretically as a utilitarian institution; it has now become so in a practical sense. The time of kings has gone by, because people are no longer worthy of them. They do not wish to see the symbol of their ideal in a king, but only a means to their own ends. That's the whole truth.

726.

I am trying to grasp the absolute sense of the communal standard of judgment and valuation, naturally without any intention of deducing morals.

The degree of psychological falsity and denseness required in order to sanctify the emotions essential to preservation and expansion of power, and to create a good conscience for them.

The degree of stupidity required in order that general rules and values may remain possible (including education, formation of culture, and training).

The degree of inquisitiveness, suspicion, and intolerance required in order to deal with exceptions, to suppress them as criminals, and thus to give them bad consciences, and to make them sick with their own singularity.

727.

Morality is essentially a shield, a means of defence; and, in so far, it is a sign of the imperfectly developed man (he is still in armour; he is still stoical).

The fully developed man is above all provided with _weapons:_ he is a man who _attacks._

The weapons of war are converted into weapons of peace (out of scales and carapaces grow feathers and hair).

728.

The very notion, "living organism", implies that there must be growth,--that there must be a striving after an extension of power, and therefore a process of absorption of other forces. Under the drowsiness brought on by moral narcotics, people speak of the right of the individual to _defend himself;_ on the same principle one might speak of his right to _attack_: for _both_--and the latter more than the former--are necessities where all living organisms are concerned: aggressive and defensive egoism are not questions of choice or even of "free will," but they are fatalities of life itself.

In this respect it is immaterial whether one have an individual, a living body, or "an advancing society" in view. The right to punish (or society's means of defence) has been arrived at only through a misuse of the word "right": a right is acquired only by contract, but self-defence and self-preservation do not stand upon the basis of a contract. A people ought at least, with quite as much justification, to be able to regard its lust of power, either in arms, commerce, trade, or colonisation, as a right the right of growth, perhaps.... When the instincts of a society ultimately make it give up war and renounce conquest, it is decadent: it is ripe for democracy and the rule of shopkeepers. In the majority of cases, it is true, assurances of peace are merely stupefying draughts.

729.

The maintenance of the military State is the last means of adhering to the great tradition of the past; or, where it has been lost, to revive it. By means of it the superior or strong type of man is preserved, and all institutions and ideas which perpetuate enmity and order of rank in States, such as national feeling, protective tariffs, etc., may on that account seem justified.

730.

In order that a thing may last longer than a person (that is to say, in order that a work may outlive the individual who has created it), all manner of limitations and prejudices must be imposed upon people. But how? By means of love, reverence, gratitude towards the person who created the work, or by means of the thought that our ancestors fought for it, or by virtue of the feeling that the safety of our descendants will be secured if we uphold the work--for instance, the _polis._ Morality is essentially the means of; making something survive the individual, because it makes him of necessity a slave. Obviously the aspect from above is different from the aspect from below, and will lead to quite different interpretations. How is organised power _maintained_?--By the fact that countless generations sacrifice themselves to its cause.

731.

Marriage, property, speech, tradition, race, family, people, and State, are each links in a chain--separate parts which have a more or less high or low origin. Economically they are justified by the surplus derived from the advantages of uninterrupted work and multiple production, as weighed against the disadvantages of greater expense in barter and the difficulty of making things last. (The working parts are multiplied, and yet remain largely idle. Hence the cost of producing them is greater, and the cost of maintaining them by no means inconsiderable.) The advantage consists in avoiding interruption and incident loss. Nothing is more expensive than a start. "The higher the standard of living, the greater will be the expense of maintenance, nourishment, and propagation, as also the risk and the probability of an utter fall on reaching the summit."

732.

In bourgeois marriages, naturally in the best sense of the word marriage, there is no question whatsoever of love any more than there is of money. For on love no institution can be founded. The whole matter consists in society giving leave to two persons to satisfy their sexual desires under conditions obviously designed to safeguard social order. Of course there must be a certain attraction between the parties and a vast amount of good nature, patience, compatibility, and charity in any such contract. But the word love should not be misused as regards such a union. For two lovers, in the real and strong meaning of the word, the satisfaction of sexual desire is unessential; it is a mere symbol. For the one side, as I have already said, it is a symbol of unqualified submission: for the other, a sign of condescension--a sign of the appropriation of property. Marriage, as understood by the real old nobility, meant the breeding forth of the race (but are there any nobles nowadays? _Quaeritur_),--that is to say, the maintenance of a fixed definite type of ruler, for which object husband and wife were sacrificed. Naturally the first consideration here had nothing to do with love; on the contrary! It did not even presuppose that mutual sympathy which is the _sine qua non_ of the bourgeois marriage. The prime consideration was the interest of the race, and in the second place came the interest of a particular class. But in the face of the coldness and rigour and calculating lucidity of such a noble concept of marriage as prevailed among every healthy aristocracy, like that of ancient Athens, and even of Europe during the eighteenth century, we warm-blooded animals, with our miserably oversensitive hearts, we "moderns," cannot restrain a slight shudder. That is why love as a passion, in the big meaning of this word, was invented for, and in, an aristocratic community--where convention and abstinence are most severe.

733.

Concerning the future of marriage. A super-tax on inherited property, a longer term of military service for bachelors of a certain minimum age within the community.

Privileges of all sorts for fathers who lavish boys upon the world, and perhaps plural votes as well.

A medical certificate as a condition of any marriage, endorsed by the parochial authorities, in which a series of questions addressed to the parties and the medical officers must be answered ("family histories").

As a counter-agent to prostitution, or as its ennoblement, I would recommend leasehold marriages (to last for a term of years or months), with adequate provision for the children.

Every marriage to be warranted and sanctioned by a certain number of good men and true, of the parish, as a parochial obligation.

734.

Another commandment of philanthropy.--There are cases where to have a child would be a crime--for example, for chronic invalids and extreme neurasthenics. These people should be converted to chastity, and for this purpose the music of _Parsifal_ might at all events be tried. For Parsifal himself, that born fool, had ample reasons for not desiring to propagate. Unfortunately, however, one of the regular symptoms of exhausted stock is the inability to exercise any self-restraint in the presence of stimuli, and the tendency to respond to the smallest sexual attraction. It would be quite a mistake, for instance, to think of Leopardi as a chaste man. In such cases the priest and moralist play a hopeless game: it would be far better to send for the apothecary. Lastly, society here has a positive duty to fulfil, and of all the demands that are made on it, there are few more urgent and necessary than this one. Society as the trustee of life, is responsible to life for every botched life that comes into existence, and as it has to atone for such lives, it ought consequently to make it impossible for them ever to see the light of day: it should in many cases actually prevent the act of procreation, and may, without any regard for rank, descent, or intellect, hold in readiness the most rigorous forms of compulsion and restriction, and, under certain circumstances, have recourse to castration. The Mosaic law, "Thou shalt do no murder," is a piece of ingenuous puerility compared with the earnestness of this forbidding of life to decadents, "Thou shalt not beget"!!! ... For life itself recognises no solidarity or equality of rights between the healthy and unhealthy parts of an organism. The latter must at all cost be _eliminated,_ lest the whole fall to pieces. Compassion for decadents, equal rights for the physiologically botched--this would be the very pinnacle of immorality, it would be setting up Nature's most formidable opponent as morality itself!

735.

There are some delicate and morbid natures, the so-called idealists, who can never under any circumstances rise above a coarse, immature crime: yet it is the great justification of their anæmic little existence, it is the small requital for their lives of cowardice and falsehood to have been for one _instant_ at least--strong. But they generally collapse after such an act.

736.

In our civilised world we seldom hear of any but the bloodless, trembling criminal, overwhelmed by the curse and contempt of society, doubting even himself, and always belittling and belying his deeds--a misbegotten sort of criminal; that is why we are opposed to the idea that _all great men have been criminals_ (only in the grand style, and neither petty nor pitiful), that crime must be inherent in greatness (this at any rate is the unanimous verdict of all those students of human nature who have sounded the deepest waters of great souls). To feel one's self adrift from all questions of ancestry, conscience, and duty--this is the danger with which every great man is confronted. Yet this is precisely what he desires: he desires the great goal, and consequently the means thereto.

737.

In times when man is led by reward and punishment, the class of man which the legislator has in view is still of a low and primitive type: he is treated as one treats a child. In our latter-day culture, general degeneracy removes all sense from reward and punishment. This determination of action by the prospect of reward and punishment presupposes young, strong, and vigorous races. In effete races impulses are so irrepressible that a mere idea has no force whatever. Inability to offer any resistance to a stimulus, and the feeling that one must react to it: this excessive susceptibility of decadents makes all such systems of punishment and reform altogether senseless.

The idea "amelioration" presupposes a normal and strong creature whose action must in some way be balanced or cancelled if he is not to be lost and turned into an enemy of the community.

738.

The effect of prohibition. Every power which forbids and which knows how to excite fear in the person forbidden creates a guilty conscience. (That is to say, a person has a certain desire but is conscious of the danger of gratifying it, and is consequently forced to be secretive, underhand, and cautious.) Thus any prohibition deteriorates the character of those who do not willingly submit

themselves to it, but are constrained thereto.

739.

"Punishment and reward."--These two things stand or fall together. Nowadays no one will accept a reward or acknowledge that any authority should have the power to punish. Warfare has been reformed. We have a desire: it meets with opposition: we then see that we shall most easily obtain it by coming to some agreement--by drawing up a contract. In modern society where every one has given his assent to a certain contract, the criminal is a man who breaks that contract. This at least is a clear concept. But in that case, anarchists and enemies of social order could not be tolerated.

740.

Crimes belong to the category of revolt against the social system, A rebel is not punished, he is simply suppressed. He _may_ be an utterly contemptible and pitiful creature; but there is nothing intrinsically despicable about rebellion in fact, in our particular society revolt is far from being disgraceful. There are cases in which a rebel deserves honour precisely because he is conscious of certain elements in society which cry aloud for hostility; for such a man rouses us from our slumbers. When a criminal commits but one crime against a particular person, it does not alter the fact that all his instincts urge him to make a stand against the whole social system. His isolated act is merely a symptom.

The idea of punishment ought to be reduced to the concept of the suppression of revolt, a weapon against the vanquished (by means of long or short terms of imprisonment). But punishment should not be associated in any way with contempt. A criminal is at all events a man who has set his life, his honour, his freedom at stake; he is therefore a man of courage. Neither should punishment be regarded as penance or retribution, as though there were some recognised rate of exchange between crime and punishment. Punishment does not purify, simply because crime does not sully.

A criminal should not be prevented from making his peace with society, provided he does not belong to the race of criminals. In the latter case, however, he should be opposed even before he has committed an act of hostility. (As soon as he gets into the clutches of society the first operation to be performed upon him should be that of castration.) A criminal's bad manners and his low degree of intelligence should not be reckoned against him. Nothing is more common than that he should misunderstand himself (more particularly when his rebellious instinct--the rancour of the _unclassed_--has not reached consciousness simply because he has not read enough). It is natural that he should deny and dishonour his deed while under the influence of fear at its failure. All this is quite distinct from those cases in which, psychologically speaking, the criminal yields to an incomprehensible impulse, and attributes a motive to his deed by associating it with a merely incidental and insignificant action (for example, robbing a man, when his real desire was to take his blood).

The worth of a man should not be measured by any one isolated act. Napoleon warned us against this. Deeds which are only skin-deep are more particularly insignificant. If we have no crime--let us say no murder--on our conscience; why is it? It simply means that a few favourable circumstances have been wanting in our lives. And supposing we were induced to commit such a crime would our worth be materially affected? As a matter of fact, we should only be despised, if we were not credited with possessing the power to kill a man under certain circumstances. In nearly every crime certain qualities come into play without which no one would be a true man. Dostoievsky was not far wrong when he said of the inmates of the penal colonies in Siberia, that they constituted the strongest and most valuable portion of the Russian people. The fact that in our society the criminal happens to be a badly nourished and stunted animal is simply a condemnation of our system. In the days of the Renaissance the criminal was a flourishing specimen of humanity, and acquired his own virtue for himself,--Virtue in the sense of the Renaissance--that is to say, _virtù;_ free from moralic acid.

It is only those whom we do not despise that we are able to elevate. Moral contempt is a far greater indignity and insult than any kind of crime.

741.

Shame was first introduced into punishment when certain penalties were inflicted on persons held in contempt, such as slaves. It was a despised class that was most frequently punished, and thus it came to pass that punishment and contempt were associated.

742.

In the ancient idea of punishment a religious concept was immanent, namely, the retributive power of chastisement. Penalties purified; in modern society, however, penalties degrade. Punishment is a form of paying off a debt: once it has been paid, one is freed from the deed for which one was so ready to suffer. Provided belief in the power of punishment exist, once the penalty is paid a feeling of relief and lightheartedness results, which is not so very far removed from a state of convalescence and health. One has made one's peace with society, and one appears to one's self more dignified pure.... To-day, however, punishment isolates even more than the crime; the fate behind the sin has become so formidable that it is almost hopeless. One rises from punishment still an enemy of society. Henceforward it reckons yet another enemy against it. The _jus talionis_ may spring from the spirit of retribution (that is to say, from a sort of modification of the instinct of revenge); but in the Book of Manu, for instance, it is the need of having some equivalent in order to do penance, or to become free in a religious sense.

743.

My pretty radical note of interrogation in the case of all more modern laws of punishment is this: should not the punishment fit the crime?--for in your heart of hearts thus would you have it. But then the susceptibility of the particular criminal to pain would have to be taken into account. In other words, there should be no such thing as a preconceived penalty for any crime--no fixed penal code. But as it would be no easy matter to ascertain the degree of sensitiveness of each individual criminal, punishment would have to be abolished in practice? What a sacrifice! Is it not? Consequently ...

744.

Ah! and the philosophy of jurisprudence! That is a science which, like all moral sciences, has not even been wrapped in swaddling-clothes yet. Even among jurists who consider themselves liberal, the oldest and most valuable significance of punishment is still misunderstood--it is not even known. So long as jurisprudence does not build upon a new foundation--on history and comparative anthropology--it will never cease to quarrel over the fundamentally false abstractions which are fondly imagined to be the "philosophy of law," and which have nothing whatever to do with modern man. The man of to-day, however, is such a complicated woof even in regard to his legal valuation that he allows of the most varied interpretation.

745.

An old Chinese sage once said he had heard that when mighty empires were doomed they began to have numberless laws.

746.

Schopenhauer would have all rapscallions castrated, and all geese shut up in convents. But from what point of view would this be desirable? The rascal has at least this advantage over other men--that he is not mediocre; and the fool is superior to us inasmuch as he does not suffer at the sight of mediocrity. It would be better to widen the gulf--that is to say, roguery and stupidity should be increased. In this way human nature would become broader ... but, after all, this is Fate, and it will happen, whether we desire it or not. Idiocy and roguery are increasing: this is part of modern progress.

747.

Society, to-day, is full of consideration, tact, and reticence, and of good-natured respect for other people's rights--even for the exactions of strangers. To an even greater degree is there a certain charitable and instinctive depreciation of the worth of man as shown by all manner of trustful habits. Respect for men, and not only for the most virtuous, is perhaps the real parting of the ways between us and the Christian mythologists also have our good share of irony even when listening to moral sermons. He who preaches morality to us debases himself in our eyes and becomes almost comical. Liberal-mindedness regarding morality is one of the best signs of our age. In cases where it is most distinctly wanting, we regard it as a sign of a morbid condition (the case of Carlyle in England, of Ibsen in Norway, and Schopenhauer's pessimism throughout Europe). If there is anything which can reconcile us to our own age, it is precisely the amount of immorality which it allows itself without falling in its own estimation--very much the reverse! In what, then, does the superiority of culture over the want of culture consist--of the Renaissance, for instance, over the Middle Ages? In this alone: the greater quantity of acknowledged immorality. From this it necessarily follows that the very _zenith_ of human development _must_ be regarded by the moral fanatic as the _non plus ultra_ of corruption (in this connection let us recall Savonarola's judgment of Florence, Plato's indictment of Athens under Pericles, Luther's condemnation of Rome, Rousseau's anathemas against the society of Voltaire, and Germany's hostility to Goethe).

A little more fresh air, for Heaven's sake! This ridiculous condition of Europe _must_ not last any longer. Is there a single idea behind this bovine nationalism? What possible value can there be in encouraging this arrogant self-conceit when everything to-day points to greater and more common interests?--at a moment when the spiritual dependence and denationalisation, which are obvious to all, are paving the way for the reciprocal _rapprochements_ and fertilisations which make up the real value and sense of present-day culture! ... And it is precisely now that "the new German Empire" has been founded upon the most thread-bare and discredited of ideas--universal suffrage and equal right for all.

Think of all this struggling for advantage among conditions which are in every way degenerate: of this culture of big cities, of newspapers, of hurry and scurry, and of "aimlessness"! The economic unity of Europe must necessarily come--and with it, as a reaction, the pacivist movement.

A pacivist party, free from all sentimentality, which forbids its children to wage war; which forbids recourse to courts of justice; which forswears all fighting, all contradiction, and all persecution: for a while the party of the oppressed, and later the powerful party:--this party would be opposed to everything in the shape of revenge and resentment.

There will also be a war party, exercising the same thoroughness and severity towards itself, which will proceed in precisely the opposite direction.
